PURITANISM, a term with a wide variety of connotations, is applied most often to those group movements of the sixteenth and seventeenth centuries in England and the United States which attempted to arrive at a purified version of Reformation teaching. The core of Lutheran doctrine had been insistence on immediate contact between the individual soul and God. Puritanism endeavored to remove all hindrances to this contact. It distrusted hierarchical ecclesiastical organization and elaborate ceremonies and vestments, and was disposed to seek guidance solely in the teaching of the Bible and to deny the value of ecclesiastical tradition.

The term Puritan first appeared in England about 1566. In 1567 a secret conventicle met at Plumbers' Hall in London to use the Genevan order of service instead of the *Book of Common Prayer*. A foreign observer wrote from London in 1568 that there had been discovered "a newly invented sect, called by those who belong to it 'the pure or stainless religion.' " The Puritans began by criticizing ecclesiastical vestments and ritual and by expressing a preference for Calvinistic dogma. They then passed to a criticism of the existing system of church government. During the session of 1576 the House of Commons, which was becoming Puritan in sympathy, considered an abortive scheme for transferring ecclesiastical authority from the crown and bishops to more democratic bodies. After 1580 Presbyterian organization increased, and the units known as "classes" were established in various parts of the country. There occurred also a growth in the numbers and pretensions of the Independent sects. In 1575 the Spanish ambassador referred to the presence of Anabaptists and "many other sects" in London, and in 1581 Browne and Harrison set up an independent, self-governing congregation at Norwich. Opposition to the bishops became more violent and in 1588 the scurrilous *Martin Marprelate* tracts were published. By the end of the sixteenth century the main lines of the historical development of English Puritanism were laid down. In comparison with its continental and Scottish prototypes it implied rather a way of life

and habit of mind than a fixed and definite doctrine and system of church government. Presbyterianism and Independency, the latter itself a comprehensive term, counted among their adherents only a part of the total number of English Puritans.

By the end of Elizabeth's reign it had already become apparent that Puritanism had special affinities with certain sections of the community. It struck its deepest roots among the rising middle classes, who were conscious of their growing importance in the state and eager to remove whatever barriers stood in the way of a full development of their powers. The reason for this affinity is not easy to discover or define. It was due possibly to the attraction felt between broadly similar ideals and interests. Puritanism, with its insistence on the importance of the individual and on the expression of faith through a righteous and industrious way of life, found a natural home among those classes which were engaged in carving out an improved position for themselves. Again, the affinity may have been due to the fact that Puritanism was to them an enchanted mirror, in which they saw an enhancement of their own particular virtues. Whatever the cause of the connection, its consequences were far reaching.

The importance of this connection became apparent first in the political sphere. During Elizabeth's reign it was noticeable that the most stalwart champions of parliamentary rights were the Puritan members of the House of Commons. This was partly because the Puritans hoped to introduce a reformed religious polity by means of parliamentary legislation. In 1576 Peter Wentworth, one of the Puritan members, was committed to the Tower by order of the House itself for making a too outspoken plea for freedom of speech in Parliament and for criticizing the power of the bishops. In 1587 he again spoke on similar lines in support of the proposals for alteration of the prayer book brought forward by another Puritan member, Cope. As a result of an interview with the Privy Council, Wentworth, Cope and three other members were ordered to the Tower. The House of Commons

as a whole began to show itself increasingly Puritan in sympathy. In 1584 it drew up a petition for ecclesiastical reform which revealed Presbyterian tendencies and which questioned the legality of the proceedings carried on by the Court of High Commission against Puritan offenders. By the beginning of James I's reign the connection between Puritanism and parliamentarianism was widely discernible. The king greatly increased both his religious and his political difficulties by adopting an intransigent attitude toward the Millenary Petition and the Hampton Court Conference. Parliament supported the petitioning ministers in 1604 and in 1610 reiterated its request for a purification of religion and the abolition of the Court of High Commission. When James turned a deaf ear, Parliament retaliated by refusing or stinting supplies. The bishops, already criticized in their ecclesiastical capacity, now became doubly hateful as champions of the royal prerogative in opposition to parliamentary claims. During the eleven years of personal government discontent with the government's ecclesiastical policy spread. Using the weapons of the Court of High Commission and the Metropolitan Visitation, Laud endeavored to enforce complete religious conformity. In doing so he frequently violated individual liberties and roused indignation among men outside the Puritan ranks. The fusion of political and religious grievances did much to precipitate the civil war.

In the social and economic sphere the affinity between Puritanism and the middle classes was particularly well marked and significant. While Puritanism was widely diffused and was not peculiar to any one class or locality, it is evident that its most numerous and enthusiastic adherents were among the middle trading classes. Roland Usher in *The Reconstruction of the English Church* (2 vols., New York 1910) has conducted a statistical inquiry into the distribution of Puritan ministers in England in the first decade of the seventeenth century. Of the 281 ministers whose names are known 35 belonged to London and Middlesex, where a very large proportion of the middle trading classes were congregated; 96 to the important manufacturing counties of Norfolk, Suffolk and Essex; 29 to Northamptonshire, a county of prosperous farmers; 17 to Lancashire, which was becoming increasingly important as a center of the clothing industry; and only 104 to the rest of the country. Usher also estimates that the strength of the Puritan party lay chiefly in the economically ad-

vanced area of the southeast and midlands, showing its greatest strength in the weaving towns. This statistical evidence is confirmed and supplemented by contemporary opinions. "Freeholders and Tradesmen," said Richard Baxter, "are the Strength of Religion and Civility in the Land; and Gentlemen and Beggars and Servile Tenants are the Strength of Iniquity." The course of the civil wars in England made it unmistakably clear that Puritanism was strongest among the middle classes, especially in the towns. London supported the parliamentary cause vigorously and became known as "the rebellious city." The clothing towns of Lancashire were Puritan and parliamentary, despite the existence of a surrounding Roman Catholic countryside. In Yorkshire, Bradford, Leeds and Halifax; in the midlands, Birmingham and Leicester; in the west, Gloucester, Taunton and Exeter, were all Puritan strongholds. Puritanism was therefore strongest among those classes which for economic reasons objected to the restrictions imposed by monarchical and Anglican rule. Thus spiritual conviction and economic interest reacted upon and reinforced each other.

Puritanism was a factor common to the most vigorous opponents of prerogative power in politics, religion and trade. Its binding influence helped to unite the different parties and interests against a common foe and to give them a zeal which they might otherwise have lacked. Broadly speaking, the ideal of the Stuart government rested on a conception of divinely appointed kingly power, exercised arbitrarily for the good of the state in all departments of life. To this, Puritanism opposed the ideal of vigorous, untrammelled individualism, expressing itself freely in the House of Commons, throwing off restrictions in trade and commerce, and dispensing with traditional forms of authority in religion, although the conception of full religious freedom was not to develop until later. The whole theory and practise of monopolistic power was criticized, but the sphere in which it was attacked most vigorously was that of industry and trade. The custom of granting monopolies in the manufacture or sale of commodities was an important part of Stuart economic policy. While the grants were made with varying intentions, some of which were good, the economic consequences were nearly always disastrous. When the Long Parliament met these monopolies were attacked, some of them were called in and the system never regained its old vigor. In

politics, the concentration of power in the hands of the ruler and a small circle of advisers had to give way before the claims of a partially representative Parliament, and some of the paper constitutions of the Interregnum attempted to diffuse the powers of government even more widely. In religion, the powers of the bishops were attacked by Puritans of all shades of opinion. John Lilburne in *England's Birth-Right Justified* (London 1645) and *London's Liberty in Chains Discovered; a Postscript Written in the Tower of London* (London 1646) traced a direct connection between the three main types of monopoly—that of the trading concerns, the Anglican church and the Stuart government—and declared that each bolstered up the others.

In 1649 Puritanism triumphed. Until then it had been concerned mainly with the work of destruction and had been able to unite various elements within itself. Now it became apparent that it was not homogeneous. At one end of the scale was Presbyterianism, which represented stringent control on a democratic basis. At the other was Independency, which stood for individualism in all its various forms. In between were men of a Puritan trend of opinion who refused to group themselves definitely under either party, but who would be influenced by whichever group gained the strongest position. Because of uncongenial features in English social stratification and political development Presbyterianism failed to establish itself, despite the efforts of the Scots. Independency, on the other hand, attained a wide and enduring influence. Although the monarchy and the Anglican church were restored in 1660, Independent Puritanism persisted as a religion and still more as a way of life and type of outlook. In the political sphere its main influence was ended. It had helped to bring about a rebellion whose chief objectives were successfully obtained and retained. Future lines of political development owed little to the direct influence of Puritanism. In the religious sphere it combined with other factors to secure greater toleration. In the economic and social sphere its influence was exceedingly important. A particular type of character and way of life received a powerful stimulus. Puritanism now gave an unqualified blessing to the middle class individualistic and economic virtues. The attraction already felt between Puritanism and the middle trading classes increased after the victory of Independency, despite a temporary democratic outburst during the Interregnum on the part of some of the more extreme sects. An

austere way of life and devotion to a "calling" which should be crowned with moderate worldly success became at once the ideal and the hallmark of Puritans and of many others who adopted their view of life. The reverse of this ideal was an attitude of stern reprobation toward those who failed to achieve such success. Poverty and failure, like frivolity and idleness, appeared the outward manifestations of an unregenerate soul. It is not surprising that in the eighteenth century many of the pioneers of the industrial revolution were nonconformists.

The influence of English Puritanism was not confined to England. In the early seventeenth century the colonization of America was carried out mainly by Puritan settlers. The motives for colonization were mixed, the economic motive playing an important part. Following upon the economic changes of the sixteenth century a certain displacement of population had taken place, particularly in the more advanced economic areas, where Puritanism was strongest. As in England, it was the role of Puritanism to act as a binding force and motive power among the settlers. In New England, it was possible for the Puritans to develop their ideals unhindered in a peculiarly favorable environment which put a premium on the Puritan virtues. The soil was hard to cultivate but moderately fertile, the climate fairly severe. To the west lay a great continent with vast resources to be discovered and exploited. In such an environment the skilled and strenuous workman who represented the Puritan ideal would flourish, while the idle or incompetent would go to the wall. In later years unfettered individualism carried all before it, but in the early period of the New England settlements the side of Puritanism which favored stringent control was dominant. This was due partly to the exigencies of the situation, partly to the religious zeal of the leaders. For a small band of settlers in unknown territory surrounded by enemies it was expedient to pool resources and set limits to individual enterprise. Membership in the state was synonymous with membership in the church, and in his double capacity as citizen and church member every individual was criticized and controlled. Industry was enforced upon all settlers, but it had to be carried on for the good of the whole. Acts regulating wages were to be found in almost all the Puritan colonies. In Boston markets and sometimes gristmills were publicly regulated. The Massachusetts government attempted to impose a just price for all essential

commodities. But from the first such regulations were difficult to enforce; and theocracy in Massachusetts was weakened by the terms of the new charter of 1692, which substituted a property qualification for church membership as a basis for the franchise.

As in England the aspect of Puritanism which encouraged individual freedom triumphed. In the religious sphere this triumph was marked by the spread of Congregationalism. In the social and economic sphere it was marked by the development of economic individualism, backed consciously or unconsciously by religious sanctions and fostered by a growth in economic prosperity and general security which decreased the necessity for collective control. The representative attitude is illustrated in the works of Benjamin Franklin, the son of a zealous Puritan and himself influenced by the general Puritan outlook. Franklin lays down a series of maxims stressing the importance of profitable industry, and when asked why money should be so important replies with a Biblical quotation: "Seest thou a man diligent in his business? He shall stand before kings" (*Advice to a Young Tradesman*, Philadelphia 1748; also *Autobiography*, ed. by F. W. Pine, New York 1912). This religious sanction of profitable industry, with the feeling of assurance and stimulus which it gave, exercised an important influence on entirely secular men and activities and may be reckoned as one of the formative influences in the development of the modern American conception of business.

PUTNAM, FREDERIC WARD (1839-1915), American anthropologist. With practically no formal academic background, Putnam came under the influence of Agassiz, from whom he learned his methods of thorough inductive research. His interest shifted from ichthyology to American archaeology and ethnology and in 1874 he became curator of the Peabody Museum at Harvard University, where he remained for forty years. There he revolutionized American museum methods by inaugurating scientific expeditions; he emphasized that the methods of these expeditions should be determined not by the quantity of specimens to be secured but by their scientific objectives. The excellent museum collections which he assembled manifest the variety of his interests in the history of mankind. Among the most outstanding are those on the antiquity of man in America: materials from the mound and village sites in Ohio and Wisconsin; extensive collections from Mexico and Central America; and archaeological and ethnological collections of old New England. Putnam was appointed professor of American archaeology and ethnology at Harvard in 1886. In 1891 as chief of the ethnological section of the World's Columbian Exposition in Chicago he was instrumental in founding the Field Museum of Natural History and stimulated other institutions to carry on intensive field work among the American Indians. After the exposition he organized the anthropological work of the American Museum of Natural History, where between 1894 and 1903 he extended field investigations beyond the limits of North America and developed a comprehensive program of active scientific research. He was largely responsible for the foundation of the department of anthropology at the University of California, becoming professor and director of the anthropological museum in 1903.

Putnam's scientific activities were not confined to anthropology. As permanent secretary for twenty-five years, beginning in 1873, of the American Association for the Advancement of Science and as president of this organization in 1898 he played a significant role in shaping the policies of the association and in promoting the influence of science in the United States.

PUTTER, JOHANN STEPHAN (1725-1807), German jurist. Putter is undoubtedly the most important expounder of the public law of the old Reich. With almost unbelievable energy Moser had not long before assembled and organized the mass of legal material, but in this form it remained hardly more than laboriously heaped cyclopean blocks. In the work of Putter, on the other hand, the law appears disentangled from its difficulties, in a form which by virtue of its grace, rationality and elegance rises above the ponderous structure of the old Reich. Certainly, by virtue of his spiritual depth, the firmness of his Christian faith as well as his saturation with the ideals of the old liberties Moser is closer to the mediaeval foundations of the Reich. But since these had been displaced in the territorial state, in which princely absolutism, imbued with utilitarianism, had undermined antiquated institutions, it is Putter not Moser who seems to have been the true oracle of the times.

In the field of public law, in which he made his chief contribution, Putter had separated constitutional from administrative law and then had treated the particular branches of administration as parts of a highly lucid system. In his method he became the founder of juristic dogmatism, which later had its positivistic echo in Laband, and thus represents the beginning of modern theory. In the field of the private law of the princely houses, which interested him particularly, Putter's strict conception of the principle of equality of birth had important influence. His description of the imperial law of procedure, the hopeless impotence of which he demonstrated, was definitive. Finally Putter's works on imperial history, which he treated by way of introduction to the public law of his time, are noteworthy not only because of their complete mastery of the material but also because of their literary quality.

In the field of civil law Putter rendered a service in his insistence on a clear separation of its Germanic and Roman elements, the confusion of which he deplored. In natural law he appears more as a follower of Wolff than as a philosophical thinker but again shows that ability to draw distinctions which lends value to his juristic encyclopaedia. To his wealth of scientific

accomplishments must be added his practical work and his lectures at the University of Göttingen, which contributed to its glory and brought him a circle of pupils of unusual importance.

PUTTING OUT SYSTEM is the term which is coming to be used by economic historians to designate that stage of economic organization commonly known as the domestic system, or in German and French *Hausindustrie* and *industrie à domicile*. As descriptive of a stage of economic organization, these terms have long been regarded as unsatisfactory, since they stress one feature, work at home, which likewise characterizes all the stages of economic development except the factory system. German writers, following Karl Bucher's initiative, therefore substituted *Verlag* for *Hausindustrie*, while English and American writers are adopting the term "putting out," which formerly was in common usage in those districts of England where this type of organization was prevalent.

Following Lieftmann's acute analysis, his emphasis upon the character of the labor contract may be accepted as basic to the history of the confusingly varied forms of this industrial institution. The self-directing worker of the putting out system agrees to do, or to have done by those he hires, work which has been entrusted to him by one who plans to sell the product. This distinguishes him from the handicraftsman, who makes his product for sale or to the order of a consumer. It also distinguishes his liberty of economic action, even if he becomes increasingly dependent upon one employer, from the lack of economic self-direction of the worker subordinated to factory discipline. In theory it is immaterial whether the industrial

producer to whom work is put out be only a single workman or one of many or a great modern concern, such as a bleachery or a dyeing or cleaning establishment working on material entrusted to it by a trader. The size of capital employed, whether by the putter out or by the worker, is also immaterial to the definition, although in its historical development the rise and spread of the system may be attributed largely to the relative wealth of the merchant industrialist who employed, and to the poverty of the majority of workers who competed for employment. In fact, however, some of the modern forms of the system where conditions are most unfavorable for the workers, such as the sweatshops of the clothing trade, are precisely those which require but a minimum of capital.

That the work should be carried on in the worker's own or rented home or workshop is characteristic of the putting out system, as it is of the handicraft and country household systems which historically preceded and accompanied its growth. But it is not a necessary characteristic; especially in the later period, it was not uncommon for putting out workers to rent a seat or the use of a machine, not only in shops erected for the purpose by those outside the industry or by another worker but even in the employer's own workshop or factory. Such cases as those described in the parliamentary reports of 1806 and 1840, in which hand loom weavers working in the owner's premises were free to "come and go when they like," or those reported from the Swiss embroidery industry, where machine workers in the employer's factory were bound by no factory discipline or factory legislation, or the sub-contracting system within the factories of the English metal industries, were (and perhaps are) probably more frequent than inadequate observation has recorded.

The distinction between workers under the putting out system and handicraftsmen is of particular importance for an understanding of the later periods of the handicraft system, when, with the widening market and the increasing surplus of handicraftsmen, they turned in larger numbers from production primarily for local consumers to regular production for the outside market, selling their wares to merchants or their agents. Such handicraftsmen—to whose appearance the term "wholesale handicraft" applied by N. S. B. Gras to the entire stage here under discussion should properly be narrowed—might for a period seek out the wholesalers by long journeys to a distant market. Ordinarily, however,

the wholesalers soon came to some market town convenient to the handicraftsmen, who could then congregate for sale of their staple wares at stated days and hours. This was long the custom at Leeds, the market for the West Riding woolen makers, the picturesque description of which by Defoe has so colored subsequent English writing on the "domestic system." A similar long maintenance of the wholesale handicraft system, with handicraftsmen dependent upon their regular sales to merchants, characterized the gradual emergence from the guild system in a number of industries both in England and on the continent.

When, however, as was the case as early as the thirteenth and fourteenth centuries in the southern Netherlands and northern Italy, the high development of certain luxury trades made necessary considerable trading capital and expert knowledge, the function of the merchant or market specialist was greatly enhanced. Or when the refinement or changeability of demand called for elaboration of existing patterns or introduction of new wares, as ultimately occurred in the Yorkshire woolen industry, or when the substitution of a wage payment to putting out workers instead of a price to a handicraftsman promised greater profit, the trader tended to become also an employer. The pressure for control over the industrial process marked the inception of the new system and its whole subsequent development.

The transformation took place gradually and in manifold adaptations of form. There was opposing guild legislation, but in the main the new system seems to have become ensconced, in suitable industries and places, without at first seriously upsetting the established order. Although its spirit of initiative, risk taking and profit seeking was alien to the social ideals of subsistence, security and equality of economic opportunity which animated the craft guild, and, although ultimately, from both within and without, it was to be largely instrumental in undermining and destroying the guild system, in its first beginnings it appeared to contemporaries to fit into the existing economic and social situation. It used the traditional technical methods; it employed handicraftsmen already habituated both to work to the order of local consumers and to seek the merchant's skill in outside marketing; and it relieved the growing pressure upon poor workers, craftsmen or others pressing into the towns, who found themselves unable to wait from one uncertain market day to another. The new contract frequently assumed the old form;

indeed it often continued in Germany to be called a *Kauf*. The putter out might sell the raw material, as if it were a sale to a handicraftsman, but with the condition that the worker must sell the finished product exclusively to him, presumably at a price specified in advance. Frequently the raw material was sold at a price to be paid by the worker as a deduction from the predetermined price of the finished product when he returned it. This practise, which converted a handicraftsman's price into the equivalent of a putting out wage payment, is found in one of the earliest cases of putting out to be recorded in detail - that of Jehan Boine Broke at Douai, active between 1270 and 1300.

The merchant often penetrated into the shell of the guild system, and there used a dominant position to subordinate and integrate the formerly independent crafts. Such was the history of one of the greatest of the Florentine craft guilds, the *arte della lana*, in which the woolen masters, probably, as Davidsohn suggests, rising from the status of weavers to that of entrepreneurs, managed by the putting out system all the interlocked processes in the industry. Such was also the final outcome of the long struggle whereby the merchants at Lyons in the seventeenth century secured the control of the silk weavers' guild. In other cases the entrepreneur dealt with the guild from the outside. Craft guilds made collective bargains with the putter out, such as the series of contracts in the sixteenth and seventeenth centuries between the merchant entrepreneurs of Nuremberg and Leipsic and the linen weaver guilds of towns in eastern Germany, where the putters out (named as *Verleger* in the contracts) agreed with the guild to take the total annual production of its members or a certain stipulated quantity, at a price fixed for the year, and to make a cash advance to enable the poor weavers, among whom the order was divided, to buy their raw materials, the weavers pledging themselves to work for no other merchants.

It is proper to speak of these organizers of industry as merchants, since that was their essential function. But the impetus to the establishment of the putting out system and the subsequent recruiting of its leaders came largely from the more energetic and ambitious craftsmen. An interesting case is that reported fully by Gothein from Freiburg i. Br. Here in the midst of a busy community occupied in the cutting and polishing of semiprecious stones, in which the small handicraftsmen were strongly organized

for an export trade under typical guild regulations, there appeared among the craftsmen, early in the sixteenth century, a gifted innovator named Hans Scher. His invention of hollow boring brought him more orders than he could fill. When he began on a considerable scale to employ his fellow craftsmen as putting out workers, he was banished; but when he set up a rival establishment in a neighboring village, his recall to Freiburg resulted in the acceptance of the new industrial form and the decay of the guild.

The diffusion of the industrial population from the towns to the countryside with the decline of the feudal system and the growth of state protected security brought a wide extension both of wholesale handicraft and of the putting out system. Since any quantitative evidence is absent and much of the descriptive material is vague, the relative importance of these two groups in the sixteenth to eighteenth centuries cannot be determined. They overlapped and intermingled. There were marked regional differences; notably in Germany, because of its slower economic development after the sixteenth century, the handicraft system and its protective institutional framework, the guild, remained strong while they declined elsewhere. Generally speaking, the handicrafts persisted in the industries concerned primarily with local consumption and in those marketing certain staple goods. The appearance of new industries with no guild tradition; the new requirement of industries, like mining, for large capital investment; the industrial employment of the country workers and especially the unprecedented call upon the labor of women and children; the pressure for large scale deliveries to governments engaged in frequent wars, a factor noted by Sombart; and above all the enormous rise in prices, rapidly mounting for nearly a century after 1550 in central and northern Europe and seriously depressing wages and the condition of labor, all these changes were elements which favored the spread of the putting out system.

The outstanding characteristic of the system in its expansion is the tendency toward increasing control over the worker. Since he is ordinarily working outside the employer's premises, his work cannot easily be supervised, and the employer's losses, by waste and embezzlement of materials, are the subject of perennial complaint. Since he is self-directing, he is free to shift from employer to employer at the conclusion of any specified task, and within certain

technical limits he can work when, where and how he pleases—conditions highly regarded by workers in a period of growing individualism. The competition among employers for workmen was on the whole outbalanced by the competition among workers for employment. The result was a readily explicable effort to keep the worker in dependence. Holding him in a chain of debt was common. At Lyons, for instance, the municipal regulations held that a silk weaver could not change to a new employer unless his debt to the old was paid or transferred with the old employer's consent. The worker's tools had usually been his own property, but later he found himself tied to the employer by rented tools or machines or even a rented house. Because of the increasing economic pressure all his family had to work long hours. No social condemnation or public regulation checked child labor. On the continent as well as in England there was a fair amount of legislation on wages which appears, however, to have been largely ineffectual, and the legislative prohibition of truck payment, which gave the employer an opportunity for a double profit, was only sporadically effective. Josiah Tucker, comparing in 1757 the condition of the putting out workers in the woolen industry of southwestern England with that of the handicraftsmen of Yorkshire, declares that the southern system tempts the master "to consider his people as the scum of the earth, whom he has a right to squeeze whenever he can, because they ought to be kept low, and not to rise up in competition with their superiors." To the hopeless situation of the workers ("they shall always be chained to the same oar and never be but journeymen") he traces their drunkenness, their proclivity to mobs and rioting and their belief that it is no crime to cheat the master, their common enemy. The regime of the putting out system brought no golden age. It inaugurated the widespread employment of women and children in industry; it helped to strengthen the mercantilistic predilection for grinding work and low wages for "the laboring poor"; and it was largely accountable for the growth of conscious opposition of class interests, as between employer and employed.

Against these disadvantages for the laborer there were some attractions which the system offered him. Entrance to employment became easy as apprenticeship regulations relaxed or disappeared. The family could work and live together. There were possibilities of removal to better paid branches or to more inviting regions

of employment. There were relaxations of pressure during the prosperity phases of business fluctuations. In the countryside or even in the spreading towns, until population grew, there was often a bit of land with the laborer's cottage, which added somewhat to income and to change of occupation; there was also a chance of extra earnings at harvest time. Above all, the deep rooted desire for economic liberty, however illusory, survived the attacks upon the worker's independence. The artisan was extremely loath to endure the iron discipline of the factory and strove bitterly, as the long and persistent struggle of the hand loom weavers showed, against its encroachments.

To the entrepreneur the system gave wider scope than had before been possible, even under the wholesale handicraft system, for the profits of a relatively more coordinated industrial organization. It offered opportunity to men of small means, and for a placement of capital, for the most part circulating rather than fixed, which was comparatively safe at a period when capital was timorous and credit poorly organized in the greater part of Europe. This was especially pertinent in the frequent and serious business depressions, the burden of which could to a large extent be thrown upon labor. But with the growth of business security and opportunity the disadvantages inherent in the system became more obvious. The wastes of time, with the carriage back and forth of materials through the successive steps of manufacture, and of materials entrusted to scattered, careless and pilfering workers, were distressing; the difficulties of supervision, despite all efforts, were great; and the obstacles to the introduction of new methods, such as the subdivision of labor, or of new machinery seemed practically insurmountable. Furthermore, the expansion of demand for industrial products both in quantity and quality, which marked the advance of the eighteenth century, made increasingly evident the serious limitations upon the growth of enterprise. Attempts were made to seek new supplies of labor farther afield, with branch depots under factors or sub-putters out, or to concentrate the putting out workers in the employer's workshop and even to equip them with power and machinery. These efforts succeeded in maintaining the declining system in some regions and industries; indeed in a few cases, such as the Swiss embroidery industry and the Crefeld silk manufacture, it has won ground back from the factory. The machines in these instances have been moved to the

workers' homes or workshops, and in considerable measure the control of hours and conditions of labor has bettered the present day lot of the putting out worker. But in the last half century the putting out system, except in India and China, where it remains strong, has given way to the superior discipline and efficiency of the modern factory. In European countries and in the United States it has survived in the form of sweated industries, such as the clothing and needlework trades, chiefly in the slums of great cities, or in processes ancillary to factory production which employ town and country workers, mainly women and children. With the utilization of electrical power, however, and the consequent decentralization which that makes possible, some revival of the putting out system may be attempted. If one of the major stages of industrial organization should thus receive a new lease of life, it will demand close study to insure the provision of adequate social safeguards which its history shows to be essential.

PYM, JOHN (1584-1643). British parliamentarian. Pym sat in Parliament from 1614 until his death and during the Long Parliament played a conspicuous part as unacknowledged leader of the House of Commons. Both in his parliamentary speeches and in his actions Pym displayed a firm belief in parliamentary sovereignty based on popular consent and in the liberties of the subject. Despite his support of the Root and Branch bill as a bid for Scottish cooperation he preferred a moderate Erastian church policy with Parliament rather than the king in control. As a trained lawyer he helped to maintain the authority of the law of the land as administered by the courts of common law. Pym's convictions not only forced him into direct opposition to the early Stuart system of royal absolutism, which he wished to reduce to a limited monarchy, but threw upon him the burden of constructing a machinery of parliamentary government to take the place of the existing system dominated by the king. In both tasks he was successful.

From 1621 onward he took the lead in organizing parliamentary resistance to the royal power. He saw the necessity of controlling the king's advisers as key positions of the executive and had an active hand in all the important impeachments of the period, notably that of Strafford. He insisted on redress of grievances before supply. By the abolition of the courts of Star Chamber and High Commission in 1641 he deprived the king of his most effective ad-

ministrative instruments. But greatest achievement was in forging a parliamentary executive machinery based on the committee system. He developed this hitherto desultory procedure to a high degree of efficiency, constituting committees both during and between sessions. This innovation and the bill forbidding the dissolution of Parliament without the consent of its members provided the continuity which was essential to a supreme executive body. Pym's genius for administration was responsible for the creation of the first executive of parliamentary sovereignty, which later developed into the cabinet system.

QUAKERS. Applied at first as an epithet of contempt evoked by manifestations of religious ecstasy, the term Quakers has become the accepted designation for members of the Society of Friends. Quakerism arose in England in the middle of the seventeenth century under the leadership of George Fox. In contrast to contemporary dissenting sects, its emphasis was not upon matters of theology and doctrinal interpretation but rather upon divine guidance in the life of the individual—the "inner light," or "Christ within." Quaker reaction against sacerdotalism and formalism found its expression in worship based on silence, the meeting of a group for divine communion without prearranged program, sermon or observance of outward rites. Holding that the will of God for the individual must take precedence over state laws, Quakers refused to pay tithes for the support of a state church because they considered the gift of God to be free, not mediated through a privileged class. They met to worship in their own way, although such worship was forbidden by law. They protested against luxury as oppressive to the poor and appealed to all to live simply for the sake of their less fortunate brethren. This desire for simplicity underlay the adoption of

the peculiar dress which was characteristic of Quakers as well as their "plain speech," that is, the use of "thee" and "thou" in place of the more formal pronoun. Insisting on one standard of truth in everything, speech as well as action, they refused to take even a judicial oath. For upholding such principles many thousands were imprisoned; yet their uncompromising stand was an important factor in the struggle for religious freedom in England. Despite persecution and oppression Quaker doctrines spread throughout the British Isles, reached New England as early as 1656, and other parts of the American colonies soon after.

This early period of intense religious activity lasting until about 1690 was followed by an interval of quietism, during which, although no formal creed or confession had been developed, rigid adherence to Quaker principles was expected of members. Those whose lives were not in accordance with the "discipline" of the society were "disowned," that is, denied the rights of membership. Nineteenth century Quakerism witnessed a relaxing of the discipline, followed by a gradual revival, a reaffirmation of practical mysticism and an increasing sense of the social implications of religion with emphasis upon organized philanthropy.

Before 1670 George Fox planned a democratic organization for the Quakers, which has been little altered. One or more congregations form a Monthly Meeting, which is the unit for managing the society's affairs in any one district. Several Monthly Meetings form a Quarterly Meeting and a number of Quarterly Meetings a Yearly Meeting, usually the national or state unit. Each Yearly Meeting, of which there are over thirty in the world, calls itself a Society (or Religious Society) of Friends. In the meetings for church affairs the clerk, who combines the offices of chairman and secretary, may be either a man or a woman (women share equally with men in all community activities, and have always taken an important part in the ministry of preaching). There is no voting, the meeting attempting by deliberation rather than debate to find the will of God in any matter. Within their own Society Quakers, or Friends, as they call themselves, care for their poor and needy and supervise the education of their members through educational institutions of various grades. Formerly they exercised a stringent supervision over the personal, social and business life of each member. Variations in emphasis on points of doctrine and in organization occur

among the branches of Quakerism in the United States, where a pastor and arranged services, with voting in business meetings, often replace the historic Quaker procedure.

Like other religious and reform movements, Quakerism was both an expression of the broader humanitarian tendencies of the eighteenth century and a factor in the resolution of those tendencies into concrete social reform. In the abolition of slavery, the protection of Indians and other backward races, the improvement of conditions in prisons and insane asylums, antimilitarist agitation and reconstruction work following wars as well as in general philanthropic endeavor Quakers have been pioneers.

On the American continent William Penn founded Pennsylvania as a refuge against persecution. While the Quaker regime in that colony endured, Indians were paid for their lands and received fair and equitable treatment at the hands of the whites. Quakers also took a prominent share in the administration of Rhode Island and of New Jersey, and liberty of conscience and democratic institutions were characteristic of their rule. But the Quaker would not force his beliefs upon others; when the majority became non-Quaker, Quaker administrators usually either compromised in matters relating to the military defense of the country or withdrew from the government.

Quakers were among the earliest opponents of slavery. By patient personal work, by appealing to the good in the oppressor as well as caring for the oppressed they eliminated slaveholding from among their own groups before the end of the eighteenth century and sought to influence public opinion in this direction. Many Quaker names are connected with the antislavery cause, notably that of John Woolman, who labored untiringly for all who were oppressed by the economic system, Anthony Benezet, who influenced Clarkson to make the abolition of the slave trade his life work, and later the poet Whittier.

Until one hundred years ago Quakers were chiefly middle class farmers and traders, most professions and the fine arts being closed to them either by law or by conviction. As shopkeepers they tended to engage in business relating to food, clothing and other essentials rather than in "luxury" trades. Believing there could be but one true price for an article, they refused to bargain. Hence there arose in England the custom of adhering to a set price for retail goods. The honesty and integrity of the Quakers

brought them popularity with their customers and constantly increasing trade; but if wealth came, it was used for the building up of larger businesses rather than for luxurious living. Their freedom from convention and stress on personal responsibility produced among them experimenters and inventors: in the iron industry, the Darbys; in pottery, Cookworthy; in science, Dalton and Eddington. The personal interest of Quaker employers in their employees and of traders in their customers arose from their belief in the spiritual value of each individual. In early Quaker households apprentices and servants were considered part of the family. Later, as big business concerns developed, practical attention was given to the welfare of employees. Bournville, near Birmingham, England, built for the employees of Cadbury Brothers is one well known example. Quakers have also made experiments in corporate undertakings for community welfare. John Bellers, "the pioneer of modern Christian socialism," published his *Proposals for raising a College of Industry* (London 1695, new ed. 1696; reprinted as *Industry brings Plenty*, 1916). Out of his suggestions grew Quaker experiments in industrial education at Clerkenwell and Bristol. During the next century William Allen, editor of the *Philanthropist*, a magazine devoted to social welfare, founded an industrial training colony for laborers at Lindfield, Sussex. Together with several other Quakers Allen also participated in Owen's experiment at New Lanark. At the present time Quakers are engaged both in England and in America in allotment and other schemes for helping the unemployed.

Other causes which early enlisted Quaker support were the education of the poor, as in the Lancastrian schools; penal reform, led by Elizabeth Fry and Peter Bedford, both of whom were opposed to capital punishment; humane treatment of the insane, as in the York Retreat founded in 1796 by William Tuke; and temperance reform. For the last two generations Quakers have carried on foreign missionary work, in which they have recognized the place of the educational and medical missionary alongside that of the evangelist. Formerly debarred from the universities and most public offices by their refusal to take an oath, they played little part in politics in England until the nineteenth century. In public life they have figured chiefly as pacifists and social reformers; among these Joseph Sturge and John Bright were outstanding.

Opposition to war has always been a distinctive Quaker doctrine, and in every war members of the sect have suffered for their refusal to fight. During the World War many Quakers were conscientious objectors; some accepted alternative non-combatant service, while others who took an absolutist position went to prison under conscription laws. A number of nominal Quakers who did not hold the peace principles of the society became soldiers. The Quakers' traditional peace testimony has, however, rested not merely on negative war resistance but also on an active promoting of reconciliation at all times and on the relief of distress attendant upon war. During the years 1914-18 Quakers cared for enemy aliens and their families, organized ambulance units, carried relief to civilians in war zones and as soon as it was feasible undertook reconstruction work in devastated areas. After the war they assumed, with generous public assistance, the burden of feeding the destitute children in Germany and Austria and of much reconstructive work in France, Poland and Russia.

Because of prevailing conscription laws under most governments Quakerism failed to gain any considerable following in Europe. At the present time it is estimated that there are fewer than 500 adherents of the faith on the continent. Quaker membership in the British Isles is approximately 22,000; in the United States 110,000; and in other parts of the world, chiefly Madagascar, Australia and New Zealand, 8000. Despite this numerical insignificance Quakerism has exerted a potent influence throughout the Christian world. Its strength has lain in the example set by thousands of ordinary men and women, who, in spite of many failures in practical obedience, have sought to follow the "light within" in their daily occupations. As a body they have been distinguished by their long tradition of religious tolerance and humanitarianism, and many of the causes in which they were pioneers have become world movements.

QUANTITY THEORY OF MONEY. See MONEY.

QUARRYING. Stone production, one of the most widespread of industries, present in every country in the world and in every state of the United States, is described incompletely by the term quarrying, which originally was applied to the production of stone blocks from surface operations, the principal activity a century ago and earlier, as distinguished from the shaft operations of metal mines. Today dimension stone is obtained from both open pits and slopes and shaft mines. Moreover mechanized production of stone for crushing with high explosives and power shovels at surface operations is similar to open pit mining of iron ore, the recovery of coal by stripping and the production of copper ore. The average annual output of stone of all kinds, including slate, in the United States for the five-year period 1927-31 was more than 176,000,000 short tons with an average annual value exceeding \$216,300,000. The production of unfinished stone alone in 1929, excluding non-commercial stone and stone used in the manufacture of lime and cement, ranked fifth among the mineral producing industries in total value of products and third in the number of wage earners employed; the tonnage was more than twice that of iron ore or of anthracite coal. This is indicative of the important part stone plays in the world of raw materials. Dimension stone is used not only in monuments and as a premier facing material for modern steel skyscrapers but in a wide variety of fields, such as electrical, lavatory and laboratory equipment; roofing; blackboards; art goods; decorative interiors; and road and bridge construction. In

crushed form, however, stone attains its greatest economic utility, the largest quantities finding outlets in road building, as concrete aggregate and as railroad ballast. The delivery of enormous tonnages of quarry products to markets is an important transportation item involving rail, water and truck haulage. Coal and oil used in quarries, mills, cement plants and limekilns account for an appreciable part of the total fuel supply, and the machinery and explosives required provide an outlet for factory goods.

Unlike most of the non-metals, stone has an important ancient history. Its use identifies a whole epoch in man's development, the stone age, when it served as material for tools and weapons. It provided man's earliest construction material, crude domestic equipment and ornaments, and upon it were recorded legal documents and artistic impressions. Stone was to the ancients what metals and fuels are to modern industry; it was the boast of a Roman emperor that he found the Eternal City brick and left it marble. Granite and sandstone and some limestone were quarried as well as rarer stones, such as alabaster and marble, which were used to make statues, cups, bowls, vases and other artistic objects. At their apexes the significant ancient civilizations showed a high degree of skill in stone working and construction, which found expression in palaces, pyramids, temples, statuary, tombs, fortresses, amphitheaters, aqueducts and roads. Since it was too costly to hew rock from its native beds with the crude hand tools then available, such as drills and saws made of copper and later of iron, it could be used only for major public works. The production process was slow and laborious and the structures represented the efforts over long periods of years of innumerable slaves and convicts, who labored under conditions of the utmost cruelty and degradation (*see MINING*). Hand methods and forced labor employed by the ancients were modified but slightly during the epoch of fortress and cathedral construction in the Middle Ages.

The importance and utilization of stone were greatly augmented by the economic and social changes wrought by the industrial revolution. Increasing urbanization required more stone for building and street paving and incidentally for public monuments. The growth of commerce made better highways imperative, and the macadamizing method of road construction created a great demand for broken stone. The increasing use of Portland cement after the 1880's required

large amounts of limestone, one of the essential raw materials of the new hydraulic cement. These two developments stimulated and improved crushed stone quarrying. Production costs were diminished, and the employment of stone became more general, through the mechanization of the industry. At the same time stone acquired new uses. Limestone is used not only because of its bulk, but also for its desirable chemical and physical properties, which make it an important raw material, particularly in cement and lime manufacture. Indeed in chemical industries lime is known as "king of all the bases." Crushed limestone is employed also in metallurgy as furnace flux, in sugar refining, in rubber, paper, glass, mineral wool and refractory manufacture and in many other ways, as in coal mine dusting and as fertilizer.

There is an abundant variety of stone in the United States. In the Appalachian district from Maine and Vermont to Georgia are crystalline marbles, slates, unaltered granite, sandstone and limestone; in the region between the Appalachians and the Rocky Mountains limestone and sandstone are the characteristic commercial stones, although isolated areas of granite occur; in the Rocky Mountain belt both igneous and metamorphic stones are abundant and accessible granites and marbles are of commercial importance; in the Pacific coast region are to be found granite, basalt, marbles, slates, unaltered limestones and sandstones and various forms of volcanic rocks. The exploitation of stone is undertaken wherever markets exist sufficiently close to desirable stone deposits. Favorable endowment of resources permits most communities to satisfy from relatively nearby sources local requirements for the ordinary rough uses of stone.

Early colonization in the United States took place in New England and the middle Atlantic states where rock was abundant, so that stone was the most widely used mineral in the first part of the nineteenth century. Many quarries supplied granite for houses and public buildings; in 1833 a number of structures in Boston, including the courthouse and several churches, were built of granite, which was also used in the Bunker Hill Monument. Several marble, sandstone and slate quarries were in operation in Vermont, Pennsylvania and Connecticut. The principal equipment of these early quarries consisted of crowbars, wedges, sledges, crude windlasses and horse drawn carts. By 1880 the annual value of stone, which consisted mainly of dimen-

sion products, was \$22,000,000. There was a fluctuating although gradually expanding use during the succeeding twenty years. After 1900 the development was more rapid; the value of output of limestone, granite, sandstone, basalt, slate and marble rose from \$75,092,000 in 1909 to \$101,685,000 in 1919. Virtually the entire increase was in limestone, which rose in value from \$29,832,000 to \$52,944,000.

The stone industry of the United States since the World War has been characterized by a slowly rising demand for dimension products and by a very rapidly growing demand for crushed stone. The use of crushed stone was confined almost exclusively to road building until 1898, when larger quantities began to be utilized for concrete aggregate and railroad ballast. Its phenomenal advance accompanied the spectacular rise of Portland cement, for which it supplied the principal constituent and with which it was used as aggregate. In 1886 the output of crushed and broken stone was smaller in volume than that of dimension stone, while in 1930 the tonnage of crushed stone was 30 times larger than that of dimension stone. In 1929 the sales of limestone exceeded the sales of any other stone, while sales of stone in crushed form exceeded the sales of any other form. Total sales of stone other than slate in 1930 amounted to \$178,948,611 (Table I); sales of slate amounted to \$7,911,618.

TABLE I

SALES OF STONE BY VARIETIES AND USES, UNITED STATES, 1930

VARIETIES		
Limestone		\$100,002,114
Granite		30,423,853
Basalt		17,053,031
Marble		12,908,596
Sandstone		10,285,391
Other		8,278,626
Total		178,948,611
USES		
Crushed stone		87,554,354
Building stone		30,111,527
Monumental		13,157,550
Industrial*		17,686,433
Agricultural†		3,309,329
Other		18,129,418

* Lime stone and marble, include furnace flux but not limestone used in the production of Portland cement, natural cement, lime, etc.

† Lime stone.

The failure of dimension stone to show substantial gains for building purposes is due both to the relatively high cost of stone and to the time saved by the speedier type of steel and

concrete construction. The loss of income from funds tied up in large building projects on valuable city real estate is often the determining factor against the use of stone in favor of materials and methods which promise earlier completion. In addition to the time element various dimension quarry products meet sharp competition from other industries; natural roofing slate competes with manufactured roofing materials, building stone with brick and soapstone toilet basins with colored ceramic basins. The dominance of crushed stone production is due largely to the numerous uses to which limestone is put (Table II).

TABLE II

OUTPUT OF CRUSHED LIMESTONE AND OTHER CRUSHED STONE, UNITED STATES, 1930

(In short tons)

CRUSHED LIMESTONE	
Concrete aggregate and railroad ballast	56,775,060
Portland cement, including "cement rock"	40,500,000
Fluxing stone	17,021,350
Lime	6,780,000
Alkali works	4,436,160
Riprap	2,018,110
Agriculture	2,542,100
Refractory stone (dolomite)	453,350
Asphalt filler	430,290
Sugar refineries	414,340
Calcium carbide works	304,750
Natural cement ("cement rock")	341,000
Paper mills	248,790
Glass factories	224,180
Road base	139,030
Whiting substitute	119,350
Magnesia works (dolomite)	111,740
Mineral (rock) wool	64,850
Stucco, terrazzo and artificial stone	59,570
Coal mine dusting	47,750
Poultry grit	45,920
Filter beds	30,860
Mineral food	30,350
Fertilizer filler	12,240
Carbonic acid works	2,290
Roofing gravel	1,740
Other uses	310,260
Total limestone	134,425,430

OTHER CRUSHED STONE	
Basalt and related rocks	16,045,091
Granite	6,980,334
Sandstone	2,770,908
Miscellaneous stone	7,594,704
Total other crushed stone	33,400,037

Grand total crushed stone 167,825,467

Dimension stone, including slate, and crushed stone operations constitute two sharply defined branches of the stone industry, differing in technology, types of products, management require-

ments, location and marketing processes. For quarrying dimension stone explosives are used very sparingly as the integrity of blocks must be maintained. Cuts are made with channeling machines or wire saws or rock masses are separated by wedging, whereas in quarrying crushed stone heavy charges of explosives are used. Similarly all subsequent steps in the preparation of the two products for market differ. The producer of dimension stone uses saws, planers, "carborundum" machines, rubbing beds and polishers; the producer of crushed stone employs churn drills, power shovels, crushers, screens, elevators and belt conveyors. Dimension stone is sold chiefly by the cubic foot, and much of it commands a price sufficiently high to give it a nation wide market. Crushed stone is sold by the ton and is so low priced that it will not bear heavy transportation expense. Raw materials for crushing are available in many places; quarries are numerous and are scattered throughout the country. The dimension stone industries are centralized in a much smaller number of localities. This is true particularly of marble and slate.

As stone suitable for crushing is obtainable in many places, it is practically impossible for an operator to monopolize available deposits. The producer is usually faced with competition from nearby quarries, from natural gravel and, in the vicinity of smelters, from crushed and granulated slag. Assuming reasonably favorable natural conditions with reference to depth of overburden and distance from markets, successful management eliminates competitors through corporate consolidations and by maintaining low prices through mechanized production and low cost transportation. Thus in the vicinity of large consuming centers ownership of plants shows a remarkable degree of concentrated control. In the United States in 1929, 7 of the 17 companies producing concrete aggregate, road metal and railroad ballast accounted for more than 15 percent of the national production; 84 companies produced more than 50 percent of the output; and 869, or 60 percent of all the companies, produced less than 7.5 percent of the country's total.

Because of the need for heavy machinery to facilitate mass production of a low value product about 85 percent of the investment of crushed stone companies is in plant and equipment, the remainder representing the value of the land and mineral. Markets are chiefly local in character and transportation is of vital importance. Haul-

age charges represent a large part of the delivered price and limit the potential marketing area. A survey made in 1926 indicated that crushed stone shipments by rail ranged from 20 to 300 miles, 80 miles being about the average; boat hauls were from 20 to 350 miles; and motor truck shipments were from 1 to 25 miles. With the extension of hard surfaced highways and the development of motor trucks capable of hauling heavy loads at speeds of 35 to 50 miles an hour, rail shipments declined from 57 percent of the total production in 1926 to 39 percent in 1931. The dropping off in rail transport is due to several other factors, such as increased use of local sources of supply in road work and the activity of small portable plants. These tendencies have increased the volumes handled by truck, and at the same time trucks have competed more effectively in transporting the product of the large centrally located plants.

The dimension stone industry in the United States is composed of a number of subdivisions, each practically an industry itself, organized around a specific product with individual problems, corporate structures and specialized marketing techniques. The most significant are the limestone industry, principally in Indiana, the granite industry, with important producing areas in Maine, Vermont, Massachusetts, North Carolina, Georgia, Minnesota, New Hampshire and Wisconsin; the marble industry, centered in Vermont, Georgia, Missouri and Tennessee; the sandstone industry of Ohio; the soapstone industry of Virginia; and the slate industry of Vermont, New York and Pennsylvania. Indiana oolitic limestone is by far the most used building stone; its annual production represents about 45 percent of all kinds of natural building stone and about 85 percent of all dimension limestone in the United States. Because of the ease and cheapness of quarrying and finishing it could compete with more favorably situated building stones and those previously more extensively used, and its light buff and gray colors provided relief and contrast from the somber browns and reds which had formerly been the vogue.

In the struggle to lower costs many forms of machines have been adapted to quarrying dimension stone, but the high degree of mechanization prevailing in crushed stone production is not possible in the more delicate art of hewing dimension blocks. Here the principal mechanical advances followed the change from steam to electricity and compressed air, which permitted the powering of hand tools requiring more or

less human direction in accord with the peculiarities of nature and the possibility of fracture. Manual exertion has been greatly reduced by the use of power shovels, drag line excavators and hydraulic methods for overburden removal and of the air drill, electric channeler, wire saw, electric or steam hoist and power haulage in the actual quarrying process. The trend toward the machine has been accelerated in recent years; the total rated horse power of power equipment at quarries almost doubled over the decade ending in 1929. There are tasks, however, in which the lever, sledge and wedge are still essential, as in the removal of key blocks, and considerable human labor is still required where the machine fails or is inadequate. In the milling and finishing plants, where rough standard sized blocks from the quarry undergo further preparation, powered diamond and gang saws, planers, lathes, cranes and polishing machines aid in the finishing; but carving is usually done by hand, sometimes with the aid of pneumatic tools. Finishing quadruples the value of the raw blocks.

With the exception of the wire saw, which was not widely used until 1928, mechanical equipment has not reduced the enormous waste incident to dimension stone production. Bowles has estimated that not more than 40 percent of the rock stripped and blocked out in the Indiana limestone quarries is recovered in usable form; in addition mill wastes amount to 15 to 20 percent of the gross footage entering the mill. In the sandstone industry the volume of finished products represents less than one half of the quarry output; in the slate industry, where wastes are particularly large, the salable material probably amounts to not more than 10 percent of the slate quarried. Every branch of the dimension stone industry is affected similarly. While some loss is unavoidable, the portion of the waste due to carelessness in the use of explosive and in the sizing of blocks is preventable.

Efforts to utilize quarry waste in the form of crushed stone have not been successful as a solution of the waste problem. Promising attempts to market the unusually pure and useful Indiana limestone waste as by-product stone fell far short of expectations, the material disposed of representing only a fraction of the thousands of carloads discarded. Insufficiently large nearby markets are the chief difficulty encountered in attempts to dispose of large quantities of by-product stone; dimension stone quarries are located without reference to large crushed stone outlets, and the tonnage of salable

waste is limited by the consuming capacity of areas adjacent to the quarries, since the low value of the material precludes long hauls.

Companies producing only standard sized quarry blocks and slabs are at a disadvantage in marketing; for while off-size blocks may be utilized with judicious management, they are not readily disposed of and can command only a low price. A second and larger group of companies, which includes most of the large producers, quarry and manufacture stone into finished products. The affiliated mills are located either at quarries or in nearby towns, the latter usually being preferred because the labor requirement is large and living conditions are more favorable. A third group of companies buy sawed or rough stock and manufacture products but do not operate quarries. In the Indiana limestone industry from two thirds to three fourths of building stone is normally sold as rough or sawed blocks and slabs to mills situated in large cities, where it is fabricated chiefly for small or moderate sized building contracts. The balance of the production is manufactured in the mills operated in connection with quarries. These mills, supplied with shop drawings, cut the stones to exact dimensions for distant construction projects. The smaller limestone quarries in various states sell much of their product directly to builders and contractors for local use.

The task of marketing dimension stone is primarily one of supplying a quality market with a raw material for special purposes. Desired building effects and other artistic considerations are determining factors rather than distance from source, as is illustrated by the broad distribution of Indiana limestone. Records of shipments in the United States since 1917 indicate that this stone is used in 43 states as well as in Canada, which consumes about 2 percent of the output.

In the past 40 years bankruptcies and receiverships have been common in the American stone industry and there has been a dominant trend toward consolidation and concentration. In 1886, 33 companies operated marble quarries in Vermont. At present only 4 companies are in existence, and one of them controls more than 90 percent of the state's output and about one third of the marble production of the country as a whole. One marble company, which in 1916 absorbed all competitors in the Georgia marble district, supplies roughly one fifth of the national total. In the granite district at Barre, Vermont,

8 or 9 companies operate and 1 company accounts for about 25 percent of the district's output. Considerably more than 50 percent of the production of dimension granite in North Carolina comes from plants of a single corporation. A quarrying company, formed in 1929 by a merger with other producers in Ohio, controls about 5 percent of the country's dimension sandstone output, and there is only one producer of dimension soapstone in the United States.

The most spectacular effort toward concentration in the stone industry was the combination of 20 quarrying and 6 independent milling companies (out of a total of 30 companies) as the Indiana Limestone Company in 1926. At the outset the consolidation controlled more than one half of the production of the Bedford-Bloomington district, an advantage which was not maintained, as output dropped to one third of the district total in the next five years. While the new company was not effective in checking the growth of competitors, as the outstanding producer its prices tended to set the tone for quotations by other operators. While there was always a tendency toward a single price scale for the district, this tendency was stronger after the formation of the Indiana Limestone Company. Beneficiaries of the changing production ratio were the independent quarrying and milling companies—some of them the outgrowths of earlier and smaller consolidations—who after the consolidation of 1926 organized the Building Stone Association of Indiana as an independent information and service bureau. In 1932 the Indiana Limestone Company was refinanced and reincorporated as the Indiana Limestone Corporation. In the first half of 1933 the new corporation and the independent companies joined in the formation of the Indiana Limestone Institute, the early efforts of which seem to have been directed toward sales promotion.

Trends toward corporate concentration in important producing districts have never attracted much public concern, as profits were not sufficiently spectacular to command attention. While operations in a single district might be consolidated, other producing areas and even different stones provided active competition. Moreover the relative abundance of stone resources limits the effectiveness of corporate consolidations as an instrument of control even in limited areas. Independent operations usually continue and often increase in size at the expense of the combination, as unworked deposits

are readily available either for purchase or for leasing on a royalty basis.

Royalties, although paid frequently, are not very important economic considerations in either the dimension or the crushed stone industries. They are commonly charged as a fixed sum per ton or cubic foot of material sold and vary considerably with the size of operation, value of products and other factors. Royalties range from 10 percent of the net selling price of slate to 4 to 10 cents a cubic foot on Indiana limestone sold as cut stone for \$2 to \$3 or from 2 to 5 cents if the limestone is sold as rough building stone. Royalties for crushed stone vary from 1 to 10 cents a ton depending on local conditions. Where exploitation is undertaken on the public domain, prevailing leasing provisions prescribe a minimum royalty of 5 percent of the net value of the output. Most private owners require a minimum average July or monthly production as a condition of the royalty agreement.

About 100,000 workers are employed in the quarrying and finishing of stone products. For the quarrying of dimension stone the largest single cost is the wage bill, which amounts to one third of the value of the raw products. The proportion of wages to value is much lower in crushed stone production because of the higher degree of mechanization. In the manufacture of marble, granite, slate and other stone products in 1929, 37,805 wage earners were employed, receiving total wages of \$63,057,000, or an average of \$1669; this comparatively high wage is indicative of the great amount of skilled labor employed. Such figures as are available on employment show that quarry employees work an average from 48 to 60 hours per week, with considerable variations in length of the working day among individual plants. Adverse weather conditions in winter and seasonal demand effect sharp reductions in working time. While somewhat less than a third of the quarries operate on virtually a full time basis, the remainder work much less steadily. Operations producing the porous dimension stones, such as sandstone and Indiana limestone, are normally idle from three to four months during freezing weather, as frost has a deleterious effect on unseasoned stone. Naturally a larger potential working time prevails for southern quarries as compared with those in colder areas. Data as to accidents to quarry workers indicate that the hazards are about double those in the stone finishing trades although fewer than in metal mining (see MINING ACCIDENTS).

The quarrying branch of the stone industry is characterized by almost complete lack of trade union organization, and wages are usually at the scale prevalent for common labor in the locality of the quarry. This is generally true of the entire crushed stone industry and of most dimension stone quarries, with the exception of certain parts of New England. In the Barre district of Vermont and in certain parts of Maine and Massachusetts the Quarry Workers' International Union of North America, with a reported total membership of 4000, has enrolled quarry workers and has become an active factor in collective bargaining. Local affiliates of this organization are reported in many other districts.

The important and strategic task of milling, cutting and finishing dimension stone is handled almost entirely by union labor. There are four unions, all affiliated with the American Federation of Labor, active in this branch of the industry: the Journeymen Stone Cutters' Association of North America; the Granite Cutters' International Association of America; the International Association of Marble, Stone and Slate Polishers, Rubbers, and Sawyers; Tile and Marble Setters' Helpers, and Terrazzo Workers' Helpers; and the International Paving Cutters' Union of the United States of America and Canada. These organizations are firmly entrenched, and with only a few exceptions their members handle the milling and finishing of stone at quarries and nearby milling plants and at the finishing plants located in almost every large city. The importance of the latter is apparent when it is recalled that about two thirds of the Indiana limestone leaves the producing district as rough block and is finished at its destination. In certain instances some of the finishing trades, possibly with the assistance of other factors, apparently enforce conditions to the interest of certain local unions which affect the marketing of stone. There seems to exist, for example, an understanding that only rough stone is to be shipped into the New York City district for finishing within the metropolitan area at such plants as those located in the vicinity of Long Island City.

In general aspects the quarrying industries are practically the same in all the highly industrialized nations. Quarrying is usually carried on for small local markets in economically backward countries; primitive methods of production prevail, although mechanization makes steady progress. Some of these countries have a fairly large production; thus British India in 1929

produced 4,760,000 tons of stone, mainly granite and limestone. Some colonial countries produce small amounts of stone for export; of 198,000 tons of limestone produced in the Congo, only a small proportion was used locally. Nearly every country produces several varieties of the more important stones. In 1929 the United Kingdom produced 14,614,000 tons of limestone, 3,100,000 tons of sandstone and 305,000 tons of slate; France had a total stone production of 39,500,000 tons, of which limestone represented 16,000,000 tons; Germany had a considerable production of basalt, granite, limestone and sandstone; Italy produced over 15,000,000 tons, including limestone, marble, sandstone and lava stone. Every nation has adapted locally available stones to its peculiar needs. Limestones, sandstones and granites are the chief varieties in general use, while Italian and African marbles serve special purposes.

The foreign stone trade of the United States is not significant: exports seldom exceed \$3,000,000 in value, and during the five-year period 1927-31 imports about equaled outgoing shipments. Exports of stone, sand, lime and cement averaged \$5,537,000 in 1921-25, rising to \$6,819,000 in 1929; imports averaged \$5,906,000 in 1921-25, rose to \$10,708,000 in 1928 and declined to \$7,377,000 in 1929. International trade in stone is confined to requirements for particular varieties or highly desired types and to the short distance movement of crushed stone to nearby destinations across international boundaries.

QUATREFAGES DE BRÉAU, JEAN-LOUIS ARMAND DE (1810-92), French physical anthropologist. Quatrefages was professor of natural history at the Collège Henri Quatre from 1850 to 1855 and professor of anatomy and ethnology at the Museum of Natural History in Paris from 1855 to 1892. After obtaining doctorates in mathematics, in medicine and in natural sciences, Quatrefages enlarged his studies under Milne-Edwards. His study of man as an individual became an investigation of man as a species. His medical training in the processes of growth and repair favored a freshness of interpretation of morphology apparent in his *Métamorphoses de l'homme et des animaux* (Paris 1862; tr. by Isabella Innes, London 1872). Although its underlying hypothesis, geneagenesis, or the production of several generations through the medium of a single germ, has been invalidated, it led Quatrefages to examine critically the zoological theories then current. His most mature work is *L'espèce humaine* (Paris 1877; English translation, New York 1879). Here he defends the hypothesis of the unity of the human species and discusses human migrations, race crossing, acclimatization, fossil races, together with the physical and psychological characters of contemporary human races so far as these were known at that date.

Quatrefages' enthusiasm for original observation and for constant revision of accepted doctrines led him to champion Boucher de

Perthes, to take a prominent part in the great controversy over white and colored races in the Société d'Anthropologie de Paris and to participate in the founding and maintenance of learned societies, such as the Société de Géographie de Paris. He was an able critic who held closely to facts, invariably generous to his scientific adversaries and never belittled their contributions. He deplored the political use of anthropological observations as a dangerous practise which is almost always conducive to error. The secret of his influence lay in his scientific honesty and generosity.

QUENTAL, ANTHERO TARQUINIO DE (1842-91), Portuguese poet and philosopher. Quental was born in the Azores of a noble family with traditionalist views and studied law at the University of Coimbra. Possessing adequate means, he spent much of his time in travel. He never held public office, nor did he engage in private business enterprises. Philosophic meditation, poetic idealization and socialist propaganda among the working classes were his favorite occupations. Possessed of an incomparable facility for self-expression and powerful personal magnetism, he exerted a great poetic, philosophic and politico-social influence. As a poet he was the leading spirit in the revolt against the romantic school in Portugal. He did not consider poetry an end in itself, being more concerned with its use as a medium for attacking difficult moral and social problems. Quental is a representative of the late nineteenth century pessimism which followed the so-called "bankruptcy of science," and his *Hymno da manhã* (Hymn of the morning) is the finest poetic expression of that pessimism. His philosophic influence was directed against the positivist approach introduced into Portugal by Theophilo Braga. Quental took up and in turn rejected various creeds and systems—Catholicism, materialism, Buddhism, Hegelianism—and finally formulated a philosophy of his own which he called "optimistic psychism."

His politico-social influence, which he compared to that of a "minor Lassalle," was spread through journalism, lectures and organizing activity. He was one of the first to introduce the

ideas of Proudhon and Marx into Portugal, and his work forms part of the spiritual background of the revolution of 1810 which abolished the monarchy.

QUESNAY, FRANÇOIS (1694-1774), French physiocrat. Quesnay, a doctor of medicine by profession, had become physician to Pompadour and subsequently court physician when he began to publish the first elements of the economic and social system which from 1707 was known as physiocracy (for a detailed analysis, see Economics, section on Physiocrats). His first important disciple, Mirabeau the elder, was converted in 1757; in the course of the next decade he also gained the adherence of Dupont de Nemours, Mercier de la Rivière, Le Trosne, Saint-Péravy, Baudeau, Roubaud and other less well known figures. Under Quesnay's leadership this group became welded into a closely knit sect or school, maintaining close contacts with the disciples of Gournay and supported by several of the provincial agricultural societies and *parlements* as well as by certain governmental officials. Although all the characteristic doctrines of physiocracy were inspired by Quesnay, his subordinate if not equivocal position at court made him a discreet influence rather than a recognized authority outside his own group. The extreme compactness of his scattered writings also helped to restrict his fame.

Quesnay's rural background sheds light on the central position accorded agriculture in physiocratic doctrine. A man of exceptional strength of character, he retained even at court the mannerisms and interests inherited from his early life on a small farm. His first economic writings, two articles published in the *Encyclopédie*, were entitled "Farmers" (vol. vi, 1756) and "Grains" (vol. vii, 1757). In insisting upon the unique capacity of agriculture, when pursued under favorable conditions, to yield a *produit net* he referred to large scale enterprise backed by abundant capital such as he had observed during his youth in the rich canton of Île-de-France.

Quesnay's ideas are presented most comprehensively in his *Tableau économique* (Versailles 1758; reprinted by H. Higgs, London 1894), which has long baffled commentators, and the *Philosophie rurale* (Amsterdam 1763), written by Mirabeau in collaboration with Quesnay, which became the "Pentateuch of the sect." The former work, like the article "Impôts" (written in 1757) and *Théorie de l'impôt* (Paris 1760), also a joint product of Quesnay and Mirabeau, was a direct response to the financial crisis of the French government. It was Quesnay's contention that public finance could be restored only through a revival of agriculture, which would thus be enabled to support property taxes high enough to cover the major portion, if not all, of the government's expenses. He was here setting himself not only against industrial and commercial mercantilism but against the multiplicity of taxes and loans: the latter system, he insisted, benefited only pecuniary fortunes, which "know neither king nor country." His condemnation of the populationist theory of national wealth was expounded in his article "Hommes" (written in 1757).

In his general outlook Quesnay was essentially a simple surgeon, constrained by the practise of an art still held in slight esteem to observe nature with deference. The faith in the healing power of nature, which is a recurrent theme in his *Essai physique sur l'économie animale* (Paris 1736; 2nd ed., 3 vols., 1747), he transferred with the aid of the philosophy of Malebranche to the social sphere, and in "Droit naturel" (published in *Journal de l'agriculture* . . . , 1765) he postulated the existence of a natural order spontaneously able to harmonize individual interests, provided they were allowed free rein. It was for this reason as well as for the maintenance of the "good price" that he demanded economic freedom. As a political theorist he also depended upon the free play of natural laws to limit the sphere of the monarch. Yet despite his intractable temperament Quesnay was a proponent of "legal despotism." The essential elements of the latter doctrine, including the exaltation of public opinion and the notion of the coownership of land on the part of the sovereign, were first formulated in Quesnay's "Despotisme de la Chine" (in *Ephémérides du citoyen*, 1767) and developed by Mercier de la Rivière in collaboration with Quesnay in *L'ordre naturel et essentiel des sociétés politiques* (London 1767).

G. WEULERSSE

Works: "Hommes" and "Impôts" are available in

Revue d'histoire des doctrines économiques et sociales, vol. 1 (1908) 3: 88, 137-86. The most complete collection is *Oeuvres économiques et philosophiques de F. Quesnay*, ed. by Auguste Oncken (Frankfort 1888).

Consult: Schelle, Gustave, *Le docteur Quesnay* (Paris 1907); Weulersse, C., *Le mouvement physiocratique en France de 1750 à 1770*, 2 vols. (Paris 1910), and *Les physiocrates* (Paris 1913); Higgs, H., *The Physiocrats* (London 1897); Gide, Charles, and Lévy, Charles, *Histoire des doctrines économiques depuis les physiocrates jusqu'à nos jours* (5th ed. Paris 1926) bk. 1, ch. 1; Ser, Henri, *L'évolution de la pensée politique en France au XVIII^e siècle* (Paris 1927) pt. IV, ch. 1; Guntzberg, B., *Die Gesellschafts- und Staatslehre der Physiokraten, Staats- und volkrechtliche Abhandlungen*, vol. VI, pt. III (Leipzig 1907); Hasbach, Wilhelm, *Die allgemeinen philosophischen Grundlagen der von François Quesnay und Adam Smith begründeten politischen Ökonomie*, Staats- und sozialwissenschaftliche Forschungen, vol. XIV (Leipzig 1909).

QUETELET, ADOLPHE (1796-1874), Belgian astronomer and statistician. Quetelet was the son of a minor municipal official in Ghent. He was appointed professor of mathematics at the Brussels Athenaeum in 1820 and later went to Paris to study the methods of practical astronomy. There he received instruction from Laplace in the theory of probability. On his return to Belgium Quetelet, although continuing his career in astronomy, became gradually more and more interested in statistical problems and the field which they offered for the application of the theory of probability. In 1829, upon the formation of the statistical bureau of Holland, Quetelet became correspondent for Brabant and assisted in formulating plans for the census of 1829. After the revolution of 1830 he became the supervisor of statistics in the Belgian administration and in 1841 he was instrumental in the organization of the Commission Centrale de Statistique, of which he was president until his death. Quetelet's influence on statistics came first of all from his practical work on census taking, the practical rules developed by him still forming the basis of modern census work. In addition he was largely responsible for the extension of statistical study from such physical facts as population, economic resources and the like to the wide field of "moral statistics," which includes the whole realm of acts determined by moral or psychological factors. He was extremely active in promoting international co-operation with respect to uniformity and comparability of statistical data, and it was through his leadership that the first International Statistical Congress was convoked in Brussels in 1853. In the field of theory Quetelet is known

above all for his conception of the *homme moyen*, or average man, a conception which in its positive contribution represents the application of the Gaussian normal law of error to the analysis of distributions of data on human characteristics. As a pioneering conception, however, Quetelet's doctrine was inevitably couched in metaphysical terms—as a theory of social determinism through an hypostatized abstraction. It thus laid itself open to valid criticism by statisticians and philosophers.

Quetelet was led to his theory of the average man by his observations on the distribution of human statures. The curve representing this distribution was in fact none other than that given by the theory of probability for the distribution of accidental errors. From this he concluded that the average man may be considered as the basic type, and the differences between this type and the various individuals as so many accidental errors made in the multiple reproduction of the type. He believed that there actually existed in nature fixed types which are preserved despite differences in climate, environment, habits and institutions, and applied the title of social physics to the science which should determine these types. Extending this sort of explanation to man as a moral and intellectual being, he declared that everything which concerns the human species considered en masse is of the nature of physical facts. The greater the number of individuals, the more the free will of the individual effaces itself in favor of "the series of general facts which proceed from general causes as a result of which society exists and is preserved." Thus not only the average length of life and the sex ratio at birth but also the annual number and age distribution of marriages and the proportion of suicides and crimes appeared to him to result from laws as rigorous as those in the physical sciences. Despite the criticism which the theory of the average man provoked it none the less exercised a great influence and helped to spread the conviction that there exists a determinism in social phenomena.

MAURICE HALBWACHS

Important works: *Sur l'homme*, 2 vols. (Paris 1835), tr. by R. Knox (Edinburgh 1842); *Physique sociale, ou Essai sur le développement des facultés de l'homme*, 2 vols. (Brussels 1869), comprising a new edition of *Sur l'homme* with much new material.

Consult: Mailly, Édouard, "Essai sur la vie et les ouvrages de . . . Quetelet" in *Académie Royal des Sciences, des Lettres et des Beaux-Arts de Belgique, Annuaire*, vol. XL (1875) 109-207; Hinkins, Frank H.,

Adolphe Quetelet as Statistician, Columbia University, Studies in History, Economics and Public Law, no. 84 (New York 1968); Lotin, Joseph, *Quetelet statisticien et sociologue* (Louvain 1912); Hallwachs, Maurice, *La théorie de l'homme moyen. Essai sur Quetelet et la statistique morale* (Paris 1913); Knapp, G. F., "Bericht über die Schriften Quetelet's zur Socialstatistik und Anthropologie," and "A. Quetelet als Theoretiker" in *Jahrbuch für Nationalökonomie und Statistik*, vol. xvii (1871) 160-74, 342-58, 427-45, and vol. xviii (1872) 89-124, with bibliography of Quetelet's numerous minor writings.

QUINET, EDGAR (1803-75), French historian and man of letters. The devotion of a Protestant mother, a stay in Heidelberg, a German marriage and the friendship of Michelet helped to make the imaginative, conscientious, verbally facile young Quinet into one of the most ardent and uncritical defenders of the resounding generalities—liberty, democracy, progress, God—which were common coin of the western world in the nineteenth century. Quinet wrote and lectured on many subjects. With Michelet and Mickiewicz he turned the Collège de France of the 1840's into a center of republican agitation, or rather into a temple of republican worship, for the proceedings were on almost too sublime a plane for true propaganda. Quinet's works are all sermons and all reflect the belief that ideas, and especially religious ideas, create society. Thus the diversity of the Hindu pantheon produced a caste society and the oneness of Jehovah was reflected in the unity of Hebrew social organization. Quinet's major emotional attachments were to the Protestant church (which he did not formally join), democracy, freedom of conscience and of expression and humanitarianism. For the Catholic church he had a ceaseless hatred, and his ablest polemics are those against the Jesuits. His intellect could never quite reconcile his various loyalties, and this difficulty is clear in his work on the French Revolution, the only one to survive. He was a democrat, a well-known party leader, a sentimental lover of the under dog and thus bound to enlist himself on the side of the great revolution; yet, impelled partly by doubts as to the love of liberty felt by a democracy which had established Napoleon III by plebiscite, he wrote a history of the French Revolution more bitterly hostile to the government of the Terror than many a royalist history. His grand conclusion was that the French Revolution failed because it was not a religious revolution, because France did not become a Protestant nation. The body of Quinet's work seems far removed from the

social and economic problems which France of his day was really facing, seems heavily overbalanced with emotion and suggests that the cultural implications of "Victorian" may profitably be extended outside England.

CRANE BRINTON

Works: *Oeuvres complètes*, 30 vols. (Paris 1857-95).

Consult: Quinet, Hermione, *Edgar Quinet depuis l'exil* (Paris 1889); Faguet, E., *Politiques et moralistes du dix-neuvième siècle*, 3 vols. (Paris 1891-99) vol. ii, p. 175-227; Saintsbury, G., *Miscellaneous Essays* (London 1892) p. 274-99; Seillière, E., *Edgar Quinet et le mysticisme démocratique* (Paris 1919); Steeg, T., *Edgar Quinet* (Paris 1902).

RABANUS MAURUS, MAGNENTIUS (older forms: Hrabanus, Rhabanus) (c. 776-856), German churchman, teacher and author. Rabanus Maurus, teacher and abbot of Fulda and later archbishop of Mainz, his native city, was easily the most learned man of the ninth century, far surpassing in erudition and wisdom his better known master Alcuin. His numerous writings, which reveal a profound knowledge of ancient and patristic authors, surveyed the whole field of sacred and profane knowledge. Designed to inform laity and clergy alike, they were mostly didactic in character. To characterize them as chiefly compilations is merely to repeat what the author admitted. He was convinced that it was his duty to make his vast knowledge available to all in the form of compendium and commentary. Rabanus was the first great teacher and founder of schools in Germany and seems to have deserved the appellation *primus praeceptor Germaniae*. While in charge of the abbey school at Fulda, from 803 to 822, he infused a more liberal spirit into the study of the arts and sciences. The restrictions placed upon grammar, rhetoric and dialectic by Boethius, Gregory the Great and Alcuin gave way before his humanistic viewpoint and his clear perception of the utility of these disciplines in the pursuit even of divine knowledge. After the example of Alcuin in France, he did much to introduce the ancient learning into Germany. Most of his active life was devoted to the task of raising the intellectual and cultural level of the German people. His glossaries of German words, together with his sermons preached in the vernacular, constituted the first important contributions to the enlargement and refinement of the German language. In order to revive the study of the Bible he introduced into Germany instruction in Greek. His Biblical commentaries, compiled from earlier writers as aids for his students and the clergy

generally, represent a valuable chapter in the history of Scriptural exegesis. Later and more original commentators owe much to his voluminous and searching compilations. Perhaps his best known work is the *De clericorum institutione*, a complete manual based on the best authorities of the past, for the education and training of the clergy; this work was widely used for several centuries. The whole range of his wide reading and study is summed up in the most comprehensive encyclopaedia of the Middle Ages, the *De universo*, a somewhat larger treatise than the great synthesis of Isidore of Seville, after which it was patterned.

ROBERT FRANCIS SEYBOLT

Works. Rabanus' works are reprinted in *Patrologiae latinae*, ed. by J. P. Migne, vols. cxi-cxii (Paris 1804-78).

Consult: Dahl, J. C., *Leben und Schriften des Erzbischofs Rabanus Maurus von Mainz* (Fulda 1828); Spengler, T., *Leben des heiligen Rhabanus Maurus, Erzbischofs von Mainz* (Regensburg 1856); Tarnan, Dietrich, *Rabanus Maurus, der Praeceptor Germaniae* (Munich 1900); Bach, J. N., *Rhabanus Maurus, der Schöpfer des deutschen Schulwesens* (Fulda 1835).

RABELAIS, FRANÇOIS (c. 1495-c. 1553). French romancer, physician and thinker. After abandoning the monastic life Rabelais, a native of Touraine, passed into the service and under the influence of the liberal minded du Bellays. Although he was concerned primarily with scientific knowledge rather than with language and philosophy, the great French realist speaks gratefully of his debt to Budé and Erasmus. As a link between mediaeval and modern literature his importance cannot be exaggerated. In addition to his enormous influence on French humorists from Molière to Anatole France as well as on foreign humorous literatures, he played an outstanding part in the general diffusion of the critical spirit which distinguishes the France of the seventeenth century from that of the sixteenth.

In the religious disputes he anticipated the *politiques* by adopting a middle course. Parting with Calvin on the question of man's innate corruption, he always claimed to be sincerely Catholic despite the Protestant tone of *Gargantua*. Yet he stoutly demanded church reform from within and attacked the idleness, ignorance and bigotry of the church and the Sorbonne with the same vigor that he manifested in excoriating contemporary superstitions, particularly divination by witches, Vergilian lots, dice and—in this respect almost unique in his generation—as-

trology. In educational theory he insisted that education be viewed as a preparation for life, stoutly advocated the necessity of instruction in the natural sciences and in particular was the first to insist on physical training. In political and social matters he at first expounded the Platonic conception of kingship, demanding of the ruler not only virtue and enlightenment but also familiarity with the practical needs of his land. Later he became more conservative but repeatedly deplored all wars and denounced such evils as the covetousness common to all classes, in which he saw a major cause for the corruption of law, marriage and other institutions. In the character of Bridoie he castigated legal incompetence; in the Chats fourrés ambition; in Enticchie social uselessness. On the positive side he emphasized the vital interdependence of rich and poor and insisted that privilege, "taking and receiving," should be supplanted as the guiding, social principle by service, "imparting and giving." Finally, the old utopian dreamer of *Gargantua* and *Thelème* prophesied the rise of a new spirit of inquiry, inspiring the resolute exploration of truth, both absolute and scientific, and the building up of a body of real knowledge, which would condition the conduct of human affairs and exalt mankind to unimagined power.

A. F. CHAPPEL

Works. *Gargantua and Pantagruel* are included in the best modern edition, *Oeuvres*, ed. by Abel Lefranc and others, vols. I-V (Paris 1912-31). For detailed information concerning editions see Boulenger, Jacques, *Rabelais à travers les âges; compilation suivie d'une bibliographie sommaire* (Paris 1925).

Consult: Tillex, Arthur, *François Rabelais* (London 1907); Nock, A. J., and Wilson, C. R., *François Rabelais* (New York 1929); Plattard, Jean, *La vie de François Rabelais* (Paris 1928), tr. by L. P. Roche (London 1930); Chappell, A. F., *The Enigma of Rabelais* (Cambridge, Eng. 1924); Gebhart, Emile, *Rabelais, la renaissance et la réforme* (Paris 1877); Gmelin, Hermann, "Rabelais und die Natur" in *Archiv für Kulturgeschichte*, vol. xxiv (1933) 71-89; Compayré, G., *Histoire de la pédagogie* (Paris 1884), tr. by W. H. Payne (Boston 1885) ch. v. See also articles in *Revue des études rabelaisiennes*, published quarterly in Paris from 1903-12 and continued as *Revue du seizième siècle*, 1913-31.

RACE. The term race is often used loosely to indicate groups of men differing in appearance, language or culture. As here understood it applies solely to the biological grouping of human types. On account of the lack of sharp lines of demarcation the attempts at classification, based on varying characteristics, have not

led to a generally accepted system. Early attempts at a systematic arrangement of human races were made in the eighteenth century. Linnæus included under the general order of primates the genus *homo sapiens*, which he divided into six subgroups, *homo ferus*, *americanus*, *europæus*, *asiaticus*, *afæ*, *monstruosus*. The first and last of these groups may be disregarded, the first as non-existent, the last as pathological. The others are representative of the human types inhabiting the four large continents, described according to outstanding traits of a number of extreme forms. This procedure, on which the whole Linnæan classification is based, was in his case unavoidable because of the lack of detailed knowledge of the distribution of human types. It is interesting to note that in the description of each race mental traits are included as biological characteristics. Buffon considered the human races as varieties derived from an original white form and developed under the influence of climate. Blumenbach distinguished five races of man—Caucasian (European), Mongolian, Ethiopian, American and Malayan. His divisions are based on distinction of color, hair and descriptive features of skull and face. Later, form of hair, color, form of nose and shape of skull became the primary criteria by which races of man were distinguished. The number of races so obtained varies from three or four to thirty-four. Huxley distinguished five races—Australoid, Negroid, xanthochroic, Mongoloid, melanochoic. Denker established seventeen groups subdivided into twenty-nine races. By a similar method Duckworth derived seven principal races. The types of Europe have been described in particular detail. Ripley's division in the blue-eyed, tall Nordic; the darker, short-headed Alpine; and the short, long-headed Mediterranean is still much used; although later attempts at finer divisions have been used by Denker, Hans Gunther and many others.

In more recent times attempts have been made to place races in definite order, either phylogenetically, by trying to show that one type gave rise by diversification to a new type; or by investigating whether some types have retained in their adult forms earlier stages of individual development. Fritsch distinguished three fundamental races and derived from these metamorph, or mixed, races. Stratz distinguished protomorph, archimorph and metamorph races. The protomorph races, that is, those remaining on a very primitive level with specializations in which the large archimorph races do not par-

ticipate, are determined not anatomically, but by the isolation of the inhabited area in which ancient animal forms occur and by the low cultural level of the people. The intermingling of biological and cultural viewpoints vitiates this classification. Klaatsch also is interested in the establishment of a phylogenetic order of existing and prehistoric races. The most recent attempt at a detailed phylogenetic classification is that of von Eickstedt.

These attempts at classification are based on purely anatomical characteristics, except in so far as mental traits are sometimes brought in as secondary features. Friedrich Müller, on the other hand, classified races first of all by form of hair, then by language. The intermingling of anatomical and linguistic traits cannot result in an understanding of the biological relation of races.

Equally remote from biological interpretation of racial forms are the attempts at classification based on cultural conditions, from which certain kinds of racial mentality are derived. On a purely deductive basis Carus posited the existence of four races, those of day, night, eastern dawn and western dawn; that is, Europeans, Africans, Mongoloids and Americans. Klemm divided mankind into an active (male) and a passive (female) group, the latter containing all human forms except the Europeans and west Asiatics. His anatomical characterization of the two groups is altogether inadequate. In recent times the belief in a close interrelation between mental behavior and bodily build has come to be a matter of great social importance. Positive evidence for such relation has never been given.

The similarity of form of closely allied races early led anthropologists to introduce quantitative values in place of vague verbal descriptions. Thus Daubenton and Camper introduced measurements of angles. Later linear measurements, particularly of the skull, came into general use and in 1842 Retzius utilized as a distinguishing criterion the so-called cranial index—the relation of breadth of head expressed in percentage of the length. This procedure, which gives not only the absolute dimensions of body parts but also some indication of form, has been applied to numerous other ratios on the skull as well as on the skeleton and has since become a dominant feature of anthropological research. The method is being applied not only to skeletal material but also to the living, and anthropometric descriptions of types have become the rule.

The length-breadth index has a great taxo-

nomie value in distinguishing local varieties of man; it can be determined with great accuracy on the living, and the values obtained on the living and on skeletal material are nearly identical. For this reason this index has gained particular currency as an identifying mark of racial types. It gives a numerical value for striking differences in the appearance of head or skull as seen from above.

Since the numerical values, including the indices, range almost continuously from certain minimum to maximum values in individuals of each local type, it has been found convenient to form three groups—one including the lowest values, another the middle values, the last the highest values—and to classify individuals accordingly. For the cephalic index particularly a division has been made into dolichocephalic (long headed), mesocephalic or mesatecephalic (middle headed) and brachycephalic (short headed) individuals or groups. The demarcation of such groups is necessarily arbitrary. Nevertheless, anthropological classification has long been dominated by the concepts of dolichocephalic, mesocephalic and brachycephalic races and the types have been defined further by other measures and indices; such, for example, are those determining the height of the head (the distance of the vertex from a line drawn from ear to ear or the distance from vertex to base of skull) and its relation to the length of the head, or measures and indices of the face, such as the distance from the root of the nose to the chin in its relation to the greatest transversal diameter of the face; or those of the body, like that of the length of limbs in relation to length of trunk.

These numerical values give an inadequate impression of form, because in every case only two measures are used to identify a complex form. Heads or skulls with the same cephalic index or the same height index may differ materially in form. This inadequacy of the purely metrical method was felt by investigators thoroughly trained in anatomy, and in recent times there have been an increasing number of attempts to base the characterization of races on morphological traits. Sergi classified skull form according to general form rather than according to index values. Many special investigations of skeletal forms, teeth, hair, soft parts of the body and blood are based on these principles.

On account of the lack of information regarding the degree of hereditary fixity of the traits dealt with, classifications based on them have no genetic value. This is true of the elaborate

classification of races by Deniker, in which stature and cephalic nasal and facial index are prominent features. It is not known to what extent any of these traits can be considered as stable or subject to fluctuations caused by outer conditions which, in conjunction with genetic determinants, result in observed forms. If these fluctuations are considerable and conditions change, they may modify more or less fundamentally the taxonomic classification.

Races have been considered as well defined units. Actually the picture of the race has been constructed as that of an individual who possesses all the most pronounced traits of the group considered or, in the case of metrical values, who shows the most frequent value, which is assumed to be the average value of the measures. It has been recognized more and more clearly that this view involves an inadequate simplification of the actual conditions. Ever since Quetelet it has been understood that the type represented by the average value of descriptive or metric values is a fiction and that in every case race must be described by a statement of the distribution of the multiplicity of forms occurring within it. A statistical method of description is therefore required and is receiving increasing attention.

It has become customary to assume that individuals representing a race are distributed approximately according to the law of chance (the exponential law) or some other law closely related to it, and to describe the measurements occurring in a type by their average and their standard variability; that is, the average of the square of all individual deviations from the average. Races differ not only when their averages differ but also when their variabilities differ. On this basis there have been drawn geographical distributions of average values and of variabilities of local types, which demonstrate the gradual transitions between local types. Maps also have been prepared, showing the frequency of certain selected forms, like the distribution of tall or short, long headed or round headed sections of a population. These are of doubtful value, since the limits of these classes are arbitrary and the erroneous impression is conveyed that they represent distinctive racial types.

The study of averages and variabilities has proved that human populations inhabiting adjoining territories overlap in regard to most features, so that it is not possible to assign with certainty any one individual to a definite group.

It is only when races of widely separated areas are compared that there is no overlapping. Criteria of fundamental races are valid only when they are common to all individuals of the race and are not found in other races. Thus the dark pigmentation, the frizzly hair, the broad nose of the true Negro are racial characteristics as contrasted with the slight pigmentation, blond, wavy hair and narrower nose of the north European. Keith calls such races pan-diacritic. There are no races of man in which no overlapping occurs in regard to all the traits examined. Negroes and Europeans may be tall or short, round headed or long headed, large or small brained. The averages and variabilities of these traits may differ, but the distributions are such that many if not most values are common to both races. Nevertheless, human types which are fundamentally distinct in regard to any one hereditary trait must be considered in this respect as distinctive genetic lines and the origin of their peculiarity as well as what they have in common with other groups deserves special attention.

It follows from these observations that stature and cephalic index can be considered as fundamental racial criteria in exceptional cases only, notwithstanding their value as characterizing local varieties. Since they occur in almost all races with the same values, they must be regarded as late developments. The dwarfish stature of the Bushmen and of other pygmy tribes is an instance in which stature becomes a discriminatory character.

Exact descriptions of human types are based on the observation or measurement of many traits. On the whole the interdependence (correlation) between traits is not very great. Thus the individuals who conform to the combination of the most frequent traits are actually very few. In a population consisting of varying individuals all those who deviate too much from the middle group are liable to be excluded as atypical and the "pure" type may perhaps be defined as including only individuals of the middle group. Then only one half of the population would have one typical trait, one fourth would have two typical traits and only one in 1024 would have ten typical traits, provided the selected traits are unrelated. The type, therefore, has no reality but is derived subjectively from the impression of the observed forms. When the variability of the group is very small, the individual differences permit the grouping of many more than one half of the series as true to type which will then come much nearer to reality. There

are, however, few populations whose variability is so low that the type is ever realized. For this reason the selection of typical individuals must always be ascribed largely to a subjective, selective process.

The problem of race must, however, be attacked not only as a taxonomic question but also from the point of view of the genesis of racial form. The hereditary, environmental (peristatic) and selective influences which determine racial forms must be considered. Hereditary traits in man have been studied not so much from the racial point of view as from that of hereditary traits in given families. Besides eye color and a few other traits pathological phenomena have received particular attention. The relative importance of environment and heredity has been analyzed by means of investigations of identical twins. The value of these investigations of heredity in individual lines must not be underrated, but the results should not be ascribed directly to the hereditary behavior of races. These may be homogeneous and heterogeneous in two ways. A group descended from a small group of ancestors of the same hereditary form will be uniform throughout, as, for example, the Eskimo of north Greenland, who represent remarkably uniform measurements. In these cases both the averages of the family lines and the members of a fraternity will be alike. In the case of descendants of ancestors of distinct form who have been inbred for many generations the averages of the family lines will also be uniform, but ordinarily the members of each fraternity will differ considerably among themselves, because in regard to certain traits they will revert to the ancestral forms. The family lines will be uniform and each a good representative of the whole population, while individuals may differ greatly. The population is homogeneous as to family lines, heterogeneous as to descent. Finally, there are populations in which the family lines are very distinct and in which the fraternities may be uniform or heterogeneous, according to the descent of the family line. These differences are obscured in the usual descriptions of the variability of populations, which actually consists of two parts, the variability of family lines and also of fraternities; these must be separated. Even in the most rigidly inbred communities considerable differences in family lines have been found, differences which are much larger than those between neighboring groups each taken as a whole. Heredity exists solely in the distinct family lines,

not in the racial group, and the genetic analysis must be founded on a study of the behavior of the component family lines.

If the family lines were identical and derived from a single morphological source, selective mating could have no influence upon the racial type; if the origin of such a population is diverse and there is a tendency to preferential mating between certain forms, the family lines may become distinct. If the family lines are diverse and there is no preferential mating, they will become more uniform during a period of continued inbreeding. If there is preferential mating, the diversity may even increase. Differential mortality, fertility or differential tendency to migrate may also influence the distribution of types and the taxonomic appearance of the general type. Johannsen calls the population consisting of a multiplicity of family lines a phenotype, while the family lines would correspond to his genotypes. The term phenotype is also used to designate the modification of the genotype due to peristatic causes, and some confusion arises if the distinction between these two meanings is not kept in mind. In the latter sense every individual is a phenotype, and genotypes per se are non-existent because all individuals are subject to peristatic influences. A genotype not subject to peristatic influences does not exist.

On account of the overlapping distribution of forms types characterized by the same morphological traits may be found in populations representing different types. The mere fact that certain traits of such individuals are identical must not be interpreted as meaning that they are genetically identical; children of like pairs which belong to different populations will have unlike descendants, for these will tend to revert to the general type of the population to which they belong. Thus children of mesocephalic Bohemians will be on the average more brachycephalic, while children of mesocephalic Sicilians will tend to be more dolichocephalic than their parents.

The taxonomic classification of mankind does not answer the question as to whether the form is determined by heredity or by environment. For an understanding of the significance of racial characteristics the question of the hereditary stability of traits selected for taxonomic description is all important, a fact which was recognized by Meigs, who tried to show by comparative studies the stability of cranial forms.

Among the metric values used by most in-

vestigators are those for which sufficient hereditary stability cannot be proved. One of these is the value of stature. There is ample proof that stature has been constantly increasing among west European and North American populations since the middle of the past century. It must be understood that modifications in metric values do not mean that these measures are entirely non-hereditary. It merely signifies that they are subject to outer influences, whose extent should be known if they are to be used for a classification which has a genetic value. Non-hereditary variations are called paravariations; those genetically determined, idiovariations. When stature is used as a criterion and it increases by reason of outer conditions, a people may pass from a type characterized as of medium stature to one of tall stature. The same may occur in regard to other characters. There are clear differences in head form between wild animals and their descendants born in captivity; these find expression in the proportions of the skeleton and particularly in those of the skull. The evidence showing analogous changes in head form among European immigrants in the United States has never been disproved. It is not definitely known to what extent these measures may be modified. The value of measures, as genetically significant, depends upon knowledge of the degree to which they may vary under changing conditions. The cephalic index of east European Jewish immigrants who came to the United States between 1870 and 1909 was a little over 83. That of their own children born more than twenty years after the immigration of the mother is a little below 80. Thus the descendants may easily fall into a taxonomic class distinct from that of the parents. Changes like those here discussed are probably not far reaching, although they render a taxonomic grouping of closely allied forms, like those of Europe, of doubtful value as genetically determined types.

Even more important is the problem of the interpretation of the difference in form of fundamentally distinct races, like Europeans and Negroes. Hahn was the first to point out that the mode of life of man is that of a domesticated animal. Since fire and tools were in use in quaternary times, man may even be said to be the oldest domesticated form. Anatomically the analogy between human races and domesticated animals has been substantiated by Fischer and Klatt. Man shares with domesticated animals great variability of bodily traits, while the features of wild animals are much more uniform.

Such traits as form of hair, pigmentation and size which show increased variability likewise differ in domesticated animals. The spiral hair of the Bushmen and the smooth hair of the Mongol, the blond hair and blue eye of the north European and the deep pigmentation of the Negro, the tallness of the Scotsman and the dwarfish stature of the pygmy, are paralleled by analogous phenomena among domesticated animals, while they are absent among wild animals. It is conceivable therefore that the differentiation of races is not as ancient as might be supposed from the contrast of existing forms.

It has been pointed out also that races conform more or less to the constitutional types found in one's own population. It has been shown by Weidenreich that thin, elongated types (leptosomic) and heavy set (eurysoic, pyknic) types occur in every population and that the attempt to analyze a race as derived from two distinct elements is based on a subjective classification, not on genetic evidence. The distinctive constitutional forms are due rather to the relatively close interrelation between all linear measures among themselves and all transversal measures among themselves, while the correlation between the two types of measures is slight. Furthermore the apparent constitutional type depends upon use of the muscular system and upon age. Active exercise of the muscular system stimulates the growth of bones in thickness but not in length, so that energetic muscular activity in youth increases the number of eurysoic individuals. Age also has a decided effect; middle aged persons are on the whole more eurysoic than the young and the very old. It has been observed that city children are on the average more leptosomic than children brought up in the country. It must be recognized that there are certain middle values in each race which according to standards of one race may be leptosomic or eurysoic, but which form the central point from which more slender or more heavily set individuals deviate. Observations as to constitution in one race cannot be transferred directly to another.

The activity of the endocrine glands has a decided influence upon the development of the body of an individual. Removal of testes or ovaries leads to disturbances of growth. The secretions of the thyroid and pituitary glands and of the adrenals have a distinct influence upon bodily form. If the secretions were subject to local influences, they might bring about modifications of bodily form in local groups.

Their role in the differentiation of races has not been determined.

It seems quite certain that such differentiation of fundamental forms as now exists must have developed during periods of isolation of small groups. Such periods must be quite remote in time, for there is clear evidence of constant migrations and intermingling of peoples. For Europe the example of the history of Spain, at present a part of the continent least affected by migration is instructive. In early times it was inhabited by Iberians whose racial affiliation is not determined in detail; later Phoenician colonies were founded along the coast. During the era of Celtic migrations waves of these people entered Spain from France. Then followed Roman colonization. Still later Germanic tribes invaded the peninsula and remained for a long time the governing class. Invasions from north Africa brought a large part of Spain under Moorish dominion. Large numbers of Jews settled in Spain during the early centuries of the modern period and intermarried with other elements of the population.

The Celtic tribes swarmed southward, northward and eastward. They occupied the British Isles, entered Spain and Italy and finally one of their groups even established itself in Asia Minor. The Germanic tribes, which had formerly lived in the area extending from the Black Sea to the North Sea, migrated westward and southward; deserting their eastern homes and invading western and southern Europe, they even reached north Africa. Their former homes were largely taken over by Slavs who expanded northeastward from their home somewhere in southeastern Europe, intermingling particularly with Finnish tribes. Later the Germans reoccupied part of the territory they had given up earlier and assimilated the people east of the Elbe. While these migrations can be followed historically, others may be inferred from evidence of prehistory. Thus the people speaking Italic and Greek languages must have superseded previous occupants of the southern peninsula of Europe.

The same conditions prevailed on other continents. Peoples related to the Malays of southeastern Asia migrated eastward, inhabited the islands of the Pacific Ocean and reached westward Madagascar on the east coast of Africa. The Turkish peoples expanded from central Asia into Siberia and southward into Europe. In America the Athapascans extend from the Arctic coast into northern Mexico, the larger

groups living in the subarctic area from Hudson Bay to Alaska and in the Rio Grande region, while small groups are found in many localities near the Pacific coast. In South America the Caribs are scattered over a vast territory. The relations between these groups have been determined by linguistic comparisons, but since languages spread only by personal contact and almost always by intermarriage they are satisfactory proof of migration.

Even in earliest prehistoric times migrations must have occurred. The sudden change from the Neandertal type prevailing at the end of the older palaeolithic period to the new type of the later palaeolithic can be explained only by migration, for there is no ground for assuming that the new type developed suddenly in Europe. One of the greatest early migrations must have been the invasion of America, which may have occurred toward the close of the ice age. Since no predecessor of man has been found in America and there is a close relation between the American Indian and the Mongoloids, it must be assumed that there was an immigration from Asia, early enough to have allowed for a gradual movement of bands which spread from the Arctic through the tropics to the extreme southern part of South America and which became differentiated during this migration.

The period of isolation must have been exceedingly remote and it may be expected that an intermingling of types will be found almost everywhere. It is therefore particularly important that the effect of intercrossing be understood. Even if the evidence offered by prehistory and linguistics regarding the early migrations of man be set aside, the degree of variability of most local types has led to the impression that in most populations several types are present which have to be segregated. Such segregation presents serious difficulties arising from the subjective character of the type. The previous experience of the person who establishes the type concepts will to a certain extent determine the types recognized.

The analysis of a population has been attempted from the point of view that certain of the arbitrarily selected groupings of measures have been assumed as characteristics of primary races, so that, for example, the combination of low cephalic, facial and nasal index would characterize a primary race and the number of races would be determined by the eight possible combinations of these features. On account of the great variability of racial forms this leads to the

assumption that every one of these arbitrarily constructed primary races would occur in almost all parts of the world, and by necessity other characteristics, such as pigmentation and hair form, would have to be considered as varying under external conditions. Genetically groups of this kind are unstable. They contain only extreme constitutional forms in a mixed series and the children of parents of extreme form tend to revert to the middle forms of the population. For this reason also their value as primary racial groups cannot be accepted.

In a number of cases it can be shown that a population is actually mixed. In a homogeneous population all the measures of an individual will increase simultaneously. For instance, length and breadth of head will both increase with increasing stature. This would be expressed by a positive correlation between these two head measures. When the population is descended from one ancestral group, a part of which has long and narrow heads, and from another with short and broad heads, the longer heads will have less breadth than the shorter ones. There will be a strongly diminished or even negative correlation due to mixture. Conversely, if one type has small measurements and the other large measurements, there will be an increase in the value of the correlation. Such disturbances of normal relations may reveal the intermingling of types, although the components, unless actually found in some locality, cannot be reconstructed. Even in this case it would be necessary to know the purely biological relation between the measures, before the attempt at determining the degree of mixture could be made. For these reasons attempts to analyze populations according to the racial descent of the component elements have not been very successful, and the manner in which bodily traits are transmitted makes it very doubtful whether it will ever be possible to segregate the constituent parts out of a population of mixed but unknown descent.

It is essential to know the exact laws of inheritance in mixed forms, a subject about which knowledge is still inadequate although the problem has received some attention. According to Mendelian laws a splitting up of racial characteristics may be expected in certain cases. This simple form of effect of continued crossing between distinct types has not been observed very often. Even before the rediscovery of the laws of Mendelian inheritance von Luschan had observed a reversion to parental types in the head index of the population of Asia Minor, which

he considered as descendants of a very early mixture of the round headed Armenian and the long headed Syrian type. The clearest case is the splitting up of the descendants of blue eyed and brown eyed parents, who follow very closely the simplest forms of Mendelian inheritance. No absolutely certain cases of brown eyed descendants of pure blue eyed parents are known, while crosses between heterozygous brown eyed parents, that is, descendants of parents who each had one blue eyed and one pure brown eyed parent, have nearly 25 percent blue eyed and 75 percent brown eyed children. For the head index an increase of variability has been shown with increasing difference between the corresponding indices of the parents. The width of the face of half blood Indians shows a decrease in variability and at the same time apparently two maxima of frequency, one corresponding nearly to the white, the other nearly to the Indian ancestry. The stature of white-Indian half bloods is greater than that of either ancestral form. Herskovits has shown that for many traits of the mulatto variability is not increased, while according to Barnes the variability of skin color is greatest for quarter Negroes. It has also been shown that the fertility of white-Indian half bloods is greater than that of pure Indians. Evidently the laws of inheritance of different traits are varied and for this reason also a purely statistical analysis of the distribution of traits in a given population cannot be made. A comparison of races must therefore be based on the genealogical study of the component family lines of populations, and the more this is done the less fundamental the difference between racial types appears to be. When racial types like Negroes, Mongols and whites are compared, a purely morphological basis may be used in which the distinguishing characteristics of the race may be discerned; but whenever the features overlap genealogical study becomes indispensable.

Recently much stress has been laid upon the possibility of analyzing races by means of blood groups. Bernstein derives from the behavior of heredity of blood groups the existence of three fundamental racial types, the mixture of which has resulted in the distribution of blood groups in modern populations. The striking difference between the blood groups of the American Indians and the races of the Old World is in curious conflict with the morphological similarity between Indian and Asiatic racial types. The fullest material is available from Europe, where curiously contradictory results have been

obtained. It would seem according to Lattes that in closely inbred groups characteristic distributions of blood groups develop, while no appreciable differences are found between more widely scattered groups, such as the Jews of Berlin and Poland, when compared with the remainder of the population of the same places, or between Lapps and Swedes of adjoining territories. In all races, except perhaps among pure American Indians, who may have only one of the recognized blood groups, all groups occur in varying frequency. It seems doubtful whether it is justifiable to claim that every racial type containing the various blood groups must be a mixture of distinct races. So far attempts to correlate blood groups and morphological form have not led to any positive results. The statement of Lattes that the blood group is a character of the same order as pigmentation or shape of the skull is probably a correct summary of present knowledge of the problem.

In a comparison of man and the anthropoid forms a number of striking resemblances are found which indicate the direction in which man has diverged and specialized. The special forms developed in the various races do not show that one can be considered as more advanced from the prehuman type than another. The divergences are rather in different directions. Thus the Negro is most divergent in the increased length of legs and in the strong development of the lips; the Mongoloid in the loss of hairiness; the European in depigmentation, reduction in the size of the face, elevation of the nose and increased size of the brain. The last of these features might perhaps be considered as the most important deviation from lower types, but it is not the sole property of the European. The largest brains are probably found among the Eskimo. The Australian represents perhaps the only racial type characterized by less specialization in specifically human traits than others, but even in this case the divergences from animal forms are in such directions that he can hardly be placed on a lower evolutionary level as compared with other human races. It must also be remembered that the reduced size of the face of the European and the projection of the face of the Negro may be due to influences of domestication, since these forms occur among domesticated races, so that they would have to be considered as secondary modifications rather than as evolutionary stages.

The racial differences in average size of brain are slight as compared with the individual varia-

tions which occur in each race, so that a considerable amount of overlapping occurs. Extremely large values may be rare or absent in one race, extremely low ones in another, while in the bulk of the population the same middle forms will occur. It is not justifiable to identify size of brain and intelligence. The size of the brain depends not upon the number of nerve cells and fibers and their connections, but to a much greater extent upon tissue which has nothing to do with nerve activity. The configuration of the sulci of the brain is also so variable that nothing definite can be inferred therefrom. There are relations between the form of the skull and the configuration of the brain, but the observation of artificially deformed heads suggests that there is no functional relation. The existence of fundamental structural differences likewise has not been proved.

The general question of the cultural significance of race hinges upon the problem of the functioning of the body. While the anatomical form of the adult is almost stable until the time when senility sets in, the functions depend upon varying conditions to such a large degree that a constant, typical value for a measurable function can be given only with great difficulty. The metabolism of the body may be cited as an example. In order to obtain results that are in any way comparable it is necessary to see that sufficient time elapses after the last meal, that there is no exertion of any kind in the period preceding the test and that body and mind are completely relaxed. Unless these conditions are fulfilled the results of the test will differ greatly. Similar conditions prevail in regard to the functioning of the heart. Exercise and excitement accelerate the heart beat, and the amount of available oxygen also has an influence. It follows that an individual who lives in a temperate zone at sea level and leads a quiet inactive life will react quite differently when taken to a high altitude where he has to do strenuous work. Within limits the organism is perfectly adjustable. There is a margin of safety within the limits of which the organism is adjustable to a variety of conditions. It follows conversely that in many cases representatives of different races living under similar outer conditions will appear functionally alike, while individuals of the same race living under different conditions will appear quite distinct. Phenomena of this kind have been observed in the development of the individual. Thus the period of sexual maturity of the well to do is accelerated as against that of the poor;

there are differences in the time of dentition and in the climacterium. In a number of cases the same environmental conditions may emphasize differences of type; for instance, in the effect of sunburn, which darkens darkly pigmented types while it reddens those of light complexion.

What is true of physiological functions is equally if not more true of mental reactions. Even such a simple psychophysical phenomenon as reaction time is subject to enormous fluctuations according to the presence or absence of distractions. A certain minimum value may be found for each individual, but the slightest diversion of attention brings about a rise in the reaction time. The variability of the emotional tone of the individual is so obvious that it does not require experimental proof. The differences between mental tone in fatigue and after rest are also obvious.

In the study of anatomical form of the adult only the serial variability must be taken into consideration, for each individual remains stable. In the study of function recognition must be given to a high degree of variability in the individual which is added to the purely structural determinant. It is therefore not surprising that individuals of the same descent react differently under varying outer conditions.

Because of the difficulties of precise quantitative determination of mental traits it is not easy to give satisfactory data in regard to all mental traits. The dependence of such reactions as are measured by various types of intelligence tests offers a fairly satisfactory answer to mental phenomena which can be reached by these methods. Thus Brigham found that among groups of Europeans who had immigrated at various times and had been subjected to intelligence tests those who had stayed longest in the United States gave the best results. While originally he ascribed this to the immigration of more poorly equipped stock in later years, subsequently he withdrew this conclusion. It seems more plausible that the improvement is due to a gradual assimilation to American speech and customs. Klineberg found this to be the case among Negroes migrating from rural districts to cities. The evidence in regard to mental differences between races has been assembled by Garth, who reaches the conclusion that no essential differences have been proved.

The attempt has also been made to evaluate the functions of individuals of different racial types living in the same geographical and social environment. While it is exceedingly difficult to

find an absolutely equal social environment, it may be assumed that it exists approximately in groups living socially on equal terms. The attempt to find definite correlations between European types and their mental performances have not shown any such relations; on the contrary, the only constant difference found is that between rural and city populations.

It would be rash to infer from these observations that there are no differences whatever in the distribution of biologically determined intellect or personality; if exactly the same conditions could be attained for a sufficiently large number of individuals, biologically determined differences might be found, but it seems impossible to attain sameness of conditions. The only safe conclusion to be drawn is that careful tests reveal a marked dependence of mental reactions upon conditions of life and that all racial differences which have been established thus far are so much subject to outer circumstances that no proof can be given of innate racial differences.

Just as in consideration of bodily form individual heredity has to be emphasized as against the fictitious heredity in a large group consisting of many distinct lines of descent, so the same distinction has to be made in regard to mental traits. The tenets of the behavioristic school of psychology, in so far as they deny all influences of bodily build upon mental activities, can hardly be maintained. The contrast between the extremes, between idiot and genius, contradicts their assumption; if these are dependent upon bodily build, then lesser differences also will find expression. It is intelligible, perhaps demonstrable, that identical twins or members of a family show similarities in behavior that are, in all probability, hereditary. In a larger, not inbred group there must be so many differences between family lines that it is not possible to speak of racial heredity.

The observation which has given particular strength to the assumption that bodily form and mental characteristics are closely correlated lies in the peculiar distribution of human types and of culture. In each area a certain type and a certain culture are found locally associated. Similar conditions may prevail in social strata of the same population, and from this the inference is drawn that they must be causally related in the sense that bodily form determines the culture. Such an inference is admissible only if it can be substantiated by biological evidence. The limits of racial types are not clean cut, and similar individuals always occur in neighboring

groups. The limits of distribution of cultural types are also not distinct and do not conform to the limits of racial types. The type of one area is defined by its main features, and the culture of the same area is also characterized by its chief traits. If the geographical grouping is made by racial types, there must result a corresponding grouping of cultural traits which is due to the selection of areas (or sections of a population) without any necessary causal relation between the two groups of traits. A positive answer to the claim that racial descent determines mental characteristics would require proof that without regard to cultural environment and to location the same type must always produce the same mental characteristics.

If there is any truth in the fundamental generalizations of Mendelian inheritance, it must be expected that various traits of the body which are not intimately associated are inherited independently of one another, so that in the intermingling of genetic lines ever new combinations will arise. It has never been proved that form of the head, color of hair and form of nose have any intimate association with mental activities. Karl Pearson has followed a rigid method in investigating such possible correlations and his results are entirely negative. Unless such proofs can be given, the interpretation of character by bodily form remains as imaginary as that of the phrenologist. The weak correlation between constitution and pathological conditions, and particularly mental diseases, might be brought forward as indicating the possibility of such relations, but even here no one would claim that every person of leptosome type must be manic depressive and one of pyknic type schizophrenic.

It must be emphasized that no proof has been given that the distribution of genetic elements which may determine personality is identical in different races. It is likely that there are differences of this kind, provided the anatomical differences between the races are sufficiently fundamental. On the other hand, the study of cultural forms shows that such differences are altogether irrelevant as compared with the powerful influence of the cultural environment in which the group lives. While each individual may react in his own way to the culture in which he lives, the behavior of the whole group conforms to its standards. This conclusion was expressed by Waitz as early as 1858 and is the basis of all serious studies of culture.

RACE CONFLICT. Race conflicts are among the most important factors of political and social unrest in the contemporary world and their significance increases as racial feeling grows in emotional intensity. Historically such conflicts had their origin in the migration of races and in the conquest of territories already inhabited by other races. Sociologists like Gumpłowicz and Oppenheimer hold that states were founded upon conquest and migration and that in organizing society the conquering race constituted itself the ruling class, while the conquered were relegated to servant status. Race therefore became a factor of social superiority, and the philosophers of the ruling race soon made it appear to be a factor of moral and intellectual

superiority and of political capacity. The members of the ruling or conquering race, who had all the opportunities for social and cultural development which they denied to the members of the conquered race, came to think of themselves as alone capable, by nature or by the will of God, of providing political and social leadership in the interests of the lower races themselves. The attempt to justify the vested interests of racial exploitation in terms of a mythology of racial superiority found its classical expression in Aristotle. The sophists had taught that the differences between free men and slaves were set by human convention, that slavery had been established by force and was therefore unjust. Aristotle, on the contrary, maintained that the differences between free men and slaves were set by nature, that some races are destined to mastery and others to slavery, involving a burden for the master and a benefit for the slave. In the Aristotelian view racial conflicts are not historical or sociological phenomena but belong to an eternal order of God or nature: there is no hope of changing racial inequality into equality by patient educational and social work or by revolution; race conflicts can be avoided and a natural harmony arrived at only if the inferior races accept the status imposed upon them by eternal law. This school of thought regards racial prejudice as a fundamental human instinct.

Class differences have been explained in terms of racial differences by such writers as Henri de Boulainvilliers, who conceived of the French aristocracy as Franks, or Germans, who had subdued the native French Gauls, or Celts: the political, social and economic inequality of the classes in France was thus justified by and based upon irreparable racial inequality. Sieyès, in his *Qu'est-ce que le tiers état?* (1789), explained the French Revolution as the effort of the conquered race to expel the ancient conquerors and thus to right a historical wrong by restoring the third estate to the noble rank it had held before the invasion of the Franks. Gobi-neau, in his *Essai sur l'inégalité des races humaines* (4 vols., Paris 1853-55), held that the Germans, whom he identified not with contemporary Germans but with the French aristocracy, were the supreme race and the initiators of all human progress. Houston Stewart Chamberlain and his German followers have ascribed all civilizations in the history of mankind to the influence of conquering German tribes and attributed the decay of those civilizations to the

intermarriage of these tribes with the native races. All civilization was considered the work of an aristocratic élite which belonged to races with creative faculties, while other races were purely recreative or even destructive; the domination of the world by the creative élite was therefore held to be in the interest of the backward races and of humanity as a whole. The colored races and the Jews were described as outstanding examples of races with purely destructive and imitative capacities and thus unfit for cultural work. With the ascent to power of Hitler's government in Germany in 1933 this theory became the official doctrine of the German state and of German science, it has stirred racial pride and prejudice to feverish heat and has become an obstacle to a peaceful and progressive solution of race conflicts.

The suppressed races and classes have pointed to the philosophy of equal rights in protest against the theory of permanent race inequality. Indeed the doctrine of human equality and of the natural or divine rights of man, often derided by the racialists as anaemic and purely intellectualistic and which seems as deeply rooted in man's mental make up as is the "we-group" of the racialists, has repeatedly been taken up by intellectual members of the ruling races and has influenced their actions. Alexander the Great, who against the advice of Aristotle treated Greeks and barbarians alike and had them intermarry, introduced the age of Hellenism; the Roman Empire gave the concept of racial equality its political form with the broadening of Roman citizenship; the Stoa formulated its philosophy; early Christianity contributed its religious fervor. *Phil-anthropia* and *humanitas* became the regulating factors of human group intercourse. The doctrine of equality and fraternity was taken up in secularized form by the age of rationalism and by the French Revolution of 1789 and the Russian Revolution of 1917, both of which had their deepest roots in the same soil as primitive Christianity—the messianic hope that oppressed races and classes will change the present order of society into one granting equal rights for every human being and thus, among other results, eliminate race conflict.

As long as the lower races accept their position as natural or as ordained by God, as long as they do not feel the humiliation and discomfort of their status, race conflict is not acute. Official religions often help to prolong the established order by preaching to the lower races the ne-

cessity of obedience and promising the consolation of a better world after life. Subject races in their efforts to rationalize and justify their misery may arrive at a theology or folklore which embellishes their pauperized lives by attributing some particular moral genius to it. They may accept the prestige of the superior race and may try to imitate it; dominated by self-pity, they may take over not only the rule but also the standards and the tabus of the master race. But in the theology with which they support their misery there is almost always a messianic element of hope, which under favorable circumstances may develop into self-consciousness and the spirit of revolt. The submissive pariah is in good favor and is even sometimes patronized by the master, but the pariah's claims arising out of his newly won self-consciousness are actively resisted. Any attempt at change provokes active measures of suppression. The powerful races, fearing that they will lose their superior economic and social position or be obliged to share with the exploited, often have employed coercive measures, which have merely increased the militancy of rebellious races. Often oppressed races are apt to become, after their liberation, oppressing races, and to show in their turn prejudices and insistence on privileges not unlike those under which they themselves had formerly suffered.

Racial contacts and therefore racial conflicts became more general with the approach of the age of imperialism. The tendencies of restless growth and expansion inherent in industrialism and capitalism soon led Europeans to seek raw materials and new markets all over the world. They brought with them the products and the methods of a higher civilization, and the nature of the ensuing conflict was determined by whether the European conquerors met peoples with a highly developed civilization and with strong indigenous political organizations or primitive tribes. In the first case, as illustrated by China or India, the net result of the contact may in the long run prove favorable to the natives; in the second case, as in North America, Australia and the Pacific islands, it has been irreparably detrimental; in Africa, which occupies an intermediate position in this respect, it may ultimately strengthen the Negro race. In any case the conflict of races created by the invasion of a territory by a stronger or more advanced race has tended to intensify the struggle for existence of the weaker race and to disorganize its culture and social structure. The nature

of the race conflicts also has depended upon the economic conditions and the cultural background of the conquering race. In North America, where the invaders were animated by an intense race superiority complex, the Indians were driven into the less habitable areas or were exterminated, whereas in the plantation regions of Latin America, where a more humane attitude prevailed, the Spaniards allowed the Indians to remain on the land and forced them to work for their new masters, thus preserving their means of subsistence and allowing for their slow adaptation to the superimposed civilization. Generally the more warlike and the more highly developed agricultural tribes have shown the greatest power of survival in contact with Europeans; governments have always treated the militant tribes with much more favor than the complaisant ones. In Africa, partly because of climatic conditions, white settlement was much more restricted than in America or Australia and the Negroes have proved to be a stronger race. But the slave trade, forced labor and imported diseases, like syphilis, have led to depopulation in many parts of Africa and have destroyed Negro civilization and tribal structure. The difficult adaptation to new conditions and to forced labor brought about by the imperialist penetration of Africa since the abolition of the slave trade has not given Negro society opportunity to recuperate.

The period after the World War has been marked by a world wide effort of oppressed or backward races to change their status. The awakening of the masses throughout the East, the Bolshevik educational efforts on behalf of the racial minorities, the activities of the Republican regime in Spain, the agrarian unrest in southeastern Europe, the new spirit everywhere among the Negroes, the revolts of the long suffering Indians of Central and South America, are all movements involving dynamic change in race relations. Liberalism in its original meaning is spreading its influences over all parts of the earth untouched by its victory in Europe in the eighteenth and nineteenth centuries. The rationalist gospel of Europeanization unites with the Christian gospel of missionaries and the socialist appeal of revolutionaries in creating a new self-consciousness among the oppressed or backward races.

The major contemporary arenas of race conflict are now the Pacific regions, where the white and the yellow races are struggling for supremacy; the United States with its Negro

problem; and the Indies and Africa. As the Negro race is the most numerous of all the backward races and apparently the only one capable of resistance and survival, the result of its struggle for emancipation will determine to a large extent the future nature of race conflict and race prejudice all over the earth. In India the caste system has long been built upon racial differences and conflicts and has been perpetuated by religion. But only in recent times has the system of capitalistic exploitation introduced by the whites made race conflict a universal phenomenon. The migration of races, caused by overpopulation and economic want and attempts to escape from exploitation and persecution, has led to the further widening of the area of conflict. The Indian migration to south and east Africa led to typical race conflicts; Japanese and Chinese immigration to the Pacific coast of North America and to Australia provoked a vehement outbreak of antagonisms and restrictive immigration laws. The policy of white Australia based on the fear of competition may be considered as part of a policy of compulsory segregation on a world wide scale. Sometimes immigration of backward races is promoted by capitalists to obtain cheap or docile labor to break strikes or to counteract trade unionism; such importation of alien races, vehemently opposed by white labor, sharpens race conflicts and sometimes leads to race riots.

The economic roots of race conflicts are certainly strong; but there is also an irrational element, the belief in the superiority of chosen races, which cannot be explained in economic terms. Although bound up in many ways with economic consequences, race prejudice and racial feelings prove more significant and more persistent than economic considerations and at times even operate counter to economic self-interest. In the antisemitism of Hitlerism the desire to dispossess Jews from positions coveted by Aryans constitutes a very strong economic motive, but other and stronger motives are also involved. In the interests of their racial aims men often override their class interests and violate their class solidarity; this fact is regularly manifested in the attitudes of workers of the advanced races in areas where there is conflict with backward races. The members of the white race in the south of the United States feel their racial supremacy threatened and have therefore presented since 1860 a united front which has surmounted all class and party distinctions and has been bent upon maintaining race domina-

tion. In South Africa all differences of nationality or class among the whites recede quickly and completely into the background when the native problem is discussed. There all economic measures are related to race conflict; the inferior race is maintained in the status of an inferior class, and therefore racial and class conflicts often coincide.

Class conflicts are aggravated when racial conflicts are involved by strong emotional resentments, which tend to persist even after the apparent cause has disappeared. Outwardly calm racial relations may suddenly become transformed into overt conflict, whereas changes toward the better proceed slowly and the remembrance of past or supposed wrongs shows astonishing powers of survival. Race prejudice and the desire of the stronger or more advanced races to maintain their status debar the inferior, or backward weaker, races from attaining equal opportunities in the social and economic field. The color line, which is to be found in varying degrees wherever different races live side by side, prevents the weaker races from realization of a fuller life, cuts off from them all possibilities of rising and makes both races permanently conscious of their differences. In racial conflicts the individual plays no role; the most friendly relations may exist between individuals of different races, but the color bar acts always to deter members of the lower race from the struggle for higher qualification and efficiency. Sooner or later it leads to a policy of racial segregation designed to retard the progress of the natives and to continue their exploitation.

At the root of race prejudice is an aversion to strange appearances and ways of life which are often held to be proof of inferior standards; such attitudes are strengthened by the desire of the dominating group to maintain its solidarity. Inter-marriage and social intercourse are legally or tacitly prohibited, and the superior race generally asserts its superiority by reserving all economic advantages to its members. The contact of races in different stages of agricultural development has led, wherever conditions have been conducive to the settlement of members of the stronger race, to the concentration of the best lands in their hands at the expense of the natives, who are sometimes left without sufficient good land to yield even a precarious living. The native must then be content to be allowed to work at a very low wage and under most exacting conditions for the members of the dominant race, who try to perpetuate their

power by depriving their inferiors of all political rights.

Racial conflict leads to strong discrimination against members of the weaker races in the struggle for employment in industry and in the professions. They are excluded from higher paid positions and from skilled occupations with which social prestige is connected. The workers of the more progressive or powerful races often exclude members of the underprivileged races from the trade unions and bar them from apprenticeship. The latter are forced to work at lower wages and are therefore sometimes solicited by employers who can exploit them more easily than the organized and better educated workers. Excluded from the trade unions and from the protection and possibilities which such organizations offer, members of the oppressed races often become strike breakers as the sole means of entering certain occupations. During the steel strike in the United States in 1919 many Negroes obtained responsible and highly skilled positions and carried out their tasks with efficiency, but when the strike ended they were largely replaced by white workers. Although the exclusion of the oppressed races from the trade unions ultimately works to the detriment of the privileged workers, race prejudice has been stronger than economic interest. This policy of exclusion tends to maintain and to perpetuate the differences in the standard of living, in the scale of wages and in the training of the two races; it widens the gulf between them and embitters their relationships. Workers of different races receive unequal pay for equal work and are employed under diverse working conditions, members of the underprivileged races being obliged to accept the dirtiest, most dangerous and most difficult jobs. The prestige of the dominant race is strengthened by better housing conditions, while debased standards of living are often forced upon the suppressed races. Thus the races are kept distinctly apart and cannot arrive at the degree of mutual esteem and self-esteem necessary for the establishment of friendly relations. The cleavage is aggravated by the fact that faults of individual members tend to be ascribed to the entire race and repressive measures affect not only the guilty or suspected but the whole group.

Race conflicts lead easily to race riots; either the despair of the backward race finds no outlet other than desperate resort to violence or the dominant race resents the efforts toward emancipation of the backward race and avenges any

act of revolt. The hostile and brutal atmosphere of race riots and of lynching (*q.v.*) is not confined to a few cases of violence but is the basis of the unequal treatment before the law meted out to the different races. Not only are judges and courts dominated by passion, but there are varying standards of judgment and punishment for the different races; the judiciary is often composed entirely of members of the ruling races and offenses are punished according to the race of the defendant and of the plaintiff. Racial inequality is thus conducive not only to the destruction of democracy and liberty but also to the undermining of justice and law.

In many countries there is a tendency to minimize the importance of racial conflict in the interests of the ruling races and frequently there is hypocrisy about the benefits accruing to the backward races by their cohabitation with more progressive races. While a semblance of tranquillity can be maintained by armed superiority the problem is ignored. But with the growing world wide insurgence among the backward races and with their more articulate expression of resentment the policy of drift becomes impossible. Then, often under the cloak of humanitarianism or science, a policy of repression by compulsory racial segregation is frequently undertaken. Racial integrity is protected by laws forbidding interracial marriages; benefits derived from government are reserved for the dominant races; participation in government is denied to the oppressed races, who are discriminated against in all phases of social life and receive not only different but definitely inferior education and living quarters and a disproportionately small share in public services.

On the other hand, the awakening of underprivileged races is stimulated by the equalitarian and humanitarian policies of the Soviet Union, where a determined stand has been taken against race discrimination. The rational belief in the complete equality of all races has become the official creed, and energetic educational efforts are being made to raise the social and economic conditions of the underprivileged races. Whereas in many parts of the world ruling classes or imperialist governments instigate or refrain from suppressing race conflict for reasons of hegemony or exploitation, communism helps to organize backward races in their struggle for political and economic advancement and liberation. This assistance contrasts with the attitude of many white labor and socialist groups among whom race interests are stronger than class interests.

The help given to backward races by communists emanates not only from their identification of racial and class conflicts and from an alliance against the capitalist and imperialist powers but also from the fundamental policy against race discrimination within the Soviet Union. Bolshevism continues, in a rationalized and secularized form, the stand of primitive Christianity against race discrimination; but the equalitarian Soviet theory goes farther than most Christian agencies in tackling not only the psychological and emotional causes of race conflicts but also their economic roots. The Soviet Union now is the only large area inhabited by many races, free, as far as governmental agencies are concerned, of any form of race prejudice.

The growing acuteness of race conflict has recently attracted the attention of religious and humanitarian bodies. Islam in theory as in practise has never known a color bar, which largely explains the appeal it has exercised among African races; but Christianity has not as a rule lived up to its precept of the brotherhood of man. Of late, however, Christian and humanitarian bodies have begun to recognize the necessity of a definite stand on the race question. The conference of the International Missionary Council in Jerusalem, for example, declared in 1928 that "any discrimination against human beings on the ground of race or colour, any selfish exploitation and any oppression of man by man is a denial of the teaching of Jesus." The Commission on Inter-racial Co-operation, founded 1918 in Atlanta, Georgia; the American Interracial Peace Committee, established 1926 with headquarters in Philadelphia; the Commission on the Church and Race Relations of the Federal Council of Churches of Christ in America, are just beginning to explore the field of peaceful race relations. Christian missions in Africa and Asia, often in the face of opposition on the part of white settlers and colonial governments, have imbued the natives with a spirit of self-consciousness and individual human dignity, have helped to develop leadership among the backward races and to train natives in different branches of social and economic activity.

A peaceful solution of racial conflicts demands equal opportunities for all races in all occupations and professions and equal rights in the exercise of citizenship. It cannot be attained without vastly increased facilities for the backward races in education, in capital equipment and in the development of resources in their

interest. Racial relations today present more dangerous features in the field of interhuman relations than any other point of conflict. Nowhere are mob passions, prejudices and fears so easy to evoke and so difficult to check. If they are to be prevented from crystallizing into custom and sometimes even into law, there must be a conscious and persistent effort by all religious and rational forces which subscribe to the idea of equality of men and of races. Unless decisive changes are made in the attitudes and practises of dominant toward backward races — and such changes are not now in prospect outside of the Soviet Union — wars and revolts must inevitably result.

RACE MIXTURE. The hybrid character of present day human physical types is the result of a process of racial crossing which has continued for countless generations. With the possible exception of a few highly inbred groups of an originally homogeneous stock whose members, because of geographical isolation, have had no contact with outsiders, there are no human beings whose genetic composition is such as to fulfil the requirements of the biological concept of the pure strain. This conclusion is not only supported by the testimony of historic fact where available, but is also to be inferred from the degree of variation which marks most existing populations, and which indicates that sexual attraction is no respecter of racial lines, that where any two human groups meet, crossbreeding results even where the most rigorous social restrictions are imposed.

Human hybridization is thus universal; certain populations, however, represent crossing to a greater degree and between more divergent types than others. Examples of these extreme cases of race mixture have been studied in the Boer-Hottentot crosses of South Africa, the Indian-Spanish mixtures of Yucatan, the Indonesian-European mestizos of Kisar, the Polynesian-Chinese-European hybrids of Hawaii, the offspring of Indian-north European matings in the United States, and the Negro-white-Indian crosses of the islands of the Caribbean Sea and of North America. In recent years, these have been made the subjects of special investigation by those concerned with the problems, both scientific and practical, involved in the study

of human biology and of the relation between human physical type, intellectual capability and cultural behavior.

It is logical that these mixed populations should have been made the subject of special study, for although the investigation of problems concerning human beings ideally demands a methodological rigidity attainable only under laboratory control, it is only in such racially mixed groups that approximations of the laboratory situation are to be found. Where the racial derivation of the ancestral stocks is a known quantity, it is possible to study the parental types, if not the individual ancestors, of the mixed breeds; by means of recorded genealogies, where these are available, or of genealogical statements given by the persons studied, where records of matings cannot be had, it is possible to determine to some extent the ancestral racial composition of the several members of the mixed group.

Practically every investigation of a racially mixed population which has been made during the present century has been focused on the question of the extent to which Mendelian ratios are discernible in human mixed offspring, a question which, because of the small size of human families, turns largely on the matter of the comparative variability of the traits measured. If simple Mendelian heredity determines the physical characteristics of crosses, then the variability of a mixed population, in those traits where the parent stocks differ from each other to a significant degree, must exceed that of either of the parental types. The available evidence is far from clear in indicating whether or not this increased variability marks the hybrid groups which have been subjected to study. Fischer's classic analysis of the Rehoboth Bastards (Dutch-Hottentot crosses) shows that the population had achieved a relatively great degree of homogeneity through inbreeding several generations after the initial crossing had occurred, although the numbers of cases were not large enough to make these results of as great significance as other phases of this work. Davenport and Steggerda, whose investigation of Jamaican Negro-white crosses contradicts those findings, also draw conclusions after studying a number of individuals which is too small to allow much weight to be attached to the results. Williams, who measured larger numbers of Spanish-Maya crosses in Yucatan, found relatively low variability, and these findings are comparable to those of Herskovits for Negro-

white hybrids, where several thousand individuals were studied. Shapiro's investigation of the limited number of white-Polynesian crosses in Pitcairn Island also fails to show any impressive increase in variation when the mixed bloods are compared to the parental stocks. Neither Sullivan's study of Sioux-white crosses, Rodenwaldt's measurements of the mestizos of Kisar, nor Dunn's analysis of mixed Hawaiians answers this question decisively.

As a result there has been in recent years a reevaluation of hypotheses concerning the importance of homogeneity as an index of racial purity. Since it was assumed that a hybrid population must exhibit greater variation in physical traits than its parental types, it followed that low variability was an index of racial purity. However, the studies of racially mixed types have forced the conclusion that, given an initial mixture and consequent inbreeding, there is an intensification of the resulting hybrid traits and the formation of a new homogeneous type. This is what has apparently occurred in numerous regions; in a large percentage of traits measured it has been substantiated in the case of the Negro-white-Indian crosses of the United States, the Bastards of South Africa, the Maya-Spanish crosses of Yucatan, the city populations of Italy and the mestizos of Kisar. In the case of the first group, who have been the most carefully investigated from this point of view, it has been seen that in comparing the variability of samples taken at random from the white and Negro populations of the United States, it is the Negroes who, in a majority of traits, show the greater homogeneity. This was shown in studies made by Todd and Lindala, by Davenport and Love (measurements of army Negroes and whites) and by Herskovits. Further, the study of these American Negroes has indicated that the mean values of the traits measured lie between the means of those north European and west African ancestral populations for which comparative data are available. Thus the investigation of the physical characteristics of racially crossed groups indicates a process by means of which the present day "pure" races may have attained their homogeneity after an original cross or series of crosses.

Whether crossed types are better or worse than pure bloods is another moot question. The concepts of "harmonic" and "disharmonic" crosses have been applied to those individuals where the crossing has resulted happily or un-

Race Mixture — Rachel

happily; the difficulty in the use of words bearing evaluative connotations such as these lies in the definitions behind them. As far as has been ascertained, there are no crosses between human groups which carry lethal determinants for the offspring. It is maintained, however, that decreased efficiency results from crossing; that there is a period where "hybrid vigor" is to be seen, perhaps in one or two generations after the original cross, after which debility sets in; that fertility is lost as a result of racial mixture; that internal disorganization comes to the hybrid in consequence of the inheritance of mutually incompatible traits. Neither these claims nor their opposites have been satisfactorily established by objective investigation; furthermore the same assertions may be matched by similar statements applied to inbred populations of "pure" racial stock. Whether or not there is hybrid vigor in man is still debatable, although Boas' pioneer study seemed to show its presence in the case of the stature and fertility of Indian-white crosses. That there is no loss of fertility, at least in the offspring of a Boer-Hottentot hybrid, has been amply demonstrated by Fischer's average of 7.7 children per family in the fifth generation after the original cross.

No greater unanimity of opinion exists regarding the psychological and social results of racial mixture. Although some disagree, the majority of those who have studied the social and psychic traits of mixed bloods hold that the undesirability of crossing cannot be substantiated by objective proof. There is no reason to suppose that such deficiencies as are seen in some hybrid populations cannot be referred to the social situation in which these people are found, especially since there are as many successful hybrid groups as there are those held to be deficient. Psychologists, such as Garth and Klineberg, maintain that studies made of racially crossed folk have failed to show lack of intellectual capability on their part, while sociologists, of whom Young may be cited as an example, find that it is more satisfactory to regard the social behavior of hybrid populations as reflections of their cultural milieu than to refer the matter to biological causes.

RACHEL, SAMUEL (1628-91), German jurist. Rachel, who was a native of Schleswig-Holstein, studied at the universities of Rostock, Jena and Leipsic and later at Helmstedt, where he became professor of moral philosophy in 1658. When the University of Kiel was founded in 1665 he was appointed to its chair of natural law and of international law. After 1678 Rachel became active in politics and diplomacy. He served as a councilor of Duke Christian Albrecht of Schleswig-Holstein-Gottorp, in whose service he remained until his death; he was the duke's ambassador at the peace negotiations of Nijmegen.

During Rachel's lifetime there was a conscious trend in Germany away from scholastic-Romanistic training toward scientific legal study, which concentrated especially upon natural law and Germanic elements. Aristotelian moral philosophy was the basis of Rachel's philosophic ideas and of his fundamental conception of natural law, while the latter dominated his theories of civil and criminal law, as it did those of Grotius, Pufendorf and Conring. In international law, however, Rachel showed a decidedly original approach. In the formative period of international law he was the first prominent protagonist of a positivistic attitude, in conscious opposition to Pufendorf, who had submergered the law of nations in natural law. Rachel stated his position in *De jure naturae et gentium dissertationes* (Kiel 1676). *Jus gentium*, he held, is a system of law independent of *jus naturae* and is based only upon agreements express or implied. Its rules are either general, those which are accepted by most civilized nations, or particular, those which have been established by treaty among a limited group of nations.

Rachel endeavored to free his system of international law from theological, moralistic principles and to introduce utilitarian ideas. His theory of customary and conventional international law substituted the inductive for Pufendorf's deductive method. He realized that the principles of international law are arrived at experimentally and that they may contradict the rules based upon speculative reasoning. He considered the principles of natural law as models for international law, without, however, acknowledging the norms of the former to be the norms of *jus gentium*.

Rachel was the first to establish the significance of international law as a separate science and to stress clearly its legally binding character. Moreover he formulated decisively the principle that not only subjective but also objective law may arise from the contents of treaties. He stands out as the precursor of the eighteenth and nineteenth century positivist movement in international law.

CURT RUHLAND

Consult: Ruhland, Curt, "Samuel Rachel, der Bahnbrecher des völkerrechtlichen Positivismus" in *Niemeyer's Zeitschrift für internationales Recht*, vol. xxix (1925) 1: 112, Ban, L. von, "Introduction" to Rachel's *De jure naturae et gentium dissertationes*, vol. ii, tr. by J. P. Bates, 2 vols. (Washington 1916) vol. ii, p. 7a-16a, Stintzing, R. von, and Landsberg, F., *Geschichte der deutschen Rechtswissenschaft*, 3 vols. (Munich 1880-1919) vol. iii, pt. 1, p. 37-39.

RACHFAHL, FELIX (1867-1925), German historian. Rachfahl was born in Silesia, studied at Breslau and Berlin under Roepell, Caro, Lenz and Schmoller and taught at the universities of Halle, Königsberg, Giessen, Kiel and Freiburg. A meticulous and profound scholar, he was extraordinarily versatile, excelling particularly in critical research and polemic. He began his work in the fields of constitutional, economic and administrative history with *Die Organisation der Gesamtstaatsverwaltung Schlesiens vor dem dreissigjährigen Kriege* (Staats- und socialwissenschaftliche Forschungen, vol. xiii, pt. ii, Leipsic 1894). His "Der dualistische Ständestaat in Deutschland" (in *Schmollers Jahrbuch*, vol. xxvi, 1902, p. 1063-1117) and his writings on the beginnings of modern administrative organization in Burgundy, the Netherlands and Austria and on the Prussian-German question during the nineteenth century have served as a strong stimulus to German historical writing. Rachfahl was keenly interested likewise in the theoretical and philosophical problems of historiography. Under the influence of Max Lenz and the historical writings of Ranke he took an active part in the polemic against the theories and practises of Karl Lamprecht and in his later years against the newer sociological tendencies. He had a profound antipathy to all categories and concepts which were not empirically grounded. In his *Staat, Gesellschaft, Kultur und Geschichte* (Jena 1924) he proclaimed the dictum: "not political or social and cultural history but rather social and cultural history embraced within the higher unity of the history of the state." Rachfahl's most important work dealt with the age of the Reformation and Counter-Reformation. His *Wilhelm von Oranien und der niederländische Aufstand* (3 vols., Halle 1906-24), which unfortunately remained unfinished, is a most comprehensive and objective presentation of the period, unencumbered by ecclesiastical or confessional ties. Born a Catholic, he nevertheless maintained complete objective impartiality. He considered William of Orange the first prominent and successful apostle of the idea of religious toleration among European statesmen. Among his works on the nineteenth century the most important is *Deutschland, König Friedrich Wilhelm IV und die Berliner Märzrevolution* (Halle 1901), which occasioned much critical discussion. He published numerous essays on the Bismarckian era, took issue with Max Weber's thesis on the origins of modern capitalism, and with his *Deutschland und die Weltpolitik*—first volume, *Die bismarck'sche*

Aera (Stuttgart 1923)—which remained unfinished at his death, he was one of the first historians to start work on the collection of German documents published after the World War.

HERMANN ONCKEN

Consult: Rachfahl, F., Autobiography in *Die Geschichtswissenschaft der Gegenwart in Selbstdarstellungen*, vol. ii (Leipsic 1926) ch. vii; Oncken, H., "Felix Rachfahl; ein Nachruf" in *Archiv für Politik und Geschichte*, vol. iv (1925) 579-85; Meyer, A. O., in *Gesellschaft für Schleswig-Holsteinische Geschichte, Zeitschrift*, vol. lv (1926) i-xviii; Below, G. von, in *Schlesische Lebensbilder*, vol. ii (Breslau 1926).

RACKETEERING, a term loosely applied to a variety of criminal schemes, has not yet received exact legal definition. It usually designates, however, the activity for profit (in connection with the sale of goods and services) of an organized group which relies upon physical violence or an illegal use of group pressure to accomplish its end. It thus applies to the operation of an illegal business as well as to the illegal operation of a legal business. It cannot be confined to extortions in business alone, for it includes the use of violence to enforce the rules of illegal activities, such as distribution of narcotics and prostitution. In common parlance also the term is often applied broadly to organized crime or to any easy way of making money.

The word gained currency in the early 1920's, but its origin remains obscure. The first instance of its use has been ascribed to "Big Tim" Murphy of Chicago. Another theory holds that the term was first employed about 1885; two Chicagoans had organized a teamsters' union in New York and an official investigating it is supposed to have said, "This is not a noise but a racket." According to a third theory, racket has entered the modern vocabulary by way of the vaudeville stage, where it means the type of entertainment in which a performer specializes, and hence a special method, generally an easy one, of getting along in the world. There is still another explanation, which is perhaps the most plausible. The word racket has long been used to describe a loud noise and hence a spree or party or "good time." In the 1890's social clubs of young men in New York City, under the auspices of political leaders, gave affairs called rackets; since among their number there were members of neighborhood gangs, it was found easy to coerce local tradesmen to buy tickets. Local gangsters soon improved upon the idea and formed "associations" for the sole purpose of selling tickets in this manner.

The practise of extortion by officials and private citizens has been recorded in many civilizations, although perhaps it was never as well organized as it is under modern conditions. Whenever evidence of organized extortion is found, historical analogy exists. Pertinent instances are the practises of the Greek sycophants and the Roman delators, who, in systems where a private citizen could prosecute for crime, extorted money from guilty and innocent alike under pain of exposure (*see* EXTORTION). The Rhine and Danube barons in mediaeval times, the Barbary pirates, the African and Asian chieftains who preyed upon caravans, the Scotch and English outlaws described in the Waverley novels, the Mafia in the agricultural regions of Sicily—all were virtually racketeers. The levying of periodic tribute against their own depredations marks their status.

Coercion and insistence upon cuts in profits through threats of violence were fully established in the late nineteenth century, as indicated by the practise of "protecting" small storekeepers and peddlers from visitation by the gang itself. Gambling houses and brothels were long subject to extortion by gang leaders, and many murders were traced to disputes over an unearned cut in stuss and other games of chance. The business racket was known early in the century; a study in Chicago in 1904 indicated several rackets in the trucking and clothing industries and during the incumbency of Mayor Mitchel in New York rackets in the foodstuffs, building and clothing industries were exposed. But it was not until the close of the World War and the beginning of national prohibition that the rackets, as they are now known, became widespread.

The racket pattern is not the same in all industries. The simplest type is that in which a monopoly is set up by the racketeers with no other aid than protection by politicians. Illustration is found in rackets in some perishable foodstuffs, where the technique is to coerce retailers through suggestion or ready example of violence to cease buying from the wholesalers and to buy from a new and unnecessary middleman—the racketeer himself. In this type of racket the numbers are few and the investment small, as credit is easily obtained from the wholesalers.

Almost as simple a type of racket is found in the direct association racket, where tradesmen in a market or neighborhood are given "protection" against violence to person and property in

return for the payment of "dues" to an "association" organized by the racket. Failure to pay dues results in visitation by a henchman of the rejected "protector." The more complex the industry, the more intricate is the association racket, functioning through collusive agreements between business men, racketeers and labor leaders. In such rackets the primary object is usually price fixing and the elimination of undercutting; the racketeer is initially called in to enforce the sanctions which under the antitrust laws the association itself could not lawfully assert. The tradesman who refuses to join finds not only that he is subjected to physical violence but that his laborers are "pulled" from the job or assaulted, the movement of his wares is stopped and often his offers to buy goods are rejected, as explicit testimony in New York and Chicago has shown. In some industries the collusive agreements are detailed and ingenious, involving the cooperation of a number of labor leaders and of both wholesalers and retailers; the associations have boards of directors, systems of fines and carefully formulated rules.

Certain of the labor rackets are not operated as part of an association, but the prime movers are the labor leaders themselves. Violence in unions is not new; at times as a matter of self-preservation it has been essential in the struggle of labor for survival, particularly where labor has been rendered powerless by sweeping injunctions. Since the use of force by both sides at the time of the famous Molly Maguires in the post-Civil War period the resort to violence in labor disputes has resulted in the hiring of professional gangsters by both employers and unions.

Strictly speaking, this is gangsterism rather than racketeering; on the other hand, the "shake-down" racket developed by some labor delegates comes close to official extortion. Money payments are demanded and received on threat of pulling jobs for fancied minor grievances or of "breaking" new unions struggling for a foothold or of sending back to work, in breach of trust, men who have legitimate cause to strike or of permitting organized laborers to work at a lower wage scale. From the laborers a "kickback" is exacted for the privilege of working, and contumacy is met with fine and suspension. Some delegates have working arrangements with companies selling construction machines or materials, resorting to sabotage and strikes to combat sales resistance; at times the delegate himself is a contractor on the side. In order to insure iron

control over the union democratic processes are destroyed. Sluggers are brought into the union to keep elections from getting out of hand; soon local elections are abolished and a supervisor responsible only to the international president is appointed. Not all such appointments are to foster corruption, but the method is adaptable to such a purpose. Union funds dwindle away on "swindle sheets" which record their payment merely for "the good of the local."

The technique of enforcement in racketeering is familiar—personal violence including murder, destruction of goods and premises, kidnaping, bombings and incendiary fires. The methods employed by the Black Hand have been accepted and modernized. The use of bombs is alarmingly great; according to one estimate, in Chicago from the period from January 1, 1928, to October 1, 1932, 500 bombs had been planted, resulting in more than \$1,000,000 damage. By underworld gossip there are set scales of fee: for bombing; the Illinois Crime Survey in 1929 reported an interlocking system for bombing in different fields and in the case of one bombing crew in Chicago the fees were actually revealed.

Although gangs are employed for special acts of violence, including professional killings, the racket itself must be distinguished from the old fashioned gang. Even the terminology of the underworld makes the distinction: a group of racketeers is called a mob rather than a gang. The older racketeers were in many instances former members of old neighborhood gangs. But the earlier gangs were much larger than the mob; some of the famous neighborhood gangs of New York and Chicago mustered hundreds and even thousands of adherents. The modern racket is generally smaller for a number of reasons. Since it exerts pressure where resistance is weakest, it does not need mass demonstration of strength: its power is not often challenged. The code does not require that a victim be met face to face, any more than a legally condemned prisoner is expected to seek vindication by ordeal of battle; there is greater safety from the police in smaller and more trusted numbers. An exception of a limited kind applies to the beer and liquor rackets. In these the syndicate managers and "front men" have been comparatively few but the employees of the racket, if truck drivers, brewers and salesmen are included, are many. In some of the rackets there are hangers on who render important service without sharing in management.

The modern racket as distinguished from the

gang is scarcely a neighborhood affair, for the territories covered are much larger; and with few exceptions (notably in specialized rackets) the members of the racket do not seem to be racially homogeneous. In the type of racket, however, which preys largely upon businesses owned by a particular ethnic group, the racketeers are themselves almost exclusively of the same group. Examples are found in certain fresh vegetable rackets which prey largely upon Italians, in the kosher poultry racket directed against Jews and also in certain labor rackets aimed primarily at Irishmen.

The focal points of racketeering are the larger cities, where its interstitial growth is easiest. Chicago and New York City have held the limelight, but rackets are operated in other large cities as well. Detroit and Kansas City and Cleveland with its lugubrious "funeral racket" have been exposed as racketeering centers. The farmer too is often a victim of the racketeering, for his goods pay tribute as they come into the city. "Legs" Diamond, for example, operated a beer racket in a rural county of New York and in his sales arguments included some of the more refined forms of torture.

The general inactivity of police and prosecutors in the face of racketeering is unquestionably related to connections between politics and the underworld, although some part of the breakdown may be laid to inefficiency. The difficulties confronting honest and efficient law enforcement officers cannot be overlooked, for extortion is more difficult to prove than holdup, and witnesses are reluctant to testify because of fear, satisfaction with the racket or lack of confidence in police and district attorney; in order to secure convictions of racket leaders great energy and a persistent use of the John Doe grand jury investigation are required of the district attorney.

The connection between politicians and the underworld is old; in New York the alliance goes back at least to two decades before the Civil War. The use of gangs for election frauds and intimidation of voters, in return for which "protection" is given by politicians, has never ceased, particularly where elections and primaries are closely contested, as exposures in New York, Chicago and Cleveland have dramatically shown. But it is probably a mistake to attribute the rise of the racket in Chicago to intense political factionalism in that city or to assume that the alliance is disrupted when one political machine is firmly entrenched; racketeers contribute to

political campaigns directly, and also indirectly through distribution of foods to the poor of a neighborhood under the auspices of a district leader. Often the real appointing power, the district leader, is in politics for reasons of business, and mutually advantageous alliances are part of the game.

The relation between politics and racketeering, although difficult to prove, has been revealed in important instances. The Illinois Association for Criminal Justice reporting on the Municipal Court of Chicago found, for example, "a definitely established relationship between the underworld and some feudal lords." The Magistrates' courts inquiry in New York City exposed the common practise of intercession by district leaders on behalf of criminals and the acceptance of a large loan by a magistrate, later removed, from a notorious leader of the underworld. The murder of an assistant district attorney in Chicago, with its subsequent exposure of close connections between officialdom and racketeers, as well as the use by professional gamblers of district clubhouses in New York furnishes other striking evidences. Amazing too are the criminal records of notorious racketeers—discharge after discharge by the lower courts for "lack of evidence"—as are the astonishing "leaks" of information from the offices of prosecuting attorneys. But it is unlikely that all the political "fixing" is due to outright corruption of public officials. Some, as Moley has recorded, are "money honest but politically crooked." In the practise of this official immorality the release of no single criminal is considered a menace to society.

Political corruption was greatly stimulated by federal prohibition. The public conscience was softened by widespread opposition to the attempted regulation of personal habit, and large sums came into the hands of bootleggers. The step from political protection of an illegal traffic in liquor to protection for other crimes was but a short one. Many former gangs were absorbed into the beer and liquor rackets, as pre-prohibition criminal records disclose. The illegal nature of the enterprise itself compelled violence and murder. As the sanction of force became routine it was an easy transition to find subsidiary fields of action, as, for example, where the anti-trust laws barred legal attempts to combine. Because of a general disrespect for law the racket found its respectable partners in crime, business men, prepared for the partnership.

From the functional point of view the wholly parasitical racketeer must be distinguished from

the racketeer who performs a measure of service by acting as a stabilizing force in industry. The parasitical racketeer is big brother to the juvenile gangster, who in return for tribute refrains from stealing from the pushcarts and stores of the neighborhood, and whose services are valuable merely to the extent of the self-restraint he exercises. His contemporary counterpart injects himself into the economic scene in the same fashion but on a larger scale. Choosing a weak spot in the industrial structure he proceeds to occupy the point of vantage to his own profit. His operations are most likely to begin where the victims are of foreign origin and ignorant of the laws and where small capital is required. Fruit dealers, cleaners and dyers, truckmen, fish, vegetable and fresh poultry dealers, are the most likely subjects for exploitation. The field is more fertile when the supply of the product is relatively small and easy to monopolize or where the time element is essential to the victim, as in the "shakedown" of building contractors working under heavy contractual penalties for delay or as in "loading" and trucking rackets, where the movement of perishable foodstuffs is essential to prevent decay.

The racketeer as a type is a natural evolutionary product of strict *laissez faire*. Society lays no restriction upon the number of middlemen who may enter a field. There is no challenge to the middleman to prove his economic usefulness; no certificate of convenience and necessity is asked or given. The parasitical racketeer, no more or less useful than many jobbers and wholesalers, personifies economic individualism in its farthest reach. He grows in a porous economic organization, giving no reason for his being except that he is a seeker after gain. For the ethics current during the era of prosperity that was almost excuse enough. The American scene, in broad perspective, showed tolerance toward the acquisition of riches at the expense of moral restriction. In an era of unrestrained competition the touchstone of morality was success. The pegged market in stocks, the manipulation of subsidiary companies, the reckless puffing of securities, the taking by corporate managements of inordinately large bonuses, the rather widespread evasion of taxes, the easy connivance of politicians in grabs—are a few illustrations of the temper of the times which furnish a key to the parasitical racketeer.

The attitude of the typical victim is not unrelated. Even though the motive of fear is primary, there is often the feeling too that when the

tribute can be passed on to the consumer the extortion is not inherently wrong. Some long for freedom of action, but many covertly approve methods that bring greater stability to their own businesses. Certain commission merchants, for example, have admitted that selling directly to a racket monopoly instead of to many retailers is a boon because it eliminates many detailed bookkeeping entries.

On the other hand, the stabilizing racketeer, while he is in purpose and method a criminal, is in function perhaps an illegal police force. He is more powerful than injunctions and suits for damages; he executes the mandates of his associates with dispatch and by direct methods. These associates are legitimate business men, and the racketeer's problem is often a sensible limitation of production. His methods, however, are violent, and the power he wields is uncontrolled, for he has no concern with the tests by which his victims are selected. This alliance between business and the underworld is attributable in substantial respects to the antitrust laws; yet the entire burden cannot be made to fall upon these laws, for even if voluntary combination for price fixing were legal, the recalcitrant individualist would still be a problem for discipline and the cost to the consumer, perhaps, would remain equally high.

The racketeer sometimes called in to organize an association often remains to head it by intimidating his employers. With armed force at hand and with a reputation it is not difficult for him to find new spheres of influence. As the activities of the rackets are broadened, large sections of the community thus find themselves paying an unofficial sales tax to powerful lords of the underworld. A Capone is able to offer civic peace to Chicago through his own police methods, to protect a labor union against parasites and to break a powerful association racket by the prestige of his name.

An invisible government is set up, linked to the invisible government of the political machine. Its existence, like that of lynch law, is inimical to government, for the reservation of the exclusive use of force by the state is fundamental to an ordered political society. Sharing with the state the use of force the illegal organization also becomes a coordinate taxing agency, for it levies a tribute upon sales and services.

Estimates as to the cost of racketeering are little more than guesses. Many direct payments can never be determined; losses by extortion are not reported to the police as are thefts. The

indirect costs to the community in higher prices and association dues are difficult to assay, for the higher prices are sometimes partially compensated for by the saving of marginal entrepreneurs from costly bankruptcy or by the prevention of forced liquidations. Accurate comparison of average prices before and during the advent of the racketeer is a complicated task, since many other market factors may enter. Added elements of cost which must be considered of course are increased insurance rates for plate glass; arson, burglary and bombing risks; as well as the expense involved in added police protection and prosecuting expenses. The New York State Crime Commission in 1931 reported that racket costs to the nation were estimated to range between \$12,000,000,000 and \$18,000,000,000 annually, while the attorney general of the United States stated in 1933 that the national tribute to racketeers amounts to \$1,000,000,000 annually. As the Wickersham commission concluded, 'the data prerequisite to any estimate of racketeering losses are non-existent'.

In the face of the challenge of racketeering society must take action by direct police methods and perhaps by a reappraisal of legislation. The repeal of federal prohibition is already accomplished, and proposals to repeal the anti-gambling laws and to modify the rigors of the antitrust laws are being discussed. Public opinion must be made to feel that the dispensation of favors through political "pull" is vicious. The press and the bar must exert pressure for the appointment of able men to prosecutors' staffs and for the disbarment of lawyers who grow rich as advisers to the underworld.

While the problem of law enforcement as such is essentially a local matter, the federal prosecutions of racketeers are also important. The federal government has followed two principal methods, that which makes use of the income tax and that which relies upon the antitrust laws. A third method coming into increasing use is applicable where extortion is attempted through use of the mails. Violation of the antitrust laws is clearly subject for federal action since interstate commerce has been restrained; the mailing cases likewise are properly federal. But the use of the oblique attack of the income tax law has met with some criticism. The objection based upon constitutional demarcations in the field of criminal jurisdiction is, however, only theoretically applicable, for the complexities of modern conditions were not foreseen by the founders, and the tendency of Congress and the courts has

been toward an expanding view of the constitution in the designation of new federal substantive crimes. It is clear moreover that since the government is legally entitled to share in the profits from many forms of criminal endeavor, a separate crime—against the revenue—has actually been committed. Again, the danger that prosecutors will have too free a hand in the selection of defendants, although it is in theory disturbing, has in practise been found illusory for in most income tax prosecutions commission of other crimes—extortion, bribery and the conduct of illegal business—has in point of fact been incidentally proved.

Not only does the success of the federal prosecutions demonstrate the possibilities of action by local agencies when freed from political pressures, but the methods of federal investigation themselves should foreshadow the technique to be followed by local authorities. The tracing of criminal relationships by means of bank accounts, often under fictitious names, and the close scrutiny of corporate books are important features. The use of the John Doe grand jury investigation where crime is known to exist but where the racket leader is not yet definitely linked to any provable conspiracy is valuable. The application to duty which calls for the summoning of hundreds of witnesses from an industry, sometimes for merely informal preliminary conversation, points the only way in which the few good witnesses competent to prove cases of racketeering will be found.

Recent legislation has strengthened the federal attack on kidnaping and the powers of state officials to proceed against business racketeering. The immediate remedy, however, is to be sought not so much in new laws as in the selection of able enforcement officials, divorced from political pressure. The repeal of prohibition has already caused the liquor racketeer to turn to new fields; but adequate defense ought to come from a change in the public attitude toward law-breaking and from the pressure of lower standards of living, impelling political revolt against "unofficial sales taxes." A fearless and free officialdom is the preliminary answer to the challenge.

RAČKI, FRANJO (1828-94), Croatian historian, politician and nationalist leader. Rački was trained originally as a Catholic theologian and professor of theology. His three-year stay in Rome (1857-60), during which he devoted himself to studies in palaeography and diplomacy and gathered historical source materials from various archives, provided him with a scientific and methodological equipment for his historiographical work. After his return to Croatia he dedicated the rest of his life to the Croatian national movement as scientist, national mentor and aid to Bishop Strossmayer in the organization and upbuilding of Croatian scientific institutions. An active politician and political publicist, he took a leading part in the creation and propagation of a national and cultural South Slav program and in the investigation of Croatian and South Slav history. His political and historical articles exerted a far reaching and fundamental influence on Croatian national political thought and movements. Rački was a prominent member of the Croatian diet from 1861 and a Croatian representative in the Hungarian parliament from 1865, participating in the discussions of all the important constitutional and national problems. Politically, he favored an autonomous Croatia with a unified administration within a federal Austrian mon-

archy. He considered it a historical and natural necessity to unite the Serbs and Croats and, in a broader sense, all the South Slavs including also the Slovenes and the Bulgarians. Rački thus became the most prominent apostle and formulator of the South Slav idea and he cultivated the intellectual ground for the subsequent Yugoslav political union. His thorough acquaintance with the national and historical development of the South Slavs and his accurate knowledge of the differentiating and unifying forces and tendencies in this process of development provided him with a solid foundation for his political views and were responsible for his enormous influence. As a scientific historian, political publicist and organizer he represented the view that national and political unity could be brought about only through consciousness of a common national culture, a common South Slav literary language and a literature and learning with a South Slav orientation. This consciousness of a common culture, he held, would overcome all the difficulties and contradictions which had arisen as a result of different historico-political development, religious divergences and alien Romanic, German and Byzantine-oriental influences. Rački worked unceasingly in this spirit as the first president of the Yugoslav Academy of Sciences and Arts, founded in 1866. His nationalism represented a peculiar combination of Croatian patriotism and South Slav pan-Slavism. As a historian he was conscientious and critical, familiar with the sources and the auxiliary sciences. He was the author of numerous fundamental studies and edited historical source materials from various archives, particularly the Vatican. His special field of research was the period of the national Croatian dynasty (ninth to eleventh century) and the general political, social and cultural history of the South Slavs during the Middle Ages. Through his investigations and source editions in the *Monumenta* of the academy he laid the foundations for the study of older Croatian and South Slav history and made available to European scholarship the older history of the South Slavs.

ies, *Résumés des communications* . . . (Warsaw 1933) pt. ii, p. 222-27; Fischel, A., *Der Panславismus bis zum Weltkrieg* (Stuttgart 1919).

RADIĆ, STIJEPA (1871-1928), Croatian nationalist and agrarian reformer. Radić succeeded in obtaining an education, despite great financial difficulties, at Zagreb, Prague and at the École des Sciences Politiques in Paris. His political activities fall into well defined periods: as a student he took an important part in the youth movement which aimed at a South Slav union; from 1902 he was the secretary and the chief propagandist of the Croatian opposition parties; in 1904 he organized the Croatian Peasant party, which after the World War became the dominant party in Croatia, and was its leader until his death. During the thirty years in which he was one of the outstanding personalities in South Slav politics he endured imprisonment, exile and incessant persecution, first from Magyars and later from the pro-Serb group in Yugoslavia. But he never ceased his work of organizing the Croatian peasantry and his propaganda for their cause and for Croatian nationalism; his devotion made him the peasants' idol.

Influenced by contact with western capitalistic individualism and by western ideology, especially by the writings of Tolstoy and the French democrats, and in nationalist doctrine by Rački and Masaryk, Radić was nevertheless deeply rooted in the patriarchal family, village economy and culture of his homeland; his doctrines reflect this dual background. His aim was a peaceful state in which the dominant or rather the controlling influence would be the peasantry. His program called for a struggle by legal means for the emancipation of Croatia, which Radić pointed out was conditioned by the spiritual awakening and strengthening of its agricultural population. These ends would be achieved by education, by raising the general cultural, and especially the economic level of the people. Tending more toward messianism than toward the rational and systematic, Radić saw the complete regeneration of mankind in a new social order based on the peasant family homestead as an economic and cultural unit. The number of such homesteads must be increased and improved by the break up of large landed estates and the abolition of sale for debt of peasant farms and all their appurtenances. As a pacifist he opposed the idea of the class struggle as well as national and imperialistic wars.

The program of Radić's Peasant party is contained in his pamphlets, *Najjača stranka u*

hrvatskoj (Founding of a Croatian party, Zagreb 1902) and the post-war *Put k seljačkoj republici* (Zagreb 1921; tr. into German as *Grundlehre oder Programm der kroatischen republikanischen Bauern-Partei*, Zagreb 1923), which adapted the earlier program to changed conditions. Before the World War Radić advocated not a dual but a triune system for Austria-Hungary, in which Croatia would be the third state. After the formation of Yugoslavia he insisted that historical conditions required its decentralization and that it should be transformed into a democratic federate republic with various instruments of popular control, such as the referendum. Except in 1925, when Radić was minister of education, and for a short time thereafter, the parliamentary group of the Croatian Peasant party (*Hrvatska seljačka stranka*) under his direction either abstained from participation in the government or formed an effective opposition bloc.

A pioneer of the subsequently powerful "green international," Radić developed the peasant movement in Croatia and formulated its ideology. He broke the economic and spiritual domination of the city over the country and brought the peasantry to its important role in the nationalist movement, which had previously been supported and controlled exclusively by the urban intelligentsia.

Radić was a prolific journalist, and the historical significance of his work has not yet been fully appraised. His social and economic ideas are to be found especially in *Hrvatska misao* (Croatian thought). He was the author of a number of books, including *La Croatie actuelle et les Slaves du Sud* (Paris 1899), *Moderna kolonizacija i Slaveni* (Modern colonization and the Slavs, Zagreb 1904) and *Suvremena Evropa* (Contemporary Europe, Zagreb 1905).

RADICALISM is currently conceived as a complex sentiment with three major components. Of these, the first and perhaps most basic is a conspicuously stressed attitude or frame of mind toward one particular institution of society or toward the social order as a whole

An individual may be a radical with respect to religion but not with respect to art; with respect to science but not with respect to religion or the economic establishment; with respect to politics but not with respect to sex; with respect to the economic establishment but not with respect to the family. Conversely a person's radicalism may envisage the entire complex of a society or a culture, and apply to each and every one of its component institutions; and it is observable that radical attitudes toward any one institution tend to expand in scope until their field is coincident with the entire setup of a society.

Attitudes are identified as radical when their prevailing emotional tone is one of moral indignation, often rising through anger to hatred for some existing and powerful institutional arrangement which is evaluated as in principle and practise untrue, unbeautiful, unfair, unjust, exploitative, and the like. This emotion tends to express itself in a specialized and appropriate vocabulary which, figuring in the mind of the radical as an objective designation of what he hates, operates in fact as a dialect of value-judgments whose every term carries moral condemnation. Examples of such dialects may be observed in the special vocabularies derived from Karl Marx or from Henry George or from Thorstein Veblen.

The second major component of radicalism is a distinct philosophy and program of social change looking toward systematic destruction of what is hated, and its replacement by an art, a faith, a science or a society logically demonstrated as true and good and beautiful and just, or at least more so than the condemned establishment or society.

Finally, radicalism tends to define its aims and methods in democratic and humanitarian terms. Its indignation is directed against the classes in behalf of the masses, against the privileged in behalf of the unprivileged, against owners in behalf of the propertyless. It favors the many over the one.

In the nature of things, the more conspicuous of the three components are the emotional tone and its vocabulary of misprision and assault. These spread by a kind of induction that attracts people to the radical cause when they themselves feel grievances which are by it rationalized and socialized and that repels them into a counter-anger and hatred if they feel that it assaults their persons, their privileges, their interests or their possessions. For this reason usage tends to make "dangerous," "subversive," "irrespon-

sible" constant companions of radicalism and radical.

These connotations of the terms were not their first. They are comparatively recent developments, and have spread most markedly since the World War. Radical and its derivatives came into effective use in the eighteenth century, coincidentally with the spread of democratic ideas. Lecky says that English radicalism was born with the attempt to reform Parliament in 1769 and to make the members "habitually subservient to their constituents." A quarter of a century later, James Fox, aiming at this same, still unattained goal, spoke of the necessity of "radical reform." But it was in the years between the end of the Napoleonic wars and the adoption of the First Reform Bill that the term came into widespread use in England as the designation of a specific attitude, especially in politics. In the course of time a European consensus became manifest concerning the import of radicalism. Herbert Spencer described it in his *Social Statics* as endeavoring "to realize a state more in harmony with the character of the ideal man." It had attained a comparative identity of meaning in all lands where the humanitarian and democratic ideals of the pre-revolutionary French and English writers became the points of departure for principles and programs of social change. Thus, Bentham and his followers, whose views dominated the greater part of the Victorian era, are called the philosophical radicals. With their deep resentment of the inequities of society, their active sympathy for the oppressed and the poor, their enthusiasm for "the greatest good of the greatest number," and their demand that a political creed shall base itself on scientific knowledge of nature and human nature, the philosophical radicals provided the classical material for the idea of radicalism evinced by later generations. As this and that item of the Benthamite program was enacted and yet left its goal unattained, the "scientific" and doctrinal component of radicalism changed, without altering the emotional and the moral. Later, philosophical radicals were succeeded by scientific socialists. Today, in many quarters, radical is practically synonymous with socialistic or one of its many variants, such as syndicalist, communist, Bolshevik, and the same animus attaches indifferently to all.

Radical is the bad name which opponents of any plan of social change give to it with a view to defeating it. Intrinsically a plan may propose no more drastic and extensive a change when it is

called radical than when it is called conservative. Thus, Fascism in Italy, Hitlerism in Germany and Leninism in Russia involve no less far reaching alterations of polity in one case than in the others. All three alike were animated by intense hatreds for the regimes they overthrew, and each proclaimed social salvation to be exclusively the consequence of the regime it set up. Yet usage would reject radical as an altogether inappropriate description of Mussolini or of Hitler, and would accept it as quite suitable to Lenin and his followers. There were those who called William Jennings Bryan radical, and to whom Theodore Roosevelt was reactionary. An influential class of Americans—financiers and industrialists—are reported to consider as radical the modifications of the industrial and financial structure of the United States which were initiated by law in 1933. A less influential but more numerous class—progressives and socialists—find them conservative. The thread of continuity amid all this variation of meaning is the common recognition among the different evaluators that radicalism is intrinsically constituted by its humanitarian and democratic intent. When a program or an ideology is called radical by one group and conservative by another, the first sees it as an instrument for the liberation and improvement of the lives of the masses, the other as a hypocritical or insufficient instrument. How a measure or a man is to be designated depends on who does it and from what position. The difference is one of purpose and perspective.

Considerations of this order suggest that in themselves plans of social change are no more radical or conservative than locomotives are capitalist or wheat is communist. A radical intent accrues to any plan of economic or political reconstruction if it is directed toward the distributive freedom and well being of men. With a simple alteration in the incidence and distribution of power from the few to the many, the corporative state of Mussolini and his dogmatists and the totalitarian state of Hitler and his confabulators could be as radical as the socialist state of Stalin and his planners. In point of fact, the actual democratic incidence and distribution of power are not needed. As the situation in Soviet Russia amply proves, the belief and the hope that they will take place are enough to command the eulogium, or opprobrium, of radicalism.

As to the passional component of radicalism, it is no more pronounced or intense than in

conservatism. But events since the World War have rendered it more conspicuous, and the convention of the times has apportioned to it, falsely, the more significant role among the components of the sentiment of radicalism. As a result of the insurgence of the Freudian psychology at a period when, because of the Russian Revolution, radicalism was in the air of many lands, the sentiment was made a theme of psychological and pseudo-psychological inquiry. It was studied by means of questionnaires, intelligence tests, rating scales and the other implements of post-war psychology. Some investigators found radicals to be repressed people whose blocked impulses turned back on themselves, taking the form of anger and pugnacity, which then flowed outward against the characteristic obstructions to freedom and happiness in the social order. Economic security, a happy marriage, a hobby, were declared often to deradicalize the radical so made. Other investigators, using other methods, revealed that radicals have a quicker reaction time than conservatives; that they are not so set in their ways and break habits more readily; that they are more self-conscious, more retiring, more sensitive and more humane than conservatives; that they are less amenable to contagion from majority opinion; that they have a higher intelligence quotient. Still others found them to be neurotic, envious, anti-social and the like, and in need of treatment as cases for mental hygiene. Whether these psychological discoveries are facts or fictions is irrelevant. They are vitiated from the point of view of social science in that they are attributed to a type of personality, attitude and behavior conditioned by the fact that it is in a combative situation, and that its manifest qualities are functions of this situation.

In terms of the processes of social change, the frame and attitude of mind called radicalism is a phase which develops out of liberalism in consequence of successful obstruction to the graduated changings of the past in which liberalism consists and which it carries on. This obstruction intensifies liberal resistance. It ends by generating a powerful antagonism which culminates in a break with the past in both feeling and plan. Radicalism in the current sense of the word originates at the breaking point. If the successful obstruction to the radical program persists, radicalism becomes indistinguishable from intransigence (*q.v.*). The blocked emotions and energies of the radicals are redirected, and take form as verbalizations. They develop

elaborate dialectics of social change, sometimes of astounding ingenuity. These dialectics become "systems" and constitute the deposit of faith of a cult. Such cults have been described, in the racy expression of the late Theodore Roosevelt, as "the lunatic fringe" of the radical movements. Their adherents are as a rule not numerous, and are far more eager to make converts than to win power. They are marked by a tendency to gravitate into the orbit of other movements, as the Single Taxers and so many others gravitated into the Bull Moose movement in the United States in 1912. It is in this regard that they distinguish themselves from another species of the genus radical, which may be called revolutionary. The revolutionary movement tends to retain its autonomy and to seek power in order to set up the changes it contemplates. Although blocked, in the long run it

functions, in common with all radicalisms, as a point of reference, if not a gradient, for the direction and pattern of social change. The history since 1870 of the socialisms, orthodox, heterodox, true and perverse, in various parts of the world, provides a rich example of the rule. Bismarck drew upon socialism at least as much as Ramsay MacDonald. Fascism, Nazism, proposals of "planned economies" in the United States, revolutionary programs in Mexico, China, Spain, Japan—all exhibit components drawn from the socialist ideology, their sponsors believing themselves to gain strength from the radical contamination.

HISTORY AND ECONOMIC ORGANIZATION.....	HOWARD T. LEWIS
CULTURAL ASPECTS.....	WILLIAM A. ORTON
LEGAL ASPECTS	HARRY SHULMAN

HISTORY AND ECONOMIC ORGANIZATION. The radio industry embraces the manufacture of transmitting and receiving apparatus, the broadcasting of programs and the transmission of messages. The three branches are not only interdependent but frequently interlocked under common corporate control by means of holding companies and similar devices. The radio industry has not the same direct economic importance as other great industries, but it transcends them by its significance as a means of entertainment and communication.

In 1896 Guglielmo Marconi, utilizing the scientific work of Hertz, Branly, Lodge and others, secured in Great Britain a patent for wireless telegraph circuits and apparatus. He realized from the outset that the future of radio depended upon its being endowed with commercial value. Because his experiments had demonstrated the possibility of transmitting messages by wireless telegraphy between ships at sea and the shore, there was organized in Great Britain, on July 29, 1897, the Wireless Telegraph and Signal Company (subsequently Marconi's Wireless Telegraph Company, Ltd.), which acquired the title to all Marconi's patents throughout the world except in Italy and its dependencies. In the same year the first Marconi station was established on the Isle of Wight and the Marconi system was adopted by the Italian

navy. Two years later the British Admiralty installed the system on 32 warships and war stations, and a French gunboat was equipped with wireless. In 1900 the first German commercial wireless station was opened on Borkum Island; in the next year Marconi spanned the Atlantic Ocean from Cornwall, England, to Newfoundland. The value, both commercial and military, of wireless telegraphy was promptly recognized and utilized.

Developments in the United States did not lag far behind. The Marconi Wireless Telegraph Company of America, a subsidiary of the British company, was formed on November 22, 1899. The British interests realized from the beginning that the commercial development of wireless telegraphy was dependent upon adequate and strategically located shore stations quite as much as upon well equipped ships. The American Marconi Company erected and operated 60 land stations, including a high power station on Cape Cod capable of transmitting messages to ships at sea over a distance of 2000 miles. Until 1912, however, it did not operate any high power stations for the transmission of transoceanic messages.

Meanwhile a complicated patent situation had arisen, involving a struggle of rival corporate interests. American inventors were actively at work. By 1908 Lee De Forest had secured a

number of patents covering a three-element tube by adding the grid to the filament and plate already covered by an earlier patent of J. Ambrose Fleming. Following a court action brought by American Marconi in 1917, which successfully alleged infringements of the Fleming patent it had acquired, De Forest sold his rights to the American Telephone and Telegraph Company, which could use them in long distance telephone communication without infringing on the Fleming radio patent. The De Forest interests confined themselves to the manufacture and sale of various component parts used in assembling radio sets. The Marconi Company was unable to manufacture three-element tubes and could get them only through the Western Electric Company, a subsidiary of American Telephone and Telegraph. The United Fruit Company also had secured important radio patents of its own and the right to use others from the Marconi Company; in 1912 it acquired the Wireless Specialty Apparatus Company, the principal manufacturer of crystal receiving sets, and in 1913 established the Tropical Radio Telegraph Company as a subsidiary to conduct its radio operations. The situation was further complicated by the fact that the Federal Telegraph Company owned the important Pederson and Poulsen patents. Thus a considerable number of inventions covered by patents of great value to radio were controlled by opposing interests which refused to license one another. Some improvement was effected during the World War when the United States government persuaded the concerns involved to disregard patent rights in so far as governmental requirements were concerned, in return for a guaranty of protection against infringement suits.

Another factor entered the situation. The British Marconi Company had spread its interests all over the world by means of subsidiaries and interlocking directorates. This quasi-monopoly was threatened by an American invention. The American Marconi Company had not been able to render reliable transatlantic radio service because of faulty apparatus at both transmitting and receiving stations. E. F. W. Alexanderson of the General Electric Research Laboratory succeeded in building a high frequency alternator which corrected some of these defects. The value of this improvement was recognized immediately by the British Marconi Company, and in 1917 it tried to secure exclusive rights to the machine. Although unsuccessful at the time, British Marconi in 1919 again

sent its representatives to the United States to negotiate with General Electric for the exclusive rights to the Alexanderson alternator and its accessories in exchange for \$5,000,000 worth of contracts with General Electric. The negotiations were virtually concluded when Rear Admiral Bullard of the United States Navy approached the General Electric Company, stating that the value of the Alexanderson alternator and its accessories in rendering reliable transoceanic radio service had been demonstrated; that it was without doubt the best system in existence; and that if the General Electric Company sold these rights to British Marconi, it would be possible for British interests, in view of their domination of the cable situation, to obtain a monopoly of world wide communications for an indefinite period. Negotiations were dropped and General Electric found itself without an outlet for the invention in which it had made a heavy investment. Under Bullard's guidance a plan was evolved by which a new company was to be organized, controlled entirely by American capital. The first step consisted of the purchase of the block of stock owned by British Marconi in its American subsidiary. In 1919 the General Electric Company was instrumental in the organization, under the laws of the state of Delaware, of the company known as the Radio Corporation of America.

The new company purchased all the patents, goodwill and physical assets of the American Marconi Company and then entered into an agreement with General Electric, whereby the two companies exchanged rights to use each other's patents and agreed to sell exclusively to each other the radio apparatus which they made under these patents. As a result Radio Corporation obtained control of practically every high power station in the United States together with a number of important radio patents. Further control over patents was secured in 1920, when an agreement was reached between General Electric, Radio Corporation, Western Electric and American Telephone and Telegraph to allow one another the right to use all of the radio patents belonging to each company. A similar arrangement was made by the Radio Corporation with the United Fruit Company in 1921. In the same year the new company acquired the radio interests of the Westinghouse Electric and Manufacturing Company. The International Radio Telegraph Company, controlled by Westinghouse, sold to the Radio Cor-

poration its patents which applied to the manufacture of practically all receiving apparatus using vacuum tubes, and Westinghouse agreed to manufacture apparatus exclusively for the Radio Corporation.

The development of broadcasting opened a new period in the history of radio. Although as far back as 1907 De Forest had equipped a number of vessels with radio-telephonic apparatus, it remained for the Westinghouse Company on November 20, 1920, to put into operation the first permanent radio broadcasting station. At the beginning of the new period the radio companies were of two types: those interested primarily in radio, such as the De Forest company and the Radio Corporation; and those concerned chiefly with outside interests and only incidentally with radio, such as Westinghouse, General Electric and several others. These firms, all operating before 1922, had an average capitalization of \$6,000,000 and followed conservative policies, their only problem being one of expanding production. By 1921 a radio boom was in full swing; many new interests were attracted by what they believed to be opportunities for big and rapid profits. New companies sprang up overnight, with an average capitalization of only \$950,000. In the month of April, 1922, the state of New York chartered 56 companies whose business in one way or another was to be concerned with radio and whose capitalization averaged \$31,500. The output and sales of radio receiving sets increased tremendously (see accompanying table). The increase in sales

did not, however, meet the claims made by the manufacturers.

The result of the boom was overexpansion and excess capacity, whose costs kept down profits and in many cases turned them into losses. Competition was intensified in spite of the increasing public demand for sets. The capacity of two or three companies was more than enough to meet the existing demand. During the period from 1919 to 1925 the number of companies increased very rapidly and, while the earnings of the radio industry as a whole increased, the average earnings of individual companies from radio sales dropped noticeably. The boom collapsed in 1925-26, preparing the conditions for a general stabilization of the radio industry. Of the 188 companies existing in 1925 only 73 were doing business in 1926, a drop of 61 percent in one year through failure or withdrawal; only 26 of these companies existed in 1932. Of 40 firms reporting in 1925, 6 failed (15 percent); of 43 in 1926, 4 failed (9 percent); of 44 in 1927, 3 failed (7 percent.) The figure for failures in all manufacturing industries has never deviated far from 1 percent. This collapse of 1926 also affected radio stock values, which had been rising. In 1924 there were 12 stocks listed for trading at a boom value of \$147,041,634; in 1926 the value was \$58,678,456, a net loss of 60 percent. There was a noticeable effect on corporate earnings. For 1925, 32 companies reported average earnings of \$536,142; in 1926, 28 reported an average of \$553,196; in 1927, 28 reported an average of \$589,049. Earnings rose very slowly because of the basic changes which were taking place in the structure of the industry. The personnel of the industry was shifting rapidly; new companies were formed and old companies were liquidated. Of those which withdrew during 1925-27 the average capitalization was only \$700,000; of those which were set up during 1926-27 the average was \$1,500,000.

Throughout this period the Radio Corporation of America extended its control over the industry, in spite of the complaints of the smaller producers against the "Radio Trust." By 1930 the Radio Corporation was a dominant factor in communication, manufacturing and broadcasting. RCA Communications, Inc., engaged in the handling of international communications, while the Radio Marine Corporation specialized in ship to shore and airplane business. RCA Victor, Inc., produced radio cabinets and phonograph records and absorbed RCA Photophone, Inc., while RCA Radiotron, Inc.,

ANNUAL RADIO SALES, UNITED STATES, 1920-31

YEAR	SALES
1920	\$ 2,000,000
1921	5,000,000
1922	60,000,000
1923	136,000,000
1924	358,000,000
1925	430,000,000
1926	506,000,000
1927	425,000,000
1928	650,550,000
1929	842,548,000
1930	500,931,500
1931	309,270,000

See Market Data Book, for 1928, 1929, 1931 and 1931

from 1921 to 1922 amounted to 1100 percent; from 1922 to 1923, 127 percent; and from 1923 to 1924, 163 percent. Total sales rose from \$2,000,000 in 1920 to \$358,000,000 in 1924 and \$842,548,000 in 1929. The majority of sets placed on the market during this boom period

manufactured radio tubes and has since absorbed the Cunningham Tube Manufacturing Company. The Radio Corporation has full ownership of the National Broadcasting Company. In addition the Radio Corporation is interested in the development of television through its control of Radio-Keith-Orpheum Corporation. The company also has a 27 percent stock interest in Electric and Musical Industries, Inc., which is a merger of the Columbia Graphophone Company, Inc., and the Gramophone Company, Ltd. In the speculative boom which collapsed in October, 1929, Radio Corporation stock rose to fantastic heights.

As a result of the prosecution of the Radio Corporation under the antitrust law a consent decree was signed on November 21, 1932, by virtue of which General Electric, Westinghouse, American Telephone and Telegraph and certain other companies were required to divest themselves of all stock interest in the Radio Corporation. The latter company retained the right to grant licenses to manufacturers whether of its own patents or of those acquired under the patent pool. It is obligated, however, to grant licenses to all applicants and this under the same terms and conditions. In addition the Radio Corporation is permitted to license, manufacture and sell the transmitters and transmission tubes, which it was formerly obligated to buy from either General Electric or Westinghouse. It is permitted to go into the business of manufacturing and selling radio sets with the Radio Corporation licenses and to operate outside the radio field.

In the ten-year period 1920-29 radio became definitely an industry of first magnitude. Estimates indicate that in 1930 the industry employed about 110,000 wageworkers. Labor conditions are about the same as in other branches of the electrical industry, except that a larger number of women are employed, and the work is highly seasonal. Experience during 1926-29 has indicated that employment is more unstable in the manufacture of radio sets than in the vacuum tube factories; in the former from one third to two fifths of the workers employed at the peak of production in summer and early fall were retained in the recurring spring "depression," and in the latter about one half. There are no unions in the industry.

Of the total radio output of \$463,109,235 in 1929 (20.1 percent of the whole output of electrical manufacturing) \$381,096,428 represented the value of radio apparatus, of which \$253,260,-

052 accounted for receiving sets and \$82,012,807 (17.71 percent) for radio tubes. In 87 manufacturing plants, specializing in the production of radio receiving sets to the extent of 90 percent or more of their business, the selling value of their products was 63.6 percent of the total value of all receiving sets produced in 1929. Of the total distributed sales made by these 87 manufacturers 80.2 percent was transacted through wholesalers, 7.3 percent was direct to industrial consumers, 6.8 percent was direct to retailers and 5.3 percent was through wholesale outlets owned by manufacturers. Of \$47,928,000 of sales made by manufacturers of radio tubes in that year 55.9 percent was through wholesalers and 31.8 percent through manufacturers' wholesale outlets. This surprisingly large distribution of tubes through manufacturers' wholesale branches, as contrasted with receiving sets, is perhaps explained by the fact that radio tubes are now produced by large scale electric lamp manufacturers, who have utilized the wholesale branches originally established because of the need for special care in testing and handling their fragile product.

Other figures are equally significant. It was estimated that, in 1932, 16,125,000 families in the United States owned receiving sets, out of a world total estimated at 20,000,000. If an average sized family of 3.3 persons is assumed, over 50,000,000 people were presumably reached by this means of communication. On June 30, 1933, there were 598 American broadcasting stations. The Federal Radio Commission in 1931 estimated the gross receipts of broadcasting stations and networks as approximately \$77,758,000. From 1927 through 1932 the sums expended for time alone and only over the two great national networks increased each year over the preceding year; the figure had risen to \$39,106,766 by 1932. A reliable estimate placed the total investment of the radio industry in plant facilities for manufacturing, distributing and broadcasting at \$175,000,000 in 1932; other estimates are even higher.

Radio services can be grouped roughly into two major divisions: commercial communications and broadcasting. Within the former division particular mention may be made of fixed, maritime, police and aviation services. The fixed services relate to radiotelegraphy and radiotelephony. They include the transmission not only of messages but also of photographs, documents and the like. In 1933 there were in the United States 310 point to point telegraph sta-

tions at 28 locations and 34 point to point telephone stations at 6 locations, which were licensed by the Federal Radio Commission to render fixed public service, including press, over international circuits; the stations were operated by 11 companies. Communication between the United States and 53 foreign countries was possible by radiotelephone stations and wire line extensions which provided facilities for the interconnection of 92 percent of the telephones of the world.

The maritime services are those established between ships and shore stations or between vessels. On June 30, 1933, there were 1997 ship stations licensed by the Federal Radio Commission on vessels of American registry. The use of radio by police departments has grown steadily since its establishment by Detroit in 1927. In four states—Michigan, Pennsylvania, Iowa and Massachusetts—a state police radio service is maintained. On June 30, 1933, there were 123 radio stations licensed for police use. The use of radio in aviation service is in no small measure responsible for the increased safety and reliability of air transportation.

After a period of rapid growth the number of broadcasting stations in the United States declined from a peak of 681 in 1927 to 598 in 1933. One reason for the decline is the Federal Radio Commission's policy of licensing only those stations which operate for "public convenience and necessity." Another reason is the high cost of installation and operation, a cost which poorly managed or poorly located stations have been unable to meet. On the other hand, the decline in the number of stations has been compensated by the improvement in their transmitting facilities and power. The individual station moreover has become of relatively less importance with the growth of regional and national networks. The first of these, the National Broadcasting Company, controlled by the Radio Corporation of America, was formed in 1926; the Columbia Broadcasting Company was organized two years later. Although the relationships existing between a chain and the individual stations vary considerably, in the main it may be said that the former pays each station for the use of its facilities for purposes of commercial broadcasting and is in turn paid for sustaining programs for which the individual station contracts. Out of this relationship many problems arise. Most of them center around the amount of payment to be made by the one to the other and around the distribution or use of the hours during which

the station is in operation. Another important series of problems has developed as a result of the attempt on the part of the chains to secure the greatest possible advantage in the various competitive areas. This effort has resulted not only in a widely varying rate structure but also in a shifting of the stations from one network to another. In an effort to control the situation more effectively there has come about the inevitable trend toward ownership of individual stations by the chains, particularly in the more important receiving areas.

The broadcasting structure in the United States is dominated primarily by commercial motives. The stations are operated for profit, and the cost in the first instance is paid by a private business seeking to sell goods or service. Sustaining programs are provided for the time which is not sold for commercial purposes. Roughly 64 percent of broadcasting time is utilized by such programs. It is claimed that the average commercial program today is one fifth sales talk and four fifths entertainment. These facts help to explain the rise of the chains, since the national advertisers not only can afford to pay for chain service but also desire the maximum coverage for their investment.

The federal government operates no public broadcasting stations but exercises comprehensive regulation of broadcasting stations through the Federal Radio Commission, which was created in 1927. The commission consists of five members appointed by the president for a term of six years and has four divisions: legal, engineering, examiners and field operations. It has power to regulate the use of air channels, to assign wave lengths, to control the increase of facilities and the establishment of new stations and to determine engineering regulations governing the transmitting apparatus. It has practically no control over the programs presented (*see section on LEGAL ASPECTS*).

Radio is also regulated in all other countries, the tendency in Europe being toward stricter government control. In Great Britain broadcasting is a monopoly under control of the British Broadcasting Company, with a royal charter which is not transferable and may be revoked. Regulatory powers of a very stringent kind are vested in the postmaster general. The French government operates a chain of stations, while Japan operates its foreign radio communication system. In most European and in some Latin American countries broadcasting is supported in large part by taxes; annual license fees are

imposed on receiving sets, ranging from five cents in France to eighteen dollars in San Salvador. In the Soviet Union the whole industry is under governmental control.

The international economic and political aspects of the radio industry are of marked significance. The Radio Corporation of America came into existence as a result of an effort to prevent British interests from gaining the same measure of control over world radio that they exercised over cable facilities. The contest between the United States, China and Japan over radio operation in China is indicative of the political and military importance attached to radio. A similar struggle has been going on in Latin America between American and British radio interests. As a result of the Imperial Communications Conference in 1928 Imperial and International Communications, Ltd., was formed to establish in the British Empire a system of wireless communications under joint control. Closely related to the political and military aspects are the commercial. Control of the instruments of international communication is in itself a valuable asset to all foreign commerce. Aside from this strategic advantage, however, there is a considerable volume of foreign trade in radio equipment, supplies and accessories. The export of radio equipment and supplies from the United States increased from \$8,794,453 in 1926 to approximately \$23,000,000 in 1929, 1930 and 1931 but declined to \$13,312,166 in 1932. Of the total exports in 1932 only 5 percent of the dollar volume consisted of transmitting equipment, whereas receiving sets, tubes and accessories constituted 95 percent. Imports of radio apparatus into the United States have been negligible from the beginnings of the industry and since 1929 have declined steadily.

HOWARD T. LEWIS

CULTURAL ASPECTS. Broadcasting constitutes the cheapest, speediest and most ubiquitous mode of communication achieved by mankind. An instrument with immense educational and cultural possibilities, modern broadcasting is essentially a collective phenomenon, and its utilization has therefore presented new problems to the individualist creed of western capitalism. Yet in this matter as in others the United States has not worked out a body of thought or opinion adequate to control the results of modern science in their application to the collective life. The development of broadcasting was left primarily, although not without protests, to the

patent owners and the equipment manufacturers.

The original incentive to broadcasting was the obvious consideration that unless something was "on the air" the public would have no inducement to buy radio receiving sets. But as early as 1920 offers were being received and accepted from commercial concerns willing to supply program material in return for the chance to advertise. A rapidly growing source of revenue was thus discovered, and the hire of broadcasting facilities by advertisers became the financial mainstay and eventually the *raison d'être* of the vast majority of stations. The prospect of increasing advertising revenue by enlargement of the service area led to constant demands for higher power per station and to the development of interstation hook-ups. The latter culminated in the formation of chain or network systems, which by means of leased telephone wires and simultaneous rebroadcasting from a number of scattered stations could offer nation wide coverage, charging as much as \$15,000 per hour. The National Broadcasting Company was established to act, according to a statement of Merlin Aylesworth, its president, "as an indirect sales promotion agency for the radio manufacturing industry." The result has been that the cultural possibilities of radio have been limited by the pressure of business interests. No real use of radio is being made in the American school system. Rural areas are virtually neglected, except for broadcasting of government crop reports. In the cities the radio is mainly a substitute for the motion picture theater.

The Federal Radio Commission, established by the White Act in 1927, has taken the view that "advertising must be accepted for the present as the sole means of support for broadcasting." It has ruled moreover that "a broadcasting station engaged in general public service has ordinarily a claim to preference over a propaganda station," interpreting the term propaganda to include "every school of thought, religious, political, social and economic." The commission has no power over program content or sequence, save the authority to revoke a license in cases of obscenity or other obvious abuse. Regulation has always been strenuously combated by the broadcasters, who claim that their business is analogous to newspaper publishing in that the provision of non-commercial matter to the public is dependent on the advertising revenues. As a description of the existing

situation this analogy is on the whole correct.

American radio programs are of two kinds, as described in a report of the Radio Commission for 1932: "A commercial program is a program presented by the station for profit. It is sponsored usually by a person or corporation engaged in either wholesale or retail [sale] of merchandise with a view of gaining the good will of listeners and of making direct sales. The program content usually consists of either orchestra, song, drama, symphony, opera or variety, interspersed with sales talks or a description of the commodity advertised. A sustaining program is a program presented by the station without compensation and at its expense. Its purpose is twofold: (1) it serves as one method whereby the station can qualify under the public interest clause contained in its license and (2) it serves as a method by which the station seeks to enlarge and hold its audience and thereby increase the value of time available for commercial programs. The program content usually consists of either orchestra, song, drama, symphony, opera, variety, literature, science, politics, news, sports, or special events." A specimen survey at the close of 1931 showed that of 582 stations reporting, commercial programs accounted for 36.14 percent of broadcasting time. These furnish the sole source of revenue for the sustaining programs; any decline in advertising is therefore liable to affect the non-commercial service, much of which—symphony concerts, opera broadcasts, international news events and the like—is very expensive.

While the great majority of programs to which any cultural value can be assigned are of the sustaining character, certain advertisers have at times contributed musical, dramatic and semi-educational material of merit. Inasmuch, however, as the advertiser necessarily strives to reach the widest possible public, the cultural range of commercial programs is narrowly restricted. Furthermore local stations associated with the chains are under no obligation to rebroadcast sustaining programs and usually do not if they can sell such hours on their own account. With occasional exceptions stations use sustaining program material only in default of paid advertising, to which the more valuable evening hours primarily are devoted.

While the principal stations, especially those of the chain networks, have shown in recent years an increasing sense of public responsibility, criticism of the American system has likewise become more widespread and emphatic.

The prior claim of commercial interests on broadcasting time and facilities, recognized by the Federal Radio Commission, is resented by various groups, those concerned with education being the best organized. In the early years of broadcasting nearly 100 educational institutions established broadcasting stations, only 44 of which had survived by 1932. These were all of relatively low power and in many cases operated on restricted time. In terms of the composite units used by the commission for classification, they comprised less than 7 percent of all broadcasting facilities. While it is generally admitted that most of the original enterprises in this field were initiated too hastily, without adequate realization of the problems involved, educators in recent years have been vigorous in asserting their claim to more consideration. Conferences were held in 1929-30, from which two principal groups emerged. The first, organized as the National Committee on Education by Radio, and supported by the Association of Land-Grant Colleges and Universities, the National Education Association and other influential bodies, demands of Congress legislation for the exclusive reservation of not less than 15 percent of all broadcasting facilities for public and institutional educational agencies. This demand is strenuously opposed by commercial broadcasters. A second group, formed as a result of a study made by the American Association for Adult Education, became organized in 1930 as the National Advisory Council on Radio in Education, financed by Carnegie and Rockefeller funds. Since the National Broadcasting Company had proclaimed that broadcasters would be willing to donate time to educational purposes as soon as an authoritative body of educators could agree on matters of program and policy, the National Advisory Council set out to organize such a body and to draw up an experimental program. The chains then complied with their offer to donate time, with the result that since the fall of 1931 series of lectures have been broadcast over nation wide networks in economics, psychology, government and kindred fields. The lectures have been supplemented by reprints and pamphlet material made available at low cost through the University of Chicago Press. The policy of the National Advisory Council has been to cooperate with rather than to combat the dominant interests.

The Federal Radio Commission in 1932, in reply to a congressional inquiry, declared that "the present attitude of broadcasters . . . justi-

fies the Commission in believing that educational programs can be safely left to the voluntary gift of the use of facilities by commercial stations." It is doubtful, however, whether even if they were willing commercial broadcasters could afford to donate much more time than they do at present for an extension of the very limited educational facilities now offered. The costs are heavy, and in some cases the two national broadcasting systems have appealed for voluntary financial support for educational programs. The group favoring appropriative legislation holds that it is in principle undesirable for education to depend on the good will of commercial broadcasters or private advertisers. Under such circumstances, it is claimed, there can be no assurance that suitable material will be made available at the right time without risk of displacement by revenue yielding items; and several cases of such displacement lend color to this view. To date, however, the record of institutionally owned or operated radio stations is open to grave criticism. The distribution of broadcasting time by 71 institutions using radio is thus summarized in a 1933 report: entertainment, 44.6 percent; general information, 23.6; farm and home information, 20.4; formal instruction, 7.5; commercial programs, 3.9. It must be pointed out, however, that educationally owned stations are in danger of losing their licenses unless they operate full time, although there would seem to be no inherent necessity for this requirement beyond the attitude of the Radio Commission. The problem of financing further educational use of radio is also likely to become urgent, even if broadcasting time and facilities continue to be donated in sufficient measure. Yet, as a former member of the Radio Commission has pointed out, although American broadcasting is overwhelmingly commercial in aim, no payment has been asked of broadcasters for their license to use public channels.

Included in the activities classified by the broadcasters as educational are the dissemination of news and the discussion of political issues. About both these activities perplexing problems have arisen. The efforts of certain newspapers in 1928-30 to organize their own wireless service for news gathering purposes met with very serious obstruction from the principal patent owners in the industry. On the other hand, the practice of commercial broadcasters of using current news items as part of their program material has recently encountered serious opposition from the newspapers. In addition to

restricting the free space given to radio program announcements, on the ground that these are in the main advertising items which should be paid for as such, the associated newspapers adopted in April, 1933, a policy of stringent limitation in regard to the broadcasting of general news items, while the Associated Press has imposed on its members still more definite limitations as to the use by broadcasters of copyright news material—limitations which the courts appear willing to support.

The use of radio for political or governmental purposes is probably its most important social aspect. The extent of this use is indicated in part by the fact that in 1931 the two principal networks devoted 528 hours without compensation to speeches by national, state or city officials, the estimated commercial value of the time being approximately \$3,000,000. Since that year such use of radio has been rapidly on the increase, apart from the broadcasting paid for by political groups and parties in the campaign of 1932 and to a lesser extent continuously. It has been suggested that the type of leadership so developed may become to an undesirable degree emotional rather than rational. Safeguards would seem to lie, first, in the supplementary consideration of issues in the press and, second, in the impartial allotment of radio facilities to various schools of opinion. While cases of discrimination have not been lacking, American broadcasting cannot be attacked on this score more than other systems, particularly if the economic and strategic influence of the various schools seeking publicity is taken into account. It is of course inevitable, under a system of private ownership and commercial hire of facilities, that groups which can command large sums of money, directly or indirectly, have a basic advantage over less fortunate groups.

The most serious charge which may be advanced against the American system is concerned with the general cultural level of the great mass of broadcast material. That level is indicated in the dictum of the president of the National Broadcasting Company, uttered during a speech on education, that "in broadcasting we are dealing with a mass message, and the material delivered must be suitable for mass consumption." This conception of the mass, taken over from salesmanship, sets rigid limits to the possibilities of advance and experiment and disregards all minorities possessed of more than the most rudimentary intelligence or education in any of the special fields served by radio else-

where. It colors the musical, literary and educational efforts of the broadcasters, who fear that they may lose their public if they pay attention to the needs of groups whose cultural level is in any marked degree above the average. Among the latter dissatisfaction with American broadcasting is acute and increasing; but such groups are not numerous enough to exert economic pressure, which alone can evoke response from a commercial system. To the minority it appears that, no matter what steps in this direction be taken, there is an inherent contamination of literary, musical, educational, religious and all other material involved in the close association with commercial advertising. Since nearly all American broadcasting stations are profit seeking institutions, programs selected purely on their merits have necessarily a subordinate claim to programs selected for their advertising appeal. Further the competitive nature of the business has precluded the development, not only of any intelligent planning of radio offerings but even of any such general and classified description of them as would enable a listener to make an advance selection of the material now offered. There is, however, little prospect of improvement. There are no grounds for assurance that advertising revenues will increase in such measure as to permit much advance in either quality or quantity of the sustaining programs; nor does the evidence warrant the supposition that drastic curtailment of advertising would prove feasible financially. It is generally conceded that the prestige and popularity of American radio are on the decline. According to the best expert opinion there is no probability that television will come into commercial or general use in the near future to reanimate the radio industry; nor can such use be desirable culturally before some intelligent form of social control is devised.

In no other country does the conduct of broadcasting depend so completely on advertisement as in the United States. In England, the Soviet Union and Austria no advertising is permitted. Where it is allowed, as in France, Canada, Australia, Italy, Brazil, Mexico and Spain, it is under the supervision of some responsible authority and usually subject to limitation with regard to amount as well as to character. The British system constitutes the most thoroughgoing attempt to render broadcasting a public service of cultural value. It is financed from an annual license fee of ten shillings levied on each receiving set; a little over half of this revenue suffices to sustain all services, including

experimental work, the balance going into public funds. The publications of the British Broadcasting Corporation include three periodicals, in which commentaries, program notes, illustrations and other matter supplement the broadcasts. The proportion of jazz in program material is much lower, and special types of audience, those interested, for example, in modern poetry, music and literature, are regularly catered to. The conduct of the system is under constant criticism in both press and Parliament, but all parties have united in preferring it to any other. It has contributed not merely to the political and cultural education of the people but notably to the maintenance of orchestral music and the opera, which would otherwise have had to depend mainly, as in the United States, on the uncertain patronage of a wealthy minority. The recent decision of Canada to reconstruct its broadcasting system on a nationally owned and controlled basis, in which advertising shall be permitted under prescribed limitations as a contributory source of revenue, is of especial interest and significance, inasmuch as it follows four years of deliberation and a thorough experience of the commercial system.

Recent events in Europe have demonstrated that non-democratic governments can direct their radio facilities to partisan purposes, national and international, of very questionable character; but there is no assurance that in such circumstances privately owned systems would enjoy a special immunity from such subversion. This development is a step backward in comparison with the formation in 1930 of the International Broadcasting Union, representing 330 transmitting stations in 21 European countries; the members of the union have agreed to co-operate on programs and to abstain from propaganda against one another. The development of the collective life of democratic societies calls increasingly for publicly responsible bodies of a non-political character; and the association in the American mind—deliberately fostered by certain forces of public responsibility with political partisanship—constitutes perhaps the most formidable of the many obstacles to cultural advance.

WILLIAM A. ORTON

LEGAL ASPECTS. Legal development in the radio industry, more than in most others, is based on its peculiar technology. Notions of sovereignty, states' rights, property, laissez faire, developed by land and commercial economies,

are belied by the scientific facts of this novel method of communication.

The limited number of usable or dependable wave lengths available in the present state of the art, the inability to construct apparatus of sufficient selectivity to receive the desired wave and exclude all others, the resulting interference in reception by transmissions on the same or adjacent frequencies and the extensive geographic area of interferences, all combine to make *laissez faire* in radio communication impossible. All countries consequently control radio communication, either through government ownership of transmitting stations, as in Europe, or through government regulation of privately owned and operated stations, as in the United States.

Regulation began in the United States with the enactment of the federal Radio Act of 1912. Broadcasting was then unknown, and the act was passed primarily with reference to wireless telegraphy. It prohibited radio transmission without a license from the secretary of commerce and incorporated the regulations of the London International Radio Telegraph Convention of 1912. The secretary attempted to keep up with the developing use of radio and broadcasting by holding national radio conferences, promulgating detailed regulations, assigning frequencies to stations, refusing licenses which he thought should not be granted and specifying the time in which individual broadcasting stations could operate. Two decisions of lower federal courts and an opinion of the attorney general in 1926, holding that the secretary had no discretion to refuse licenses or to prohibit broadcasting on frequencies or at times not prohibited by the act, virtually ended his control. The resulting bedlam following the scramble for broadcasting and "wave jumping" led to the Radio Act of 1927.

It set up the Federal Radio Commission to bring order out of the chaos and, after one year, to act as an appellate body over the secretary of commerce, to whom the power of regulation was then to be restored. After continuing this temporary arrangement for two years, Congress finally made the commission a permanent body, to which the Radio Division of the Department of Commerce was transferred in 1932. The commission is empowered among other things to classify radio services, assign frequencies to the services and the individual stations, grant and revoke licenses for stations, determine their location, regulate the apparatus and power to be used by them, determine their time of operation,

make special regulations with respect to chain broadcasting and promulgate regulations to prevent interference. It is required to allocate broadcasting licenses, frequencies, station power and time as equally as possible among the five zones into which the country is divided and equitably among the states according to population. This restriction, frequently criticized as too rigid and out of harmony with scientific developments in radio, is an attempt to cope with the universally admitted need of equitable distribution of the scant facilities for broadcasting.

The fact that the service and interference areas of radio cannot be confined by state boundaries makes control by the individual states futile and requires either federal control or no radio communication at all. The necessary constitutional basis for this federal power was "found" therefore in the interstate commerce clause. Broadcasting is "the transmission of intelligence, ideas, and entertainment. It is intercourse and that intercourse is commerce," even though of a "new species" [United States v. American Bond and Mortgage Co., 31 F (2d) 448 (1929)]. Since it is also interstate, Congress has full power to regulate. In any event commercial point to point telegraphy or telephony is clearly interstate commerce. In order to permit the efficient use of radio for these purposes by the elimination of destructive interference Congress may and must incidentally regulate all broadcasting. It has been suggested also that since radio communication involves international agreements, federal regulatory authority may be based upon the power to make treaties and to provide the necessary and proper means for their observance. While no state has attempted to set up a complete system of regulation, statutes and municipal ordinances have imposed a variety of lesser regulations. Many of these have been impulsive and ill advised; others are reasonable local police or tax measures. In the working out of the necessary adjustments there is danger that constitutional logomachy may influence decisions beyond the requirements of the technological facts which have fashioned it. Thus a state tax upon the owners of receiving sets was invalidated by a lower federal court on the absurd ground that it was a direct burden upon interstate commerce, which is exclusively within the regulatory power of the federal government.

More difficult problems arise in the distribution of the limited number of available fre-

quencies among the numerous seekers. The Radio Act directs the commission to issue licenses when "public convenience, interest, or necessity will be served thereby." While this standard is hoary in the law of public utilities, little analogy can be found therein for radio. The possible types of radio service are comparatively unlimited. And each type has numerous supporters. The commission must determine therefore not simply whether a particular applicant will service the public convenience, interest or necessity, but whether he will do so above all other competing applicants. It must therefore make a choice of public policy as to the various types of services preferred: dance music, religious talks, political discussions and a host of variations. Furthermore in order to provide for desirable change or improvement care must be taken to guard the limited available facilities against complete appropriation by present users.

For this reason unique limitations have been imposed on the broadcaster's "property rights." The act recites that it is intended among other things "to provide for the use of such channels [of interstate and foreign radio communication], but not the ownership thereof, by individuals, firms or corporations, for limited periods of time, under licenses granted by Federal authority, and no such license shall be construed to create any right, beyond the terms, conditions, and periods of the license." Out of abundance of caution it directs that no license shall be granted "until the applicant therefor shall have signed a waiver of any claim to the use of any particular frequency or wave length or of the ether as against the regulatory power of the United States because of the previous use of the same, whether by license or otherwise." The maximum term of licenses for broadcasting stations is fixed at three years, but the commission has limited its licenses to six months, after first having fixed even shorter periods. The commission has also exercised its power to reallocate frequencies, change or reduce the time of operation and refuse renewal of licenses in order to delete what it deemed undesirable services. While prior use and station investment have been weighty factors in the determination of public interest or convenience [General Electric Co. v. Federal Radio Commission, 31 F (2d) 630 (1929)], they have not always deterred the commission from eliminating stations or curtailing their privileges. To the claim of deprivation of property the Supreme Court answered: "That the Congress had the power to give this au-

thority to delete stations, in view of the limited radio facilities available and the confusion that would result from interferences, is not open to question. Those who operated broadcasting stations had no right superior to the exercise of this power of regulation. They necessarily made their investment and their contracts in the light of, and subject to, this paramount authority" [Federal Radio Commission v. Nelson Bros Bond and Mortgage Co., 289 U.S. 266, 282 (1933)].

The determination of public interest, convenience and necessity rests largely with the commission. Judicial review is limited to questions of law; and "findings of fact by the commission, if supported by substantial evidence," are conclusive unless clearly "arbitrary, or capricious." In the exercise of this review in recent years there has been a decided tendency to support the commission's determination. The Radio Act contains another safeguard in the provision denying the licensing authority the power of censorship and prohibiting interference by it with the right of free speech. The provision effectively prevents previous censorship of individual programs, and the commission has not attempted it. But general censorship inevitably arises when the commission determines, on the basis of past or promised programs, which of several applicants shall be awarded an available license. Until radio technology discovers an abundant supply of facilities, the ancient freedom can be protected only by the wise selection of administrators.

The lack of facilities has been advanced also as the conclusive answer to the suggestion that broadcasting stations be placed under the public utility obligation of making their services available to all applicants on equal terms. The Radio Act requires that a licensee who has permitted one political candidate to broadcast through his station must afford equal opportunities to the opposing candidates for the same office. But it does not require that the initial use be permitted. Licensees who engage for hire in the telegraphic or telephonic transmission from point to point are, however, required to serve all applicants on equal terms and along with telephone and telegraph companies are subject to the regulatory powers of the Interstate Commerce Commission in the matter of rates. Proposed legislation placing all methods of communication under the unified control of a single commission on communications will doubtless effect desirable results, although it cannot avoid the discrimina-

tion necessitated by the limited broadcasting facilities.

Private law too has felt the detonation of radio. Whether a person who has been defamed in a radio speech may have redress against the several broadcasting stations; whether one broadcasting station has recourse against another which picks up the former's program and makes use of it; whether copyright owners have rights against the several broadcasting stations in a chain, against a station which broadcasts an unauthorized public performance and against the hotel keeper and restaurateur who by means of loud speakers bring the programs to their patrons, are all questions to which land law as developed provides no ready answer [*Buck v. Jewell-La Salle Realty Co.*, 283 U. S. 191 (1931); *Sorensen v. Wood and KFAB Broadcasting Co.*, 123 Neb. 348 (1932)]. In Europe even more than in the United States these and other problems of private law have arisen in troublesome complexity (see especially Neugebauer's discussion).

International agreement is almost as important as national control, not simply to promote international communication but to avoid destructive interference by foreign transmissions with radio communication within the individual nations. International cooperation began with a conference at Berlin in 1903. A second conference in Berlin in 1906 resulted in the first international radio treaty. Successively superseding treaties were signed at London in 1912, at Washington in 1927 and at Madrid in 1932. The Madrid convention amalgamated the theretofore separate telegraph and radio conventions into one International Telecommunication Convention. But separate regulations are provided for radio and telegraph, and adhering nations may choose to be bound by only one of the sets of regulations. There are also supplementary radio regulations, designed primarily for the European countries and those in which transmitting stations are government owned. The United States delegation has accepted only the convention and the principal radio regulations. The treaty allocates the radio frequencies among the several services, such as broadcasting, commercial, maritime, aeronautic and police, but attempts no distribution among the signatory nations. Each nation may allocate frequencies as it desires; but if interference in other countries should result, the assignment must be made only in accordance with the allocation among the services specified in the regulations. Regional international conferences, such as the North

American Radio Conference, and regional or bilateral agreements, such as that between the United States and Canada, are encouraged. The Bureau of the International Telecommunication Union at Berne is made the clearing house for radio information. Claims of frequencies for transoceanic communication must be filed with the bureau, although no provision is made as to the effect of priority of claims. The bureau must be notified also of the employment of frequencies, in any service, which may interfere with reception in other countries. Arbitration is recognized as the method of settling disputes.

Probably more than any other industry radio has been built on patents. Thousands of patents on basic instruments or improvements have been issued to diverse persons. The manufacture or use of radio apparatus has consequently been involved in a maze of patent litigation, in which judges, whose knowledge of radio has been acquired only in the course of the litigation, have been called upon to decide the issues of invention, priority and infringement. The handmaiden of the patent, monopoly, was found to be the logical means of resolving the struggle for patent supremacy. When wireless communication was still confined to the transmission of messages between ship and shore, the British Marconi Company, which owned or controlled a majority of the world's shore stations, refused to communicate with stations equipped with other than Marconi apparatus. The partial prohibition of this practise by the Berlin convention of 1906 and the further prohibition by the London convention of 1912 were the principal achievements of those treaties. In the United States the concentration of patents in the Radio Corporation of America, coupled with devices which required patent licensees to purchase certain unpatented parts from the corporation, was alleged to have created a virtual monopoly in radio manufacturing. Enforcement of these license provisions was finally enjoined as violative of the Clayton Act [*Lord v. Radio Corporation of America*, 24 F (2d) 565 (1928), 28 F (2d) 257 (1928), 35 F (2d) 962 (1929), 47 F (2d) 606 (1931)], and a government prosecution of the corporation under the federal antitrust laws resulted in the entry of a consent decree calculated to break up the concentration [*United States v. Radio Corporation of America*, 3 F. Supp. 23 (1933)]. The Radio Act requires the commission to refuse licenses to any person convicted of "unlawfully monopolizing or attempting unlawfully to monopolize, after February 23,

1927, radio communication . . ." or of having "been using unfair methods of competition" and authorizes the courts, in suits under the federal antitrust acts, to revoke the licenses of guilty defendants. It further prohibits the unified ownership, control, operation, "directly or indirectly," of public, point to point radio and wire or cable communication systems, if the "purpose is and/or the effect thereof may be to substantially lessen competition or to restrain" interstate or foreign commerce "or unlawfully to create monopoly in any line of commerce."

The peculiar characteristics of radio have thus evoked a distinct radio law. But the legal controls have been shaped largely by the state of the art and require continual revision if they are to keep pace with its progress.

RADISHCHEV, ALEXANDR NIKOLAEVICH (1749-1802), Russian philosopher of the Enlightenment. Radishchev received his early education in the home of his father, a landlord known for the humane treatment of his serfs. At the age of seventeen young Radishchev was sent by Catherine II to the University of Leipsic, where besides preparing himself for an administrative career in accordance with the wishes of the empress he eagerly absorbed the ideas of Rousseau, Helvétius and Mably. Upon his return to Russia he served successfully as an official in the senate and in the College of Commerce and was finally appointed head of the customs office of St. Petersburg.

While in office Radishchev continued his interest in the ideas of the Enlightenment; he translated Mably's *Observations sur l'histoire de la Grèce* and contributed to a periodical published by Novikov, with whose Masonic circle he maintained friendly contact. Under the immediate stimulus of Raynal's works he wrote in 1781-83 his ode, *Volnost* (Liberty), with its eulogy of Cromwell and Washington, and in 1785-89 his chief work *Puteshestvie iz Peterburga v Moskvu* (A journey from St. Petersburg to Moscow). The latter work, composed in a form borrowed from Sterne and consisting of a series of descriptive sketches of everyday life in Russia, constitutes one of the first and most eloquent attacks on the lawless regime, the corruption of the ruling classes and the ruthless exploitation of the peasantry by a greedy gentry. Radishchev appealed to the Russian rulers to establish a constitutional regime based on equality of rights and pleaded above all for the emancipation of the peasants by free consent of their masters. Should such consent be denied, Radishchev predicted a bloody revolt of the oppressed masses. Catherine II saw in his book a picture and criticism of her own regime and, still under the fresh impression of the developments of the French

Revolution, ordered Radishchev's immediate arrest and trial. He was condemned to death, but the sentence was commuted to ten years of exile in remotest Siberia. As an exile Radishchev continued his literary activity and among other publications wrote an essay in which he attempted to disprove the materialistic thesis of Holbach and Helvétius with the aid of arguments drawn from Mendelssohn's *Phädon*; he himself wavered between deism and materialism, leaning more markedly toward the former.

Radishchev was permitted to return to his estate in 1797 by Paul I and was completely rehabilitated with the accession to the throne of Alexander I. Not only was he allowed to return to St. Petersburg, but he was even called upon to serve on the commission which was charged with the task of introducing the regime of legality in Russia. Sharing the general expectation that Alexander would upon his coronation decree a constitutional regime Radishchev at the suggestion of Count Vorontzov, who remained in close contact with the circle of the czar's young friends, working for reform in a private committee, drew up a remarkable constitutional project which incorporated the ideas outlined in his main work. The project did not materialize, however, and its author, despondent over its failure, committed suicide.

RADOWITZ, JOSEPH MARIA VON (1797-1853), Prussian statesman and political thinker. Radowitz, a descendant of Hungarian nobility, was born in Blankenburg. After serving under Napoleon and the Hessian government he entered the Prussian general staff in 1823 and rose to distinction in Berlin court circles, particularly in the so-called "crown prince group" of the

later king Frederick William IV, whose most intimate friend and counselor he became. He was the cofounder of and from 1831 to 1835 the leading contributor to the *Berliner politisches Wochenblatt*, the first journalistic vehicle for conservative thought. During this period he followed Haller in advocating the restoration of the feudal and patriarchal corporate state of the Middle Ages. Gradually Radowitz abandoned the Christian Germanic ideas of this group of Prussian Protestant nobles, especially after he became active as military attaché at the federal diet in Frankfurt in 1836. He then turned toward constitutionalism and, as Bismarck later did, attempted to bring together conservatism and the national idea, which in his time was championed chiefly by the liberals; as the king's intimate counselor he came out for constitutional and federal reforms. These efforts, however, were swept aside by the Revolution of 1848. In the Frankfurt Assembly of 1848 Radowitz was the leader of the Catholic Right. In 1849 he was entrusted with the leadership of Prussia's German policy and became the prime mover and director of the Prussian policy of unification of Germany without Austria. When with the Olmitz agreement of 1850 this policy came to naught, Radowitz abandoned active politics. In his later years he came to view the social question as the central problem of the state and championed an alliance of the state with the workers. He developed some ideas tinged with state socialism, such as state protection of labor and profit sharing. Both in his social thought and in his national policy he is the most prominent precursor of the later policy of Bismarck.

RAE, JOHN (1796-1872), economist, sociologist and philologist. After studying at Aberdeen and Edinburgh, Rae emigrated to Canada, where he became a schoolmaster. Dismissed for alleged inefficiency in 1848, he began his wanderings to Boston, New York, California and finally to the Sandwich Islands, floundering "on from one instability to another," unsuccessful alike at teaching, medicine, business and farming.

Even greater restlessness characterized Rae's intellectual life. A projected "philosophical history of humanity" led him into history, physiography, economics, sociology and philology. But "adverse fortune" dogged his steps. His work on the resources of Canada went unpublished; his *New Principles of Political Economy* was virtually stillborn; his essays on the Polynesian language, although praised by J. S. Mill, were dismissed by Max Müller as unimportant.

Time has abundantly increased Rae's intellectual stature. Later investigations have made it clear that Rae preceded Wundt in formulating a gesture theory of language; while both the similarities and the differences between Böhm-Bawerk and Rae have led to a favorable reappraisal of Rae's economics. One of the first to perceive the strategic role of producers' goods, Rae expounded what Mixer aptly designated a "sociological theory of capital." All future goods Rae styled instruments. While a high "effective desire of accumulation" increases the time span between "formation" and "exhaustion" of instruments, invention reduces this time span and quickens the flow of present goods. Since invention, including the translation of foreign "art," can be hastened by the legislator "acting for the community," Rae vigorously

sisted that, as private wealth and national wealth have different origins, the legislator—whose economic function should be to increase national wealth—must act contrary to laissez faire, must translate foreign arts, further accumulation and repress luxury.

Rae's sociological interpretation of the "effective desire of accumulation" was worked into J. S. Mill's *Principles of Political Economy*; his reproduction cost theory of value reappeared in the writings of H. C. Carey; his insistence on generating national productive "powers" foreshadowed List's *National System of Political Economy*; his condemnation of "conspicuous consumption" anticipated Veblen.

RAFFI, HAKOP MELIK HAKOPIAN (1837-88), Armenian writer and national leader. Raffi was born in Salmas, Persia; his family were merchants and he received his secondary education at the Tiflis Gymnasium. A visit to the eastern towns and provinces of Turkish Armenia, during which he observed the life and sufferings of the Armenians under Turkish rule, had a decisive influence on Raffi's subsequent career. He abandoned his business and went to the Caucasus, where he turned all his energies toward the development of the Armenian national movement. Under the stimulus of the famous Armenian journalist G. Arzruni he developed his literary talents. In his numerous novels, short stories and articles he portrayed with glowing ardor the heroic past of the Armenian people and the political oppression of the Armenians in his own day. Turkish Armenia he considered to be the Armenian fatherland, which was to be freed only by an insurrection against the Turks. Raffi's political aim was the creation of an independent and democratically governed Armenia. His writings contributed greatly in rousing the national feeling of the Armenians both in Russia and in Turkey; and, with Abovian and Arzruni, Raffi ranks as one of the most important of the early leaders of the Armenian revolutionary movement.

RAFFLES, SIR THOMAS STAMFORD (1781-1826), British empire builder and colonial administrator. Having entered the East India Company's service at the age of fourteen Raffles was sent in 1805 as assistant secretary to the newly created presidency of Penang in the Strait of Malacca and in 1811 was appointed lieutenant governor of Java after its capture from the Dutch. When Great Britain relinquished Java, Raffles was transferred to Benkulen on Sumatra. His continued interest

in the British control of the Strait of Malacca as a corridor to the trade of the farther East led to his suggestion that Singapore should be made a British post. In 1819 he took it for the company and it was retained despite strong opposition on the part of the home authorities. It proved to be a perfect site, according to Raffles, for a "great commercial emporium, and a *fulcrum*, whence we may extend our influence. . . ." By virtue of his insistence that Singapore be a free port it soon became the most important center of the eastern trade.

As an administrator Raffles was a better master than a servant—impetuous, insatiably ambitious, in constant trouble with the company over financial matters. In Java, Benkulen and Singapore he did much for the natives, introducing a new system of land tenure and abolishing mutilation and torture, tax farming, compulsory cultivation, gaming farms and the slave trade.

Raffles took a great interest in the culture, antiquities and natural history of the Malay region. Sympathetic concern for the Malays led him to establish the Singapore Institute for native education. His *History of Java* (2 vols., London 1817; 2nd ed. 1830), for which he was knighted, contains considerable first hand information concerning Java. His contemporary scientific reputation has been somewhat eclipsed, however, by the phenomenal growth of his political child, Singapore.

RAI, LALA LAJPAT. *See* LAJPAT RAI, LALA.

RAIFFEISEN, FRIEDRICH WILHELM (1818-88), German agricultural cooperative leader. The son of a village burgomaster, Raiffeisen after being trained for the military was appointed in 1843 regional secretary in Mayen. Between 1845 and 1865, when he resigned because of illness, he served as burgomaster of a number of small German towns and villages around Neuwied. After his retirement from public service he conducted a small business estab-

ishment but devoted most of his energies to the cooperative movement.

The famine years of 1846-47 brought to Raiffeisen's attention the plight of the poor peasants and villagers, who even after the emancipation of the peasantry suffered from ignorance and poverty which made them the prey of usurers. In 1846 Raiffeisen founded and expended a large part of his modest personal fortune upon the Weverbuscher Konsumverein, a welfare society which by its cooperative mill and bakery effected a drastic reduction in the cost of living. In the succeeding years he established in several villages and towns a number of *Hilfsvereine* and loan banks, which he subsequently transformed into agricultural credit cooperatives, having become convinced that personal credit was the outstanding need of the poorer peasantry. Like Schulze-Delitzsch and other cooperative leaders of his time, Raiffeisen envisioned cooperation not only as a method of satisfying the immediate material needs of individual communities or occupational groups but as the vehicle of popular education and moral renaissance.

His theory and program were elaborated in his *Die Darlehnskassen-Vereine als Mittel zur Abhilfe der Noth der landlichen Bevölkerung* (Neuwied 1866-87), which went into five editions during his lifetime and was reprinted in 1923 by the general union of the German Raiffeisen cooperative societies. In 1872 he founded the first regional central cooperative bank; in 1876 he organized a national central agricultural bank and the following year he united all the societies which adhered to his program. The movement spread rapidly after 1880.

Although they were based in many respects on Schulze-Delitzsch's plan of credit societies for urban artisans and tradesmen, Raiffeisen's societies introduced innovations to meet prevailing conditions among backward rural communities, thus he emphasized the philanthropic aspect and the authoritative and conservative character of the cooperatives. Because of these features it may be questioned whether he bridged completely the step from welfare to self-help organizations. A pious evangelical Christian, Raiffeisen laid great stress upon the religious aspect of these societies and won for them the cooperation of religious leaders and institutions, although they were never confessionally restrictive. His remarkable personality and complete devotion to the movement won

* many friends, but its success was due to the

soundness of his understanding of the basic needs and character of the German peasantry. Despite some deviations and improvements which must be credited to the able work of his early collaborator, Wilhelm Haas, the vast majority of German societies which still bear the name of *Raiffeisenvereine* and the spread of similar societies in other countries bear testimony to the significance of his program.

ERNST GRUNFELD

Consult: Krebs, W., *Aus dem Leben Friedrich Wilhelm Raiffeisens* (2nd ed. Neuwied 1925).

RAIKES, ROBERT (c. 1735-1811), English promoter of Sunday schools. At the age of twenty-one Raikes succeeded his father as owner and publisher of the Gloucester *Journal*, and the files of the paper reflect his philanthropic interests during the years of his management. He was particularly active in efforts to improve conditions in the jails of Gloucester and of England in general. The work for which he is held in remembrance, however, is his early participation in the Sunday school movement. A chance visit to the slums of Gloucester called his attention to the "misery and idleness" of the children at play in the street, and further inquiry elicited a story of especial license on Sundays. Raikes was at once convinced "that it would be at least a harmless attempt, if it were productive of no good, should some little plan be formed to check this deplorable profanation of the Sabbath." To this end he employed four schooldames, at a shilling a Sunday, to receive such children as came to them and to instruct them in reading and the church catechism. Thus two old factors, the schooldame and a religious subject matter, united with an element of novelty, namely, a Sunday session maintained by philanthropy, to form the Sunday school. The first school in Gloucester was established in 1780, and because of the publicity Raikes was able to give it in the columns of his paper the movement spread rapidly. Within three years some two thousand poor children were enrolled in similar schools in Leeds and Yorkshire, and by 1818 a parliamentary return showed that nearly a half million pupils in England and Wales were attending Sunday schools. The effort at popular education in England by this means gave way at the close of the century to the more comprehensive program of the National Society and the British and Foreign School Society, which provided day schools for the children of the poor on the basis of a monitorial plan of instruction. That Raikes

was not the first to arrange free instruction for poor children on Sunday is well authenticated, but it is equally true that his experiment in Gloucester was the starting point, not only of Sunday schools for the poor on an extensive scale but of the entire system of philanthropic school societies which laid the foundation of the English elementary and infant school system.

EDWARD H. REISNER

Consult: Harris, J. Henry, *Robert Raikes, the Man and His Work* (London 1889); Massey, J. W., *Robert Raikes, a Pioneer of Education* (Reading, Eng. 1930); Wodehouse, Helen, *A Survey of the History of Education* (London 1924) p. 144-46.

RAILROAD ACCIDENTS. Accidents associated with railroading are of two types, those in which employees are killed or injured and those in which other persons, that is, the traveling public and trespassers, are involved. The risk to employees corresponds to the industrial accident risk in other industries, while accidents to other persons constitute a non-industrial or public risk, a type of hazard peculiar to the transportation industry. A third type of accident, in which railroad equipment or property is damaged but without loss of life or injuries to persons, is of relatively less importance and will not be discussed here.

The non-industrial or public risk attracted early attention because of the interest of the public in the safety of its means of transportation. Heavy damages assessed for injuries suffered by passengers led the railroads to take special precautions to prevent accidents. Almost equally important from the point of view of arousing public interest in the problem of accident prevention were the grade crossing accidents, which caused many casualties to persons using other means of transportation.

Most civilized nations today have governmental agencies for the supervision of safety devices on railroads and the investigation of accidents as well as for the collection of statistics relating to the latter. But because of varying requirements for the reporting of railroad accidents, statistics are not internationally comparable. In some countries railroad accident figures are available for only the state railway systems; in others only the great trunk lines are covered; in still others statistics do not include all accidents resulting in injury.

Again, to permit of comparison between the experiences of different countries a common measure of risk, based upon comparable figures

of railway accidents in relation to railway accident exposure, is required. This is not available. In pre-war Austria, for example, governmental reporting included two measures of risk: accidents per 1,000,000 train kilometers and casualties per 1,000,000 train kilometers for all persons only (train employees not separated). No indices for post-war Austria have been computed. In France the measures of risk have been accidents per 1,000,000 train kilometers and casualties to railway men per 1000 railway men. In Germany the measures of risk have been accidents per 1,000,000 train kilometers and per 1000 full time workers.

The United States, since 1910, has had the most complete system of railroad accident reporting in the world. Its measures of risk are the following: passenger casualties (killed and injured separately) per 1,000,000 locomotive miles and per 1,000,000 passenger miles; trespassers (killed and injured separately); employee casualties (killed and injured separately) per 1,000,000 man hours, by occupations and also by roads and occupation for freight and passenger trainmen separately. The composite index of safety used by the committee of award of the E. H. Harriman Memorial Medals may be noted in this connection. The record for each railroad is summarized in a single figure in which fatalities are given the weight of five non-fatal injuries; also casualties to passengers in train accidents are rated per 100,000,000 passenger miles, those to passengers in train service accidents per 1,000,000 passengers carried, those to employees per 1,000,000 man hours, and those to other persons (except trespassers) injured at protected grade crossings or as a result of a vehicle or pedestrian running into the side of a train per 50,000 locomotive miles.

Because of incomplete and non-comparable statistical returns it is impossible to present the record of the fight against railroad accidents on an international basis. This article will therefore be concerned largely with the United States; it may be pointed out, however, that American progress in coping with railroad accidents has been duplicated in considerable degree in other countries. The increasing safety of passengers in railroad transportation in the United States is shown in Table 1, which gives annual average casualties for five-year periods from 1888 to 1931. Casualties to railroad passengers in non-train accidents are not included.

The decided improvement in passenger safety as indicated in Table 1 is relatively greater than

TABLE I
NUMBER OF PASSENGERS KILLED OR INJURED IN RAIL-
ROAD TRAIN AND TRAIN SERVICE ACCIDENTS
ANNUALLY, UNITED STATES, 1888-1931

PERIOD*	KILLED	INJURED
1888-1892	316	2,582

would appear from this series of absolute figures, since the decline in passenger casualties has been attained in face of an increasing total of train and passenger miles of transportation. If the year 1900, for example, is compared with 1931, the number of passengers killed per 1,000,000 passenger miles decreased from 15 to 2.1, a reduction of 86 percent; while the total number of passenger deaths fell from 249 in the earlier year to 46 in the later year, or a reduction of 81.5 percent. It is true that during the last two years of the series, 1930 and 1931, part although not all of the decrease in accidents was due to a decrease in transportation during the depression.

Accidents in 1931 in train and train service which proved fatal to passengers were as follows: 1 due to collision, 3 to derailments, 19 to getting on or off cars or locomotives, 9 to being struck or run over, 6 to suicides and 8 to miscellaneous causes. The injuries were distributed among these causes as follows: collisions 244; derailments 232; getting on or off cars or locomotives 843; struck or run over 13; attempted suicide 2; miscellaneous 744. Noteworthy is the relatively small number of casualties in recent years resulting from collisions and derailments. In the past collisions have been caused largely by failures of personnel, such as errors of train dispatchers, disobedience of orders by engineers and conductors and inability of engineers to control trains. The early and general adoption of the block signal system, which provided a continual check upon the movements of trains, and the increasing use of automatic train control devices, particularly during the 1920's, materially reduced the danger to passengers from this source. Derailments are due for the most part to failures of track or equipment, such as broken rails and defective switches; floods and

washouts also are responsible for accidents of this kind. In order to cope with problems presented by these types of accident railroads have inaugurated systems of track inspection; locomotives also are inspected so that dangers from defective boilers and the like may be eliminated.

A second major constituent in the risk of accident to the traveling public is to be found in the hazards at grade crossings. Of the 1811 persons killed at grade crossings in the United States in 1931 only 191 were pedestrians; 1331 were riding in automobiles and 239 in motor trucks. Of the 4657 persons injured only 148 were pedestrians, while 3583 were in passenger automobiles and 721 in motor trucks. Accidents of this type showed a steady increase from 730 killed and 1204 injured in 1900 to the peak of 2568 killed in 1928 and 6804 injured in 1929. Since these years the numbers killed and injured have declined slightly, no doubt as a result of the decrease in railroad and highway traffic during the depression. The marked rise in highway travel by motor vehicles is directly responsible for the significant increase in this type of accident; and despite employment by public authorities of safety posters, signposts and signal devices to warn the motor traveling public of the presence of grade crossings and their dangers the hazard continues to be a serious one. It can be eliminated only by the removal of grade crossings and the depression or elevation of motor highways at points of intersection with railroad tracks. While a few such crossings are removed annually, the great cost attending such a program on a wholesale scale stands in the way of the abolition of the risk. Nevertheless, the growth in the absolute number of casualties at grade crossings should not be accepted as proof that the problem is beyond control; the ratios of deaths and injuries from this type of accident to total automobile registrations have shown marked declines in recent years. In 1917, 2.17 persons were killed per 10,000 automobiles registered; in 1931 the ratio was 0.61. In the earlier year 6.02 persons were injured per 10,000 automobiles registered as compared with 1.68 persons injured in 1931. An analysis of fatalities by type of vehicle involved shows a somewhat higher rate for motor trucks than for passenger vehicles. It is interesting to observe that the protection of crossings does not altogether eliminate this risk, for, in 1931, 37 percent of the accidents occurred in spite of the presence of closed gates, watchmen and various types of visible or audible signals. In 1932 there were

237,035 highway grade crossings on the Class 1 railroads in the United States, of which fewer than one seventh (30,809) were protected; during the year 1447 were eliminated and 815 were added, making a net reduction of 632.

Accidents to trespassers represent a third type of railroad accident involving the public. In 1900 the total number of trespassers killed in the United States was 4346; the total number of injured, 4680. The maximum number killed was reached in 1907 when the total was 5612; by 1931 it had dropped to 2489. The maximum number of trespassers injured was 6488 in 1915; in 1931 the number of injured was 2977. In this type of accident the very high proportion of killed among the total casualties is noteworthy, for nearly half result in fatalities. This is no doubt due to the fact that these casualties include so many cases of vagrants who are overtaken while walking the tracks or killed while "bumming" a ride on moving trains. Measures for reducing this type of accident are exclusively within the province of the railroads and consist in a more vigilant policing of the tracks and trains to prevent unauthorized persons from trespassing.

The industrial risk to employees in railroad transportation is of no less importance than the

risk to the public. It includes, in addition to casualties suffered in the train and train service accidents, casualties suffered in non-train accidents; namely, in maintenance of way and structures and maintenance of equipment operations. The number of American railroad employees killed decreased from an annual average of 3273 during the five-year period 1911-15 to 1446 in 1921 and to 677 in 1931. This last marked a decline of nearly 80 percent during the whole period and of over 50 percent during the later ten-year period. The decrease in the number of railroad employees injured was almost equally striking, dropping from an annual average of 148,640 during 1911-15 to 104,530 in 1921 and to 23,358 in 1931. The low figures for 1930 and 1931, however, were due in part to the falling off in traffic during the depression. In terms of locomotive miles, as a measurement of the incidence of casualties among railroad employees, fatalities decreased from 0.70 per 1,000,000 locomotive miles in 1925 to 0.37 in 1931, a decline of nearly 50 percent. For purposes of comparison with other industries exposure to risk is best measured in man hours. Fatalities to railroad employees on duty per 1,000,000,000 man hours decreased from 362 in 1922 to 212 in 1931, a drop of 41 percent, as compared with

TABLE II

NUMBER OF RAILROAD EMPLOYEES KILLED OR INJURED ON DUTY BY CAUSES OF ACCIDENTS, UNITED STATES, 1931

a drop of 68 percent over the same period for all employees in industry. It is abundantly clear from these figures that a remarkable decrease in accident hazard to railroad employees has been achieved during the past decade in the United States. The causes of accidents to employees on duty on American railroads in 1931 are given in Table II.

The prevention of accidents has long occupied the attention of both the railroads and the public authorities. Governments in particular have taken steps to safeguard passengers and employees. In the United States regulation was at first wholly in the hands of the states, which passed laws requiring signboards at public crossings, limiting the speed of trains and prescribing the use of bells, lights and the like. In 1882 Connecticut enacted a measure regulating safety appliances, and New York followed in 1884. With the passage of the federal Safety Appliance Act of 1893 the federal government entered this field, laying down requirements for the use of power brakes and automatic couplers. Other important milestones in federal safety legislation were the following: the law of 1910, requiring efficient hand brakes and sill steps; the Accidents Reports Act of 1910, providing for a report by the railroad, under oath, of the cause of each accident as well as for an investigation by the Interstate Commerce Commission whenever necessary; the Hours of Service Act of 1907, limiting the hours of consecutive duty of any employee to sixteen, except in cases of emergency; the Ash Pan Act of 1908, stipulating that locomotives be equipped with automatic devices for emptying and cleaning the ash pans and thus eliminating a type of accident which often occurred during cleaning; the Boiler Inspection Act of 1911, which was later extended to cover all defects in locomotives; and the Transportation Act of 1920, by which the Interstate Commerce Commission was authorized after investigation to require the installation of automatic train control and stop devices.

As a result of these laws the commission receives reports on all railroad accidents, inspects locomotives and cars, investigates the causes of all major accidents and publishes accident statistics. The annual reports of the Bureau of Safety, which is responsible for inspection, indicate the results of its inspections of railroad equipment and the progress of the work of installing automatic train control devices. According to the report for the fiscal year ended June 30, 1932, 11,538 miles of road, 20,562

miles of track and 9318 locomotives have been equipped for automatic control.

The efforts of the railroads themselves to lower accident rates have included the establishment of safety divisions and the inauguration of safety contests between the different roads. Personnel policies designed to prevent accidents, for example, the elimination of color blind persons from employment as engineers or firemen and insistence upon abstinence from alcoholic beverages, were early adopted as routine procedures. The favorable result of all these measures taken as a whole is shown in the statistics already presented.

RAILROAD RATES. *See* RAILROADS.

RAILROADS

GENERAL. Among modes of transport, as seen in the perspective of history, the railroad is conspicuous by virtue of its conjunction of exceptional technical merits with the unique service opportunities afforded it by the industrial revolution. Canals and improved roads served tolerably well the youth of modern industry during the late eighteenth and the early nineteenth century, but speed, cheapness and ubiquity unattainable by these means were essential to that free movement of materials and that expansion of markets required by the matured transformation of industrial processes. In Great Britain the successful experimentation with steam tractive power during the 1820's elicited an eager re-

sponse; numerous bills authorizing railroad construction were speedily presented for parliamentary action, and the British railroad net was shortly in course of development. On the European continent the lag in industrial change was reflected in a qualified enthusiasm for the new transport agency; but with a larger measure of state participation and with greater regard for the railroad's significance as an instrument of political strategy and national defense, extensive railroad construction also followed without long delay. But the role of the railroad as handmaiden of the factory system in the older countries was less striking than its use in the exploitation of vast undeveloped areas throughout the world. The early successes in England exerted their strongest influence in the United States. A substantial westward movement to the fertile lands of the interior began before 1800 and grew rapidly after the War of 1812. To weld the economy of the frontier and of the developed coastal areas into effective unity, however, was a task made formidable not alone by distance but by mountain barriers as well. Turnpike construction, even under the stimulus of federal aid, could provide no economical outlet for the bulky products of the west. The Mississippi-Gulf route was long and hazardous, and the Appalachians were not to be traversed by artificial waterways. The one direct sea level route, exploited through completion of the Erie Canal in 1825, demonstrated by its success the importance of western commerce; and the rise of New York challenged such rival centers as Baltimore and Philadelphia to establish western connections. An extraordinary opportunity existed for the railroad to show its worth. Of the early construction projects the majority were modest in purpose; only a few embraced this larger vision. But as the practicability of rail transport was established, no undertaking was too grandiose to claim support, and the railroad became the major instrument in subduing the continent. The example thus set in North America was followed, in a manner hardly less striking, in opening to commerce vast areas in Asia, Africa, Australia and South America.

The assignment of any date to mark the beginning of rail transportation must be arbitrary. In a technical sense the railroad sprang, during the first third of the last century, from the union of two fairly distinct lines of development. One of these, the use of rails to ease the movement of wheeled vehicles, had been proceeding in England for two hundred years in connection with

mine and quarry operations. The other, the application of steam power to road vehicles, dates probably from the appearance of Nicolas Cugnot's steam carriage on the streets of Paris in 1760, the year of Watt's successful stationary engine. The rails, originally made of wood, underwent numerous modifications through the addition of wear resisting plates and of flanges to keep wheels in place, the flanges being transferred in due course to the wheels; from 1767 they were extensively made of cast iron and from 1800 of wrought iron, which proved able to sustain the impact of steam locomotives, although in America, well into the railroad era proper, reasons of cheapness led to the use of wood and even of granite rails stripped with metal. Vehicles on the early railroads or tramways were pulled by horses, or the loaded movement was by gravity with the return effected by stationary engines; but from 1800 there began experiments to adapt steam driven vehicles to rail use. During the first quarter of the century a solution was found for such elementary problems of locomotive construction as the maintenance of adequate boiler pressure and the adhesion of wheel to rail without the use of cogs, and some use was found in colliery service for the low speed locomotives that were built.

But rails and steam do not make a railroad. In a functional sense the railroad originated only when the physical instrument was employed as an agency of public transportation service and not as a mere plant facility. A tramway was chartered for public use in England as early as 1801; and before it was clear what the motive power would be, a number of railways designed for general use were under way both in England and in America. Of these the English Stockton and Darlington Railway employed a Stephenson locomotive in 1825 to haul thirty-four cars at a speed of fifteen miles per hour; it undertook the general carriage of coal for a group of neighboring collieries and derived some additional business in moving merchandise and passengers. But it was the Liverpool and Manchester Railway, after conducting the Rainhill competition of 1829 won by the "Rocket," George Stephenson's great engineering success, which dramatized the promise of the steam railroad as a general transportation agency. That same year the first British built locomotives tried out in the United States were found to be excessively heavy for the light track construction. But locomotive building was under way in America and from the successful demonstration of Peter

Cooper's "Tom Thumb" in 1830 proceeded rapidly, with a considerable export movement by the end of the decade. The Baltimore and Ohio Railroad, chartered in 1827 and opened with thirteen miles of line in 1830, which experimented at the outset with horses and even with sails as means of power, was shortly committed to the steam locomotive; while the Charleston and Hamburg Railroad, opened in 1831, was expressly designed for steam power.

With the basic features of rail transportation thus established, progress along technical and operating lines was rapid. In America the weight of locomotives was doubled during the first decade, and the distribution of weight was greatly improved during succeeding years. Speed increased from the phenomenal twenty-nine miles per hour of the "Rocket" to sixty miles by mid-century. Cars were specially designed for rail service; and the passenger carriage in particular lost its early stagecoach characteristics and evolved in the direction of the modern vehicle, with its improved springs, trucks, axle bearings, couplers and comfort yielding accommodations. In the roadway corresponding developments occurred. Grades were reduced, curves flattened and flimsy structures replaced, although in these respects the standards maintained in America were behind those established in Great Britain and on the European continent. Rails were increased in weight and improved in design, especially in the manner of their attachment to ties, or sleepers, and toward the end of the century came predominantly to be made of steel. The multiplicity of gauges which appeared with the early construction of disconnected lines was gradually reduced, although it required the Civil War in America to demonstrate the supreme importance of a standardized gauge and a free interchange of cars. Similar progress was made in the handling and dispatching of trains, as required by growing traffic. Numerous experiments in signaling intervened between the man on horseback who preceded the trains of the Stockton and Darlington Railway and the block system of the 1860's. Telegraphic dispatching was a revolutionary innovation about 1850; and the automatic air brake, introduced in 1872, contributed greatly to the safe and effective handling of heavy trains. Along with marked improvements in recent years in the efficiency of steam locomotives has come a substantial use of electric traction, especially in congested areas, but to some extent also under mountainous conditions.

These qualitative changes surrounding the infancy and youth of rail transport were fully matched as to quantity by the spectacular spread of railroad lines, first in Europe and North America, then throughout the world. The growth of line mileage by thirty-year periods, classified on the basis of continental areas, is shown by Table I. It is apparent that during the

TABLE I
THE GROWTH OF RAIL LINE MILEAGE, BY CONTINENTAL AREAS

	1840	1870	1900	1930
North America	20,54	56,106	223,454	310,100
Europe	1818	65,192	176,179	261,545
Asia		5,086	37,470	82,487
South America		1,770	26,450	58,800
Africa		1,110	12,499	42,450
Australasia		1,097	14,922	30,822

Source: Adapted from *Archiv für Eisenbahnwesen*, vol. xxxv

early decades the settled nations of Europe engaged in railroad construction to about the same aggregate extent as the people of North America, but that the rest of the world was scarcely touched by rails until 1870. In Asia, Africa, Australasia and South America the rate of growth since that time has been rapid, with more than half the mileage appearing since 1900. But in absolute amount the greatest construction, at least until quite recently, has continued to occur in Europe and North America, leaving the former with 33 percent and the latter with 40 percent of the world's mileage in 1930.

Despite that larger hope of penetrating the interior which inspired the Baltimore and Ohio Railroad project, early construction in the United States consisted mainly of small, detached segments of line intended chiefly to supplement water routes and to connect nearby towns. The railroad's transition from a modest adjunct of coal mining to the instrument of a comprehensive transport system was not abrupt. The network grew at first by small accretions of limited purpose. In England the proximity of major cities led as early as 1840 to the completion of lines between such centers as London, Birmingham, Manchester and Liverpool; and by 1850 the principal routes of the present day were well established. In similar manner a network of lines developed in the more populous eastern states of the United States at an early date, and soon after 1840 Albany was united with Boston on the east and Buffalo on the west by series of short lines. But to build railroads into the thinly settled areas west of the Appalachians—to con-

struct lines in the hope thereby of attracting the population and the industry necessary for their support—involving great daring; the extension of the rail network in a few decades over the entire American continent must be regarded as one of the outstanding examples of human enterprise. By 1850 much building had occurred in the middle west, and soon thereafter Chicago was connected with the Atlantic seaboard; while in the south lines reached from Atlanta to the Ohio, the Mississippi and the Atlantic. Construction continued into the farther west, and in 1869 occurred the most spectacular single event in American railroad development—the joining near Ogden, Utah, of the Union Pacific and the Central Pacific to form the first transcontinental route. Progress had gone far; but to the 53,000 miles of line built in the United States during the first forty years of the railroad era there were added 200,000 more during the next half century, the zenith of construction activity being reached during the 1880's. Six more transcontinental lines, including two in Canada, were built across the western plains and through the Rockies; while further construction in the east and south afforded access to nearly all useful portions of those areas. From 1910 the construction of new lines subsided, and after 1920 abandonments exceeded new construction, although the capacity of existing lines continued to expand to meet the needs of traffic.

If economic immaturity hampered railroad enterprise in America, in Europe the obstacles sprang from established usages, vested interests, high land values and the conservative temper of an older community and business life. Less stirred than England by the industrial revolution, Germany and France proceeded somewhat more slowly with railroad construction; but the mileage in these and in a number of other European countries was considerable by 1850, although at that time the ultimate framework of their rail systems was less clearly indicated than in Great Britain. When comparison is made, on the basis of their present development, between the railroad network of these old and densely populated European areas and that of the United States, it is apparent that the line mileage of the latter country (and likewise of Canada, Australia and Argentina) is much greater in relation to population served than is the case in Europe; on the other hand, the European network covers with a much finer mesh the area it serves.

European enterprise in railroad building likewise projected itself into every industrially

backward section of the earth, supplying much of the capital invested in the United States and actively undertaking construction in Canada, northern and southern Africa and South America. India was given one of the great railroad systems of the world; the Trans-Siberian Railway was pushed across the vast expanse of northern Asia to connect Europe and the Pacific; and the Berlin-to-Bagdad Railway was built into the Near East. With China's permission Russia constructed the Chinese Eastern Railway across Manchuria; while Japan not only built a large mileage at home but also entered China by constructing the South Manchuria Railway to connect the Chinese Eastern with Port Arthur. Table II indicates the line mileage of the principal countries of the world for 1930.

Yearbook of Railroad Information.

Such evidence of continued railroad construction suggests how eminently successful a transport instrument the railroad proved to be. In view of the part it played in the great economic developments of the nineteenth century the traffic which it came to carry was mainly new traffic not previously moved by any other

method. At the same time the railroad largely displaced such other transport agencies as were not effectively protected from its competition. During the eighty years following 1750 the turnpike had assumed an important commercial role; but as rail lines were built, road transport came to possess a purely local significance. A few rivers, like the Rhine, retained their worth, and by heavy subsidies and protective legislation France and Germany were able to maintain the use of their canals. But the United States, despite large outlays on canals and the apparent success of some of them, turned as early as 1840 to the railroad as its most promising means of transport. For some time traffic continued to grow moderately on the Erie Canal and the Mississippi, and not until about 1880 did an absolute decline set in. But by 1870 the railroads of New York state had passed the canal in tonnage carried and by 1900 had outstripped it ten times over; and a substantially parallel shift in traffic occurred in the Mississippi valley. Water transport except on the Great Lakes and in coastwise vessels became negligible. There was thus established for the railroad a position of dominance which remained unchallenged until the 1920's.

To bring about so striking a development, at least in a time so short, private enterprise however dynamic was not enough; in most countries government in one way or another lent its active support to railroad building. England alone seems to have depended wholly on private capital and private initiative. In France the government provided rights of way, guaranteed interest on railroad obligations and undertook some direct construction. Many of the German states built their own lines, and private undertakings were often subsidized. The first railroad building in Belgium was a state enterprise. In Austria at the beginning the government opposed railroad construction, but it was shortly subsidizing private roads and building lines itself. The outlays of European capital in establishing railroads in the Latin-American countries were largely encouraged by public subsidies and guaranties. Early construction in India was similarly promoted, although here, as in Australia and South Africa, rail lines have largely resulted directly from state enterprise. The unique relation of transport development to the total economic structure as well as its bearing on political cohesion and military need served in practically every country to induce a generous collective interest in railroad building.

Such was the case in the United States. Despite the opposition of persons engaged in road and water transport activities and accessory occupations, a powerful popular enthusiasm for railroad construction led, from the first decade of the railroad era, to extensive governmental aid. Towns and counties donated sums of money, provided terminal sites and made other land grants in addition to guaranteeing railroad bonds or exchanging their own for them. States subscribed to the stock of railroad enterprises, guaranteed their bonds and made liberal loans in addition to allowing tax exemptions, providing convict labor and contributing millions of acres of land. Pennsylvania, Virginia, North Carolina, Georgia, Michigan, Illinois and Indiana engaged directly in the construction and operation of lines, although subsequently they withdrew in favor of private interests. The federal government had contributed extensively to internal improvements during the first quarter of the century, but no substantial aid was given the railroads until after 1850. From that time and until 1871 federal land grants were made to the railroads, both directly and through the states, which totaled over 150,000,000 acres. Not all of these grants were taken up, because of failure to meet attached conditions; and the roads receiving land assumed obligations to carry government troops and supplies and mail at reduced rates. Direct financial aid of substantial amount was also extended to the early transcontinental lines.

It is not feasible either to estimate the total subsidy received by American railroads or to appraise the extent of the responsibility of subsidy for their development. Certainly government aid accounts for only a very small fraction of the total investment to date, although in offsetting the early hesitancy of private funds its importance was great. On the whole it seems proper to regard the railroads of the United States as an impressive product of private enterprise, since despite public aid the difficulties faced and the risks assumed were exceptional. On the physical side there have been few more striking accomplishments than the construction of railroads across the plains and through the forests and mountains of North America; and on the financial side the commitment of vast sums for serving traffic, the emergence of which was largely dependent upon the railroad itself, constituted enterprise of the most speculative type. During the early decades of railroad construction private financing was accomplished mainly through the

sale of securities to persons, often of small means, living in the immediate localities to be served. But from about 1860 railroad finance began to assume those more spectacular features which made it the dominant element in the operations of the larger financial centers. From the time when railroad construction began seriously to penetrate the western portion of the country, to assume proportions beyond the scope of local resources and to attract millions of European capital, and with the appearance of large dealings in railroad securities—by Vanderbilt, Drew, Fisk, Gould and other so-called magnates—the financing of railroads began to color the whole of the nation's financial life. It is anomalous that the scores of individuals who pioneered, along engineering and business lines, to spread the railroad net and establish effective service—who, by their enterprise, made the railroads possible—are less well known than the outstanding manipulators of share control in the security markets. But in considering the second major phase of railroad development, the combination into systems of the scraps of line originally built, it is not improper to assign the magnates a prominent if not always a creditable place.

However admirable the enterprise of early builders, their efforts were often ill suited to the broader needs of national and international commerce. The connection of widely separated producing and consuming areas was at first the incidental result of the joining of intermediate points; it is not surprising that private builders, whether or not they envisaged the potentially profitable traffic between remote termini, should have laid their plans with reference mainly to the more certain traffic near at hand. Nor can it be said that the influence of government generally reflected a broader vision. State and local subsidies in the United States, stimulating efforts to secure a maximum of public aid, definitely promoted irregularity of layout. The railroad activities of the small German states were governed by strictly local interests. The elementary essential of gauge uniformity was overlooked in the construction of state systems in Australia. France alone seems to provide a clear example of railroad development in conformity with an early plan of national scope, although in many countries the later construction, whether directly by government or with public aid and guidance, disclosed broad visioned economic or political design. A highly critical view need not be taken of the more spontaneous sort of railroad

development, since all ambitious planning has its dangerous side and since the magnificent energy and adaptability of private enterprise offset its limited outlook. But it must be recognized that early construction provided merely the raw material—and often a highly resistant raw material with respect to both location and technical features—for the creation of larger systems designed to meet the broader needs of commerce. By the process of combining small railroads into large there were developed not only the great private systems of Great Britain and the United States but also the public systems of Germany and India.

In the United States the process whereby the disconnected short lines of the mid-nineteenth century came to form the large systems of the early twentieth was extremely varied in motive, method and result. At a time when potential end-to-end connections were often dissimilar in gauge and when, even if they were not, there existed a complete absence of those inter-system arrangements necessary to effective through service, the obvious way to improve operations over a series of lines was to bring them under common ownership. Opposing influences were the hostility of local producers to competition from a distance and the early difficulty of managing successfully a road more than one hundred miles long. But end-to-end combinations had been proceeding inconspicuously before the formation in 1853 of the New York Central, which brought together the lines between Buffalo and Albany; and it is probable that by 1870 as many as fifty combinations, each comprising from two hundred to one thousand miles of line, had been organized. By that time the construction of western lines was proceeding in original segments of substantial length. These combinations were accompanied by the longer distance movement of traffic, which in turn introduced a degree of competition not previously present. Small local roads might have a fairly complete monopoly; but as important centers were connected by more than one combination of roads, there arose a competition which was often bitter and destructive. It is a curious fact that the end-to-end combinations productive of this competition were themselves promoted by it. As long distance traffic increased, a road, to possess any sense of security, had to be assured of a share of interchange traffic at junction points; and where there were rival claimants to this traffic, such security could come only through control of the connection.

This was and is today a leading consideration, more potent than reasons of service and operation, in promoting the combination of connecting lines; and it also accounts for that frantic extension of lines to tap every important source of traffic which characterized competitive railroad construction well into the present century.

Under such pressure, however, railroads were combined not only so that they might be more effective competitors but also in order to reduce the severity of competition. To the ruinous rate cutting which accompanied bitter rivalry for limited traffic the natural response was for parallel roads to act in concert. During the 1870's and 1880's, when competition was most severe, this reaction manifested itself less in an endeavor to effect unification under common ownership than in agreement by independent lines to refrain from destructive rivalry. Rates were maintained by cooperative action; and in order to remove the incentive to rate cutting pooling arrangements were established, definitely fixing the respective shares of rival roads in competitive traffic or revenue. The principle was applied in all parts of the country, sometimes to specific traffic movements and sometimes, as in the case of the Southern Railway and Steamship Association, to wide areas. A genuine need was met; but in the power thus to maintain rates on a compensatory level lay the possibility of exacting extortionate charges, and the public, traditionally hostile toward every form of monopoly, protested. In consequence the Act to Regulate Commerce, passed in 1887 in response to a swelling spirit of indignation against railroad abuses, not only provided for federal regulation of rates but declared unlawful the formation of pools, which were deemed to be a fruitful source of excessive charges. Pooling arrangements were thereafter largely terminated, but the cooperative determination of rates by traffic associations continued. In 1897, however, the Supreme Court construed the Sherman Anti-Trust Law as prohibiting railroad combinations of this character; and the railroads, if they were to remain independent from the standpoint of ownership, were thus deprived of any lawful means of reducing the excesses of competition. But since the belief was widely held that they might accomplish by corporate combination what was denied them through loose association, there occurred during the two decades following 1887, for purposes of effecting concentration of control, transactions of enormous magnitude in the ownership of railroad securities.

A false impression of the course of railroad combination would be gained, however, if it were viewed wholly in the light of operating and competitive considerations. This was the period when the goals of power and profit attainable in the field of corporation finance were first clearly recognized, and to this field were attracted some of the most ambitious and dynamic personalities in the business world. Railroads provided especially attractive opportunities for their operations. Despite its speculative and often fraudulent aspects the financing of new construction was fairly prosaic compared with vast dealings in the securities of roads already built, the purchase and manipulation of control of large mileages and the creation of ever expanding railroad systems. In the railroad field as throughout all industry the combination movement gained sharp momentum toward the end of the century, and there developed a popular faith in the magic of large corporate aggregates which was but loosely related to any technological considerations which might justify them. During lean years competition for traffic was most severe and combination had most to contribute; but it was in such periods, as after the collapse of 1893, that railroad systems fell apart. When prosperity prevailed and confidence was high, on the other hand, securities were readily sold in enterprises of every sort, and dreams of railroad empire were consummated with amazing ease by the leaders in railroad finance. Railroad combination must be viewed therefore in terms not only of the economics of the industry but of the outlook, the ethics and the psychology of the period of its development.

Under these several influences, variously operative in connection with particular combinations, the railroads of the United States during the first decade of this century approached more nearly a condition of territorial monopoly than at any time in their history. The Pennsylvania system achieved great size while retaining solidity and developed a compact structure both physically and financially. Similarly the New York Central system was shaped as an excellent service medium, although some of its elements were for some time held together rather loosely. After 1900 these two systems attained a working control of the other important lines in the eastern trunk line territory. By a purchase program, which, however, turned out to be disastrously extravagant, the New Haven for a time came to dominate all transportation, rail and water, in New England; while in the south a chaotic col-

lection of lines was brought through Morgan leadership under the control of two large and closely allied systems. In the northwest James J. Hill, both a builder and a financier, first brought the Great Northern and the Northern Pacific together through common ownership of the Chicago, Burlington and Quincy Railroad and then effected their complete control through the organization of the Northern Securities Company. This move was fought vigorously but unsuccessfully by E. H. Harriman, who, after acquiring and rehabilitating the Union Pacific, aspired to complete monopoly in the west. Harriman did succeed, however, in extending his sway over the central and southern trans-continental lines; and even without including a large mileage, especially in the east, in which the Union Pacific obtained substantial minority interests, he controlled at the time of his death in 1909 a railroad empire approaching in extent the 25,000 miles of the Hill domain. A collection of properties in the southwest, including the Missouri Pacific, long subject to the depredations of Jay Gould, became the sickly nucleus of a loose aggregate of 19,000 miles of line, stretching nearly from coast to coast, which quickly fell apart under the impact of the depression of 1907.

Among the important combinations in which railroads have been involved are those connecting them with traffic producing industries and with other transport agencies. Many railroads have been built as part of lumbering and mining activities, and a few important carriers, as, for example, the roads owned by the United States Steel Corporation, continue to be run by enterprises which they largely serve. But in such relationships the carrier has more commonly been dominant; and in the outstanding instance of anthracite coal a group of railroads, in quest first of traffic control and later of excessive profit in selling the product, created a situation which has figured prominently in the records of industrial monopoly. The movement toward monopoly in transportation led to railroad investment in canal routes, to extensive ownership of Great Lakes shipping and to control of coast-wise services. More recently the railroads have been entering the fields of air and highway transportation. Except in the latter instances the public has generally been hostile toward extensions of the railroad sphere, and legislation has been enacted to curtail them. In 1906 the "commodities clause" of the Hepburn Act forbade the carriers to transport revenue traffic, except

lumber, produced under their control; and the more direct instances of such relationships have disappeared. Likewise in 1912 the Panama Canal Act required the removal of railroad control over shipping lines competing with the railroads through the Panama Canal, and in other places where the effect of the control was markedly to restrict competition; and provisions were included calculated to strengthen water competition.

As for the movement toward monopoly among the railroads themselves, a decline set in during the early years of the century. The decision of the Supreme Court in the Northern Securities case in 1904 that corporate combination, even through the holding company device, was subject to the Sherman Law led to the paring down of systems and the sale of equities in parallel lines. An unfavorable judgment brought the dissolution of the Union Pacific-Southern Pacific relationship; and voluntary action anticipated judicial procedure in other cases. Not only was the public aroused by the menace of monopoly in all fields, but adverse business conditions undermined fair weather financial arrangements and there was no disposition to assist in new financing. Despite the alliances that had prevailed railroad rivalries were pronounced. Within the limits set by public regulation of rates the struggle for traffic was severe; and an individualistic spirit characterized railroad management, which precluded even such joint action as might have been lawful in the direction of effecting a more highly co-operative and systematic conduct of transportation. In the emergency created by the World War the attempt at voluntary cooperation under the Railroads' War Board proved inadequate; and it was deemed necessary at the end of 1917 to establish complete unification under federal control. For twenty-six months the carriers were operated as a single system by the United States Railroad Administration, rolling stock and other facilities being used without regard to ownership and the movement of traffic being controlled in the public interest. Because the increase in rates fell short of the increase in costs, the Railroad Administration failed to earn the rental guaranteed the owning corporations; but the prime purpose of achieving a free movement of traffic was successfully accomplished. It was thus demonstrated that a degree of unity and system might at times be required in the railroad industry greatly surpassing the results achieved through the adaptations of private enterprise within the restrictions set by law; and for normal

times as well it appeared to many that a radical modification of the older arrangements was desirable.

In spite of some effort to retain the railroads in public hands as a nationalized industry the political sentiment favoring a return to private ownership and operation was dominant, and the Transportation Act of 1920 so provided. At the same time provisions were adopted looking toward a more effective organization of rail service, in the interest primarily of solving the problems of the weak roads and achieving economies. The past insistence upon competition was modified to the extent of allowing the Interstate Commerce Commission to authorize pooling arrangements and under emergency conditions to require the common use of facilities. The commission was also granted comprehensive powers of supervision over more permanent inter-carrier alliances. Combinations through purchase of securities or lease of lines were to be carried out only upon the commission's approval; and combinations involving the outright consolidation of properties were to be undertaken only in accordance with a comprehensive plan to be prepared by the commission. In this plan the roads were to be assigned to systems of substantially equal strength, and wherever practicable the existing channels of trade were to be maintained. On the basic issue of competitive relationships Congress saw fit to maintain its accustomed position: the systems proposed by the commission were to preserve competition as fully as possible. The preparation of such a plan was an undertaking of overwhelming difficulty, and relief from the duty was vainly sought by the commission. In a somewhat halfhearted manner and merely as a procedural step a plan was published in December, 1929, which called for consolidation of the railroads of the United States into twenty-one systems.

Following 1920 there were numerous instances in which systems were extended or rounded out or rearranged through acquisitions of control; and in some cases the inclusion of weak lines was made a condition of such acquisitions. The most spectacular episode of the decade was the creation by the Van Sweringen brothers, largely through a succession of holding companies, of effective control over about 25,000 miles of line. The combination lacked official approval and, along with other instances of holding company control, revealed a gap in the commission's power arising from

the restriction of its jurisdiction to operating companies—a gap filled in 1933 by the extension of its authority to all methods of effecting control over carriers. In the matter of outright consolidation little progress has been made, although the commission has consented to the modification of its plan for eastern territory along lines upon which it seems that the railroads may agree. Any public plan of system formation which relies on voluntary action for its achievement must necessarily be slow of execution, since on the whole the motives which lead carriers voluntarily to combine do not correspond closely to public aims. Improved service and general prosperity during the 1920's obviated serious criticism of system organization; but with the railroads largely dependent upon public funds during the ensuing depression agitation was resumed, emphasis being placed more definitely than before on matters of economy, for an extensive reorganization of the railroad system. As an emergency measure the president was authorized in 1933 to appoint a federal coordinator of transportation to assist the carriers in the cooperative attainment of economies.

The movement toward more comprehensive units, as thus traced in some detail for the United States, has made itself felt in all other countries. In Russia, Germany, India, Australia, Union of South Africa, Canada, Mexico, Italy and elsewhere much or most of the mileage has been combined into state systems. Outside the United States nearly 60 percent of the world's mileage is state owned. In some cases state lines have been leased to private companies to operate. Public ownership moreover may mean, as in Germany since 1920, a single unified system or, as in Australia, a collection of provincial monopolies or, as in Canada, a public enterprise in competition with private companies. In France the early policy of territorial monopoly has been continued, with public provision of roadways and structures and a guaranty of operating returns. In Great Britain railroad systems grew, as in the United States, through private action; but because of less restrictive legal requirements, a greater density of traffic and the more settled temper of the business community competition never attained the violence or produced the abuses prevalent for some time in the United States. During the war the British government assumed a close control over the railroads, and in 1921 Parliament provided for a complete consolidation of lines into

four systems laid out on a territorial basis. As the new arrangement was compulsory it was consummated speedily; but despite the contrary intention inter-system competition has continued to be a potent influence in matters of rates and service.

In the course of both their original construction and subsequent combination into systems railroads have disclosed financial features which, while seemingly related to the strictly private sphere of the investor, have nevertheless evoked great public concern. Their capital arrangements and financial policies influence the services they furnish; and the very magnitude of these transactions renders them a substantial element in the total structure of the business world. The carriers of the United States originated largely under conditions militating against subsequent financial health. Under prevailing loose corporation laws roads could be and often were built and operated in a manner imperiling their solvency and the position of their investors, while enabling a few individuals to reap great fortunes. Railroad building was commonly undertaken not by the railroad companies themselves but by separate construction companies formed by those in control of the railroads, under contracts strikingly profitable to the insiders. In the case of the most notorious of these ventures, the *Crédit Mobilier* connected with the building of the Union Pacific, \$111,000,000 of securities was issued, according to W. Z. Ripley, "in order to raise \$74,000,000 of cash, to construct a railroad which actually cost about \$60,000,000." Thus a railroad might arise through the operation of motives largely unrelated to the social purposes which might justify it and enter life borne down by the millstone of obligations it could scarcely hope to meet. Once under way, it might be administered not primarily to yield service and realize income but, as in the case of the early history of the Erie, to enhance the profitability of speculation in its securities. Reports might be falsified, capital outlays and current expenditures juggled, capitalization manipulated and funds gravely needed for upkeep diverted to other ends. By such circumstances the unavoidable obstacles to railroad prosperity in a new country were greatly enhanced; and while it must be recognized that the industry was not as a whole subject to abuses of the grosser sort, there has nevertheless been great difficulty in throwing off the legacy of unsound finance and the suspicious popular attitude generated by it.

The paucity of records of actual investment in American railroads and the lack of connection between capitalization and investment render uncertain, except for recent years, the amount of capital by which the profitability of railroad investment may be tested. Without allowance for overcapitalization then persisting it appears that the net capitalization of American railroads in 1906 was approximately \$58,000 per mile of line. Among individual carriers the corresponding figure ranged from about \$30,000 for a number of western roads to nearly \$170,000 in the cases of the Erie and the Reading. Unlike physical conditions which surround construction account for important differences, as do also the widely dissimilar traffic conditions to be met; but varying degrees of recklessness and conservatism in issuing securities and in actual expenditures are quite as important factors. The average capitalization per mile of line at this time may appear low when it is noted that in Germany it was twice as great, in France two and one half times as great and in Great Britain four times as great. But in these European countries a different type of construction had been warranted; and while, if one can judge from earnings records, the outlay there may have been somewhat too heavy—assuming no overcapitalization—still the greater density of traffic seems largely to have justified the difference. Popular criticism of railroad finance in the United States sprang mainly from the belief that rates were fixed to yield a return on a grossly inflated volume of securities; and the Interstate Commerce Commission, without further facts as to the value of properties, felt itself seriously handicapped in determining the reasonableness of rates. In consequence Congress, by passing the Valuation Act of 1913, imposed upon the commission the prodigious task of inventorying all railroad properties and fixing a so-called physical valuation for each carrier, an undertaking which has since absorbed the greater part of the appropriations. Since 1906 capitalization per mile of line has increased by about 33 percent.

Whatever its past significance as the device and symbol of loose and corrupt financing, the "watered" aspect of the railroad capital structure is of less present importance than the character of the securities which make it up. While British railroads incurred debts to the extent of about one fourth of their capital and private lines in South America, Egypt and elsewhere largely follow the British pattern, the capital of American roads has come mainly

through sale of bonds. In the top heavy structures of early roads bonded indebtedness often equaled or exceeded actual investment; and while the building up of properties has reduced the fractional importance of bonded debt in relation to values, about 60 percent of the net capitalization of all roads continues to be in that form. Less than one third of the total consists of common stock, while the small remainder is preferred stock, largely of a non-cumulative type, which appeared in place of bonds in the process of financial reorganization. Bonds have revealed the infinite variety of which corporate financing is capable, and the names assigned to issues have often been designed to conceal their decidedly junior status. The debenture, secured merely by a carrier's general credit and earning power, is the principal encumbrance of British railroads; but in the United States the practise has been to secure bonds by liens on specific properties. About four fifths represent mortgages on roadways and structures, either general or divisional; and the next most important class of bond is the equipment obligation, secured by cars and locomotives. Out of the intricate interrelationships of railroad corporations has come another important type, the collateral trust bond, representing a lien on the securities of other roads. The income bond, an anomaly whose claim to interest is contingent upon the realization of earnings, is another offshoot of the reorganization process. While the extent of fixed obligations is a vital factor in the financial stability of the private company, the capital structure is of slight importance where railroads are a state enterprise, even when in form a separate railroad department or corporation is created, since the treasury is finally available to support them. Likewise it is of slight significance that French railroads are capitalized almost wholly with bonds, in view of the government's guaranty of sufficient revenue to meet interest and dividend requirements. In Germany a unique situation was created in 1924, under the Dawes plan of international settlement, when the previous debt of the state railroad system, wiped out by currency inflation, was replaced by a special bond issue of 11,000,000,000 gold marks whose service was to be on account of reparations. The Young plan of 1929 removed this obligation.

Superficially at least it appears that American railroads have been unwise in the extent of their reliance on bonds for the provision of funds. The amount of insolvency, produced mainly by failure to meet interest and principal payments,

has been enormous. During the forty years following 1875 the mileage falling into receivers' hands approximated the total mileage of the United States; some roads escaped but others repeated the experience with each decline of business. In 1932 the aggregate of carriers, while showing a substantial net operating revenue after taxes, failed by a wide margin to earn their interest requirements, and only the availability of hundreds of millions in public funds averted widespread default. It is true that this record does not constitute without qualification an indictment of the present capital structure of the roads. Early failures were caused chiefly by overbuilding and by the assumption of excessive obligations in comparison with the slight volume of available traffic. Competitive rate cutting, in part the result of legislative prohibition of co-operative action, produced a drain on revenue in no way inherent in the railroad situation. Mushroom combinations, created often by the sale of bonds to the public for the purchase of stocks in other carriers, represented a passing condition, induced largely by an unreasoning wave of optimism. Certain notorious failures may be attributed directly to incompetent and corrupt management. Moreover it may be said that railroad capitalization need not normally be constituted with an eye to such devastating catastrophes as the collapse following 1929. Despite these considerations, however, the debt of the carriers seems a proper object of serious criticism. In view of the specialized nature of railroad property, which precludes its use for other purposes, the practise of pledging assets to secure bonds is of slight significance; financial integrity depends wholly on earning power. Since railroad traffic reflects a cross section of general business conditions, it cannot be said that revenues are protected by an exceptional stability of demand, such as may justify the large funded debt of some of the local public utilities. Certain railroad expenditures are fairly inflexible in the face of declining traffic; although after 1929, with a substantial postponement of upkeep, expenditures paralleled revenues quite closely. But even if the ratio of expenses to revenues did not increase with falling traffic, the absolute difference between them must contract; and with taxes a large and rather inflexible item, debt obligations easily become embarrassing. For the carrier whose capital structure involves the average amount of indebtedness and whose earnings are no better than average, some retirement of bonds is plainly desirable. While

railroad capital was greatly increased during the latter 1920's without appreciable increase in indebtedness, sound policy would seem to require a definite reduction of debt when earnings make possible repayment at maturity either from revenue or from sale of stock; and when reorganization is undertaken, a drastic curtailment of fixed obligations is indicated.

But financial strength is a matter not only of capital structure but also of earnings through good years as well as bad. Indeed indebtedness often results from lack of earnings. The view has been widely circulated that repressive regulation, involving a restrictive rate policy, has been a major ailment of American railroads. It is not easy by factual means to evaluate this view; but on the whole it seems ill founded. It is true that after 1910 in the face of rising prices the carriers found difficulty in convincing the Interstate Commerce Commission that rates should be raised, and their credit doubtless suffered somewhat in consequence. But in most years from 1900 to 1929 more than 6 percent, often substantially more, was earned on the stockholders' equity by all carriers; and after 1920, while the rate of return was only slightly improved, the railroads were able on favorable terms greatly to increase their capital and to command their due share of new savings seeking investment. Because of peculiarities of the railroads' earnings comparisons between them and other industries have slight significance. Unlike manufacturing enterprises, the several railroads do not cooperate in supplying a single market with their services and by competition weed out the least effective of them; instead each carrier has its unique area which it must serve and upon whose traffic it must depend. Under these circumstances aggregate or average earnings figures tell little about specific roads. Probably despite low general earnings all roads with any just claim to additional capital could get it favorably. It is true that, while certain carriers have been exceedingly remunerative investments, the buyers of equities in railroads as a whole have not realized the extensive returns that have come to investors in some other fields. Railroad fortunes came from construction activities and dealings in securities. But this result may be explained not only by the regulation of earnings but by the excessive investment in an industry given artificial public stimulus. Moderate earnings seem to have characterized the railroad industry in most countries; and where state ownership prevails, and in France under the system of guar-

anty, rail transportation has often been a substantial drain on the public treasury.

In the United States the roads' financial status and policies have been touched at many points by the hand of government. Following the subsidies of early decades federal rate regulation was inaugurated in 1887 and strengthened in 1906 and 1910, with the aim in part of preventing excessive carrier incomes; and this is still the most significant form of control bearing on railroad finances. The close supervision of railroad accounts, instituted in 1906, with the enforcement of a high degree of publicity respecting railroad affairs, has served primarily as a tool of rate regulation but incidentally has checked unscrupulous speculation in securities based on manipulation of accounts and reports. From 1907 the Interstate Commerce Commission recommended that railroad security issues be subjected to its control, both as an aid to rate regulation and as a means of protecting the credit of the carriers and the investors in their securities from unsound financial practises; such authority was granted in 1920. As a further means of insuring financial stability power was given the commission to veto proposed line extensions which might prove wasteful or destructive in effect, although a corresponding authority was also granted to prevent abandonment where carrier losses were outweighed by counter considerations of public convenience and necessity. With the extensive control established over the combination of carriers into systems railroad finance has been brought very largely under public supervision, except in the matter of dividend policy; but it may be noted that in this respect too sharp criticism has been directed at the carriers, particularly in view of their distribution in 1931—in the absence of much evidence of forthcoming economic betterment—of sums vastly in excess of current earnings.

Railroads touch the public most intimately, however, not through their organization and finance but through the specific services they render shippers and travelers and the rates they charge for these services. There is no pricing problem more complex than that involved in the sale of rail transportation of freight. American railroads recognize some twenty-five thousand descriptions of traffic, any item of which conceivably may move from any one to any other of many thousands of stations. The possible number of rates required is of astronomical proportions. No simple principle, as that of applying the same rate per hundred pounds to all the

different commodities and the same rate per mile to all the different hauls, would be theoretically or practically acceptable. Even if there were no other consideration involved than to spread the costs of service as evenly as possible over all traffic, the weight mileage basis would be bad. Early railroads took over from wagon transportation the practise of charging on a space basis for carrying low density commodities; and in a much more discriminating fashion it is now recognized that loading characteristics are as important as weight in assigning charges. Shipments in less than carload lots amount to less than 2.5 percent of the tonnage of American railroads, but they account for 25 percent of the loaded cars, and they involve a disproportionate part of clerical expense and terminal handling. Coal moving at extremely low rates is one of the most remunerative forms of traffic. Commodities differ widely in the special services they require and the loss and damage claims they occasion. In the treatment of different hauls rates proportional to distance received early application and are still employed in passenger transportation, but they depart widely from the cost principle. Heavy terminal costs necessitate rates tapering with distance, but to a diminishing extent as the haul lengthens. Unequal traffic densities and widely different capital and operating costs on different routes likewise call for recognition. Thus cost factors alone account for a high degree of complexity in the rate structure; but despite their importance there are considerations of another sort, springing from the conditions which must be met in getting and holding traffic, which have been of major significance in the evolution of freight rates.

The outstanding characteristics of a railroad from the rate standpoint are two: the customary presence, especially when historically regarded, of unused capacity in some or all of its facilities and the large outlays involved in providing that capacity. Not only did the superiority of rail over other transport agencies justify construction for relatively light traffic, but the overhead costs occasioned by even a minimum plant proved relatively heavy as judged by most other businesses. In early decades at least such costs increased much less rapidly than traffic; and many operating costs, such as are involved in a minimum of maintenance and of train service, were likewise capable of being spread over more traffic. There thus existed the strongest possible inducement to depart from a cost basis of rate fixing: to impose charges as low as necessary to

get traffic as long as the effect on profits was positive and to impose as high rates as feasible on traffic not easily discouraged. If peculiarities of the industry provided the incentives to discriminatory charging, they also supplied the conditions which made it possible. The great cost of railroad construction, and the necessity of physical contact of the railroad plant with the area served by it, established a position of monopoly with respect to a large part of the traffic; and the fact that rail service is not a homogeneous commodity, but is sold to buyers who can be classified on the basis of goods shipped and routes shipped over, afforded a further condition of discriminatory pricing. As between types of traffic, the value of the commodity has long been recognized as a rough gauge of rate paying ability; while as between different hauls, the presence or absence of competitive rail, water or other carriers, whether directly parallel or serving alternative sources of supply for important markets, induced a nearly complete departure from that consistent relation of rates to distance which a cost basis would impose.

Freight classifications and tariffs are the evolutionary product of such cost and traffic factors as have been mentioned, modified by regulation. A score or so of classes seem adequate to recognize the peculiarities of the thousands of commodities and forms of shipment. Classification was first undertaken by individual roads, then carried on by traffic associations; and, in the interest of obvious elements of economy and convenience, it has evolved in the United States under the encouragement and guidance of the Interstate Commerce Commission into a Consolidated Freight Classification by which a single volume gives in parallel columns the class ratings for all descriptions of traffic in three classification territories, the so-called Official, Southern and Western. The percentage relations between classes vary considerably, but to a large extent railroads believe it necessary to depart from the system of class rates, especially where a commodity moves in large volume over a given route or where some special competitive factor is present. Thus in the United States fully 80 percent by weight of all freight traffic moves at exceptional or commodity rates; and in Great Britain a similar situation prevails despite an attempt, through complete overhauling of the rate structure, to accommodate the bulk of traffic in the regular classes.

With mileage relegated to a minor role in fixing rates on specific hauls the relation of

charges as between different points of origin and destination developed without any systematizing factor; the result is a confusing maze of charges that almost defies description, one which makes the practical task of quoting rates to shippers enormously difficult and cumbersome. The United States is divided into a larger number of territories for tariff purposes than for classification, and innumerable tariff publications are issued by individual carriers and small or large cooperating groups of lines, covering rates to and from specified points and areas for one or a few or a great many commodities or for all traffic moving on the classified basis. On branch lines and non-competitive hauls a mileage basis may prevail; but to a dominant extent competitive relationships, often of long standing, remain influential, despite resulting disparities as judged by distance. On long routes between points favored by water competition, especially in the south and west, rates were at one time commonly lower than on the shorter hauls between included points on the same lines, but under the pressure of regulation prejudicial relationships of the grosser sort have been largely eliminated. More generally there have been created rate groups within which all points are treated equally for hauls of any length. Such groups have been as large as the entire territory east of the Mississippi and even larger for Pacific coast shipments. Competitive equality has been maintained for the several combinations of roads meeting at junction points along the Ohio and Mississippi rivers; and on export and import traffic the carriers serving the various ports have had their position maintained by a system of differentials. So important is transportation cost in the market price of many commodities that the survival of producing centers and areas, and of the carriers serving them, is greatly dependent upon the relationship of rates; and although a master critic of American economic arrangements might not wholly approve the existing channels of commerce and localization of production, actual commitments are properly the weightiest consideration in judging proposals for change.

Of all features of rail transportation it is the fixing of rates which has been most extensively regulated. For this purpose primarily the elaborate regulation machinery typified by the Interstate Commerce Commission was created. Even in the earliest days of rail transport some effort was made to control rates, mainly through charter provisions and general legislative limita-

tions; the growth of abuses and of the problem's complexities led to the establishment of administrative commissions. In part the purpose of rate control was to prevent a monopolistic level of charges. The Granger legislation of the 1870's was designed chiefly to meet the evils of exorbitant rates, and this purpose was also included among the objectives of the original federal statute of 1887. In the control of rates from this standpoint the requirement that rates be "just and reasonable" has necessarily been construed with reference to broad segments of the rate structure; for when the propriety of carrier earnings is questioned, it is the general rate level and not individual charges which is at issue. Many important controversies of this character have been determined, especially since 1910; and the commission's responsibilities toward carrier revenues were given fuller and more affirmative expression by Congress in 1920 and again in 1933. But quite as important in accounting for rate regulation were abuses connected with specific charges and their relationship. Of these the most obviously obnoxious was the favoritism extended individual shippers, especially those controlling large traffic, in order to get their business. This evil was met by the enunciation in 1887 and the workable formulation in 1903 of the elementary rule of equality of treatment of shippers of the same commodity under like circumstances. Another and similarly elementary objective of regulation was the removal of business uncertainty incident to frequent and sudden changes in rates. But more serious than these abuses, especially when judged on the basis of the continuing activities of the commission down to the present, have been the unfair relationships of rates, as between different commodities and different routes and hauls, produced by the broad latitude within which the carriers have fixed rates according to the ability of traffic to bear them. The justification of departing from the principle of even cost distribution has been noted; and it was never the purpose of Congress or of the commission to prevent the roads from so fixing rates as to utilize their capacity and spread their overhead. Neither was the public alarmed by that larger economic waste which might be induced by the rate structure in stimulating unduly remote producing areas and excessive lengths of haul, especially since it was at all times anxious to have the maximum number of sources of supply competing in each market. In the scramble for traffic, however, charges were often imposed

which were grossly unreasonable as judged by other comparable charges; and where commodity movements were competitive, such serious prejudice often resulted that it appeared that the fate of industries and areas rested with the caprice of railroad traffic officers. Such power over a nation's economy could not properly reside in an uncontrolled private industry. In 1854 the British Parliament had declared against undue prejudice in the treatment of patrons, and in 1873 a tribunal was established to administer the principle of reasonable rate relationships. The congressional mandate that rates be just and reasonable has been as applicable to individual rates as to the general level of charges; and other provisions have declared explicitly against duly discriminatory and prejudicial rate relationships. The authority accorded the Interstate Commerce Commission in 1887 has been extended by successive amendments, so that complete power to control individual rates is now vested in it. Thousands of specific cases have been decided; and, especially in recent years, the commission has been frequently concerned with comprehensive proceedings, designed to bring about such readjustments as would render the total rate structure more rational and more coherent.

It is apparent that the difficulties of rate control are directly related to the organization of the rail system and that these difficulties have attained a maximum in the United States. With a large number of companies of widely unequal earning power it is impossible to adjust rates so as to sustain the weak without unduly enriching the strong. Moreover with an area occupied by a number of competitive carriers the likelihood of improper relationships is greatly increased. It is inaccurate to say that competition is responsible for discrimination; but the presence of competition at some points, combined with its absence at others, is productive of prejudicial relationships. Where railroads are combined regionally, as in Great Britain and France, a symmetrical rate structure is facilitated; but it is by no means accomplished, since many cities still enjoy competitive services and non-parallel lines serving rival producing areas continue to compete. A complete railroad monopoly, when governmentally operated or stringently controlled, is freest from the economic influences making for bad rate adjustments. But whatever the state of railroad organization, rate adjustments are affected by the competition of other carriers, either by water or on the highways; and the belief that railroad

rates cannot be controlled satisfactorily unless the charges of alternative agencies are subjected to the same control accounts in part for efforts to establish a more extensive regulation of motor and water transportation. As the temptation to adjust rates unfairly varies with the extent of unused capacity, the problem is most serious when railroad construction outstrips the growth of tonnage, when the appearance of new agencies threatens the loss of traffic and when a generally low state of business activity reduces the total demand for service.

No less important than the charges which railroads exact are the character of the services which they render and the operating practises on which both rates and service depend. If revenue receipts are taken as a rough measure of the services performed by American railroads, it appears that the carriage of passengers is a relatively minor function for the average road, accounting for about one seventh of its revenue. About four fifths comes from freight, and of the minor items making up the remainder the most important are the mail and express services. Individual carriers of course depart widely from the average. In Great Britain passenger service yields more than a third of rail revenue, and the proportion is similar in much of western Europe; while in Japan it accounts for more than half of the total. Travelers resort to the railroad less frequently in the United States than in a number of other countries, a condition prevailing even before the present wide use of automobiles; but the usual journey is relatively long, averaging now, with commutation traffic excluded, more than seventy-five miles, an average whose 40 percent increase in ten years reveals the greater effect of motor competition on the shorter journey. But the relatively great importance of freight service in the United States is due in the main not to a smaller passenger traffic but to a larger per capita production of goods and to a long average haul exceeding three hundred miles. Ton mileage per capita in 1929 exceeded 3500.

The growing importance of the railroad as a means of passenger transport, from its supersession of the stagecoach to the rise of the automobile, was paralleled by a striking improvement of service. Out of the early springless vehicles whose occupants were showered with engine soot there evolved comfortable coaches, supplemented by sleeping and dining facilities, which made travel less an ordeal and to many a pleasure. A speed of fifty miles an hour includ-

Railroads

ing stops became feasible; and at the same time accidents to passengers fell to negligible proportions. But the generally high level of performance attained was by no means adequate to withstand the devastating competition after 1920 of the automobile. Low rate commutation, or suburban service, and high rate Pullman service, which accounted for half the total passenger mileage, could not do much more than maintain their absolute position until the depression; but from 1923 to 1929 day coach travel in the United States decreased by more than 40 per cent. With the sharper declines after 1929 the passenger revenues of few roads covered even those operating expenses which could be allocated, much less any return on capital devoted to passenger facilities. In response to this condition many services have been abandoned, rail cars with self-contained power units have been substituted for regular trains, and to an increasing extent special excursion or round trip rates have replaced the regular fares; but more drastic measures appear necessary. Incipient technical developments include the air conditioning of coaches and the designing of lightweight and streamlined trains capable of 100-mile speeds, which may revolutionize the quality of service. General reductions in basic fares appear likely; and an increasing cooperation of railroad companies will probably bring some elimination of duplicated services.

While less manifest to the casual observer, the evolution of freight service, through improved construction of roadways and structures, the better design and greater size of cars and locomotives, the speeding up and regularizing of operations and its closer adaptation to the peculiarities of traffic, outweighs in economic importance the changes in passenger transport. Although essential similarities exist in the developments in different countries, there have likewise been striking differences, as in the emphasis in Great Britain on the timely movement of small consignments in small capacity cars and the opposite emphasis in the United States on low cost bulk movements. Much progress, especially in freight transportation, has depended on inter-company cooperation; and developments in this respect have reached a high level, despite opposition, as in the United States, to drastic reduction of railroad competition. Early cooperation, often international, was aimed at gauge uniformity; but for free interchange of traffic the standardization of equipment and repairs was scarcely less important

and commanded early attention. Organized cooperation in the United States in the latter direction began during the 1860's when the Master Car Builders' Association was formed. Along with technical cooperation numerous business arrangements are necessary to the effective handling of interchange traffic. The through billing of freight must be provided for, and with the quotation of joint rates machinery for their division among connecting lines must be established. As cars move off the lines of the owning road, arrangements must be entered into for compensation for their use, for their repair, both ordinary and extraordinary, and for a reasonable promptness of return. Great difficulty has been experienced in providing adequate incentives for the "homing" of cars, without creating an excess of empty running. In the United States many of these activities are directed by divisions of the American Railway Association, an organization which originated in the conventions held for standardizing railroad time, but which later turned its attention to formulating rules respecting demurrage, signals and safety matters generally; it now includes the Freight Claims Association and sponsors the research conducted by the Bureau of Railway Economics. In addition sectional groups of carriers conduct, by means of traffic associations, the preparation and publication of tariffs and police the weighing and billing of shipments. Interline routing of freight and exchange of equipment take on a political aspect when national boundaries intervene. Thus most of the European governments signed the Convention and Statute on the International Régime of Railways of 1923; and the League of Nations has promoted railroad cooperation.

An issue in the organization of railroad service which has always been present in various guises is the extent to which the railroad company itself should assume direct responsibility for rail services and facilities. At the outset it was thought that only the roadway should be provided and that it should be made available to various users as canals and turnpikes were; but the danger and confusion of such an arrangement were quickly apparent. With tractive power provided by the railroad, however, it is still possible for the several services to be conducted independently. There were, for example, the independent freight lines which after the middle of the last century provided through interline services on American railroads, prior to the establishment of effective cooperative arrange-

ments between carriers; and on the same principle sleeping car and express services have been independently supplied. Moreover for services under direct railroad control cars have often been provided on a rental basis by shippers or car owning companies. In Great Britain private cars are common; while in the United States the majority of tank cars, many refrigerator cars and some coal and livestock cars are separately owned. When cars are owned by shippers, technical progress may be impeded and empty car mileage increased; but when, as in the case of Pullman cars, specialized equipment is made freely av-

more economical utilization is attained than would be possible through direct railroad ownership and the administration of car service rules. To an important extent and in a manner productive of serious abuses freight forwarding companies stand between shipper and carrier in their capacity of consolidating small consignments into carloads. These companies often undertake the collection and delivery of freight, a function long performed by the railroad itself in Great Britain and a number of other countries. Under the spurt of motor competition American railroads are beginning in a tentative manner to extend their services to the shipper's door in the handling of less-than-carload freight. In several instances, notably with regard to express, American railroads own the companies performing separate services; and the general tendency is toward a more inclusive conception of the function of the railroad company.

From a more strictly managerial standpoint the provision of rail transportation has revealed many unusual aspects. Besides the peculiarities as to financing and pricing which have been noted special significance attaches to the wide ramification of the physical plant and the exceptional problem of supervision created thereby in the proper maintenance of roadway and rolling stock, the operation of trains and the control of labor. The hazards of the industry necessitate large outlays, otherwise unremunerative, in the interest of safety; and the continuous flow of loss and damage claims and the innumerable contacts with regulative authorities require almost as extensive participation of the legal as of the engineering profession. For the specialized performance of functions it is necessary that management be departmentalized; but it is equally necessary that it be organized territorially for the recognition of local needs. These two principles, the departmental and the divisional, clash some-

what; but both are recognized, with probably a greater emphasis on the latter in the larger American systems. In view of the importance of training and experience on the part of workers operating trains railroad labor enjoys an exceptionally strong bargaining position; and this circumstance, combined with the public stake in continuous rail service, has given unusual prominence to labor relations in the conduct of the industry. Numerous features make for a highly routinized performance, a condition which has led to the observation that the industry is one peculiarly fitted for government operation. But on this ground it seems equally pertinent to observe that the industry is one in which, because of a strong tendency toward inertia and routine, exceptionally dynamic leadership is required if it is to move forward in the changing realm of transportation. The likely source of such leadership, whether private or public, is another matter.

On the whole the character of service and the manner of providing it in the United States have been left to private management. The leading exception has been the stringent safety regulations, the influence of which has been most praiseworthy. But after 1900, as traffic caught up with carrier capacity, there were frequent and serious car shortages, which impeded the conduct of business. Responsibility may be assigned to inefficient operations, poor credit or ineffective inter-carrier arrangements; but whatever the cause, the World War brought a crisis in rail transportation which led the federal government to operate the roads as a single system. Before this time the only action of the Interstate Commerce Commission in matters of car service had been directed at abuses growing out of the assignment of private cars to mines; but in 1917 and 1920 authority was granted it to supervise and enforce adequate car service rules, to require the provision of reasonably adequate facilities, and in emergencies to compel their common use, as well as to establish priorities and direct the routing of traffic. Whether or not because of the mere presence of these powers, for they have been little exercised, the carriers managed in the ensuing decade to carry a growing traffic with almost complete freedom from congestion and car shortages and with conspicuous expedition of service. A more credible explanation may be found in the prevailing sentiment that private operation was on trial and in the emerging fear of road and water competition. The establishment of machinery through

shippers' advisory boards to cooperate with shippers in anticipating car requirements constitutes one of the more concrete evidences of the new spirit of enterprise. Improvements in service were paralleled by economies in operation, as shown by most of the so-called indices of efficiency. One of the more inclusive of these, gross ton miles per train hour, advanced 60 percent in eight years. These results were made possible not only by an energetic managerial approach but by generous capital outlays.

It may well be that rail transportation, like other basic constituents of social living, is not accorded in popular thinking a just measure of its significance; but, on the other hand, it is strikingly true that through the century of its development the industry has seldom failed to keep itself squarely in the public eye. From the early and unsuccessful opposition of entrenched business interests the railroad passed through four decades of almost unqualified public enthusiasm and support, in which it was identified with revolution in industry and exploitation of territory. It is true that charters imposed restrictions, that during this early period mildly regulatory acts were passed in Great Britain and that the French system of close governmental supervision was beginning; but in the United States the menace of railroad favoritism and monopoly provoked serious popular alarm and action only after 1870. From then on, through state legislation and the enactments of Congress in 1887, 1903, 1906 and 1910, there was established a machinery of regulation, concerned primarily with rates, whose nature and intent reflected the widespread conviction that so indispensable an agency subject to so many actual and potential abuses must be closely restricted and controlled. But prevention of abuses was not enough; it became increasingly apparent that public policy should embrace the further aim of promoting positively a vigorous and effective railroad system. To this end it was never seriously considered that restrictive regulations should be relaxed; indeed a strong sentiment had developed, reaching its height following the end of the World War, that the government should assume complete responsibility for rail transportation through public ownership and operation. This view did not prevail; but in 1920 Congress rewrote the Interstate Commerce Act to the end that the commission thenceforth should be definitely concerned with promoting a sound financial condition in the industry and the performance of a high level of service through

adequate provision and systematic arrangement of railroad facilities.

Perhaps, as is sometimes contended, the direct results of this legislative expression of an altered popular attitude were slight; but within a decade two developments served to crystallize a more sympathetic public response to the problems of the carriers. The first of these was the growth of rival transport agencies, especially on the highway, which undermined railroad monopoly and aroused concern over the future of the industry. The second was the general business breakdown after 1929, which greatly increased the sense of social dependence upon the railroads. On the latter account the fear was not merely that financial embarrassment would impair operations but that extensive defaults on railroad obligations would shake the entire financial fabric of the United States, in view of holdings totaling perhaps \$7,000,000,000 of railroad bonds in the hands of insurance companies, savings banks and other institutions of great public importance. It was realized also that inactivity in steel, lumber and other basic industries was much intensified by the impoverished state of the railroads. For these reasons railroads, next to banks, were the principal beneficiaries of emergency credit extended by the government through the Reconstruction Finance Corporation.

Doubtless during the depression years of 1932 and 1933 too pessimistic a view was taken of the railroads' position, because too large a responsibility for their immediate plight was attributed to the competitive factor and too little to the supposedly temporary general breakdown. It is but necessary to recall that in 1929, despite competition, the railroads were in a strong financial position and to recognize that only a slight fraction of the decline in traffic since that year is explainable by the further diversion to rival agencies. Nevertheless, the future position of the railroads must be considered largely with reference to the growingly serious competition of other means of transportation. The operation of millions of motor vehicles over paved highways has cut deeply into the passenger and less-than-carload freight traffic of the railroads and with greater menace into certain types of carload freight, such as cotton and livestock. Most of the vast traffic in motor fuel moves by pipe line; while the railroad movement of coal is affected by the long distance piping of natural gas and transmission of electric power. The intercoastal movement through the Panama Canal and the operation of barges on rejuvenated waterways

have become substantial factors; while commercial air transport is seeking high class passenger, mail and package business. The combined attack of these rivals has led to predictions that the railroad will go the way of the stage-coach and early canal boat. Foreseeable developments, however, afford slight basis for such an expectation. The position of the railroad, strengthened by measures quite free of the taint of artificial resuscitation, seems secure.

Such bolstering of the railroad's position may occur along three lines: restriction of competition, removal of burdens and improvement of operations. Of these the first is most obvious and is most open to abuse in view of the danger of denying the public the full advantage of progress in transportation. Whether competition is restricted by the licensing system usually applied to motor carriers, by limiting the size and weight of road vehicles or by permitting railroad control of rival agencies, there may easily be a sacrifice of beneficial developments through undue regard for the railroad viewpoint. But where loss of revenue from a limited range of traffic will weaken the railroad in serving traffic for which the rival provides no adequate substitute, the balance of public advantage may warrant restriction. Nor does public gain accrue from competitive services offered at unremunerative rates or at rates made remunerative by an artificially low level of costs. The economy of truck and barge operations results in part from inferior labor standards and in part from indirect public subsidies. It is debatable how adequately motor transportation pays for the use of public roads, in addition to a reasonable general tax contribution, although it appears that in some jurisdictions the levies are sufficient. The availability of toll free waterways obviously subsidizes the water carrier. It is only reasonable to allay such fears for the railroad's future as are due to a competition unable fully to pay its way.

Doubtless also the railroads have been subject to a variety of burdens and impediments which can be lessened if their continued health is genuinely at stake. Property taxes, for example, weigh exceptionally upon an industry of such extraordinary capital requirements that it takes the revenue of four normal years to equal the value of its property. Whatever the expediency of tax relief, there seems only a sterile legal reason for requiring railroads to make large unremunerative outlays for highway grade separations, the occasion for which is the growth of road transport. Similarly the duty to continue a

service once undertaken has diminished force from a broad social viewpoint when the traffic producing power of an area has declined or when traffic has to some extent passed to rival agencies which are able, without disastrous consequences, to supplant the railroad. There are many thousands of miles of line in the United States whose continued use must burden the remaining mileage and the traffic which it serves; and despite the hardships to communities sometimes occasioned by abandonment any doubt regarding the general integrity of the rail system argues the reasonableness of that expedient. But very largely such embarrassment as the railroads have experienced may be explained only in part by loss of traffic; it is even more directly attributable to the attempted support of a capital structure, a burden of fixed obligations, improper in an industry subject to marked fluctuations. Where this is the case the remedy raises no fear as to the patient's life. The view is a common one also that the railroads have been most weighted down by the very regulation to which they have been subject; but few convincing considerations can be adduced in its support. While some changes in regulatory policy would doubtless prove helpful, particularly through an increased emphasis upon coordination of transportation agencies, any far flung relaxation of the impact of government control would probably be opposed by the carriers themselves.

Adaptation of the railroads to new conditions must come mainly through their own efforts. Possibilities remain of improving service and reducing cost. Recent technical developments suggest that passenger transport may become much faster, cheaper and more comfortable than the railroads now provide, although reasons of cost must prevent any sudden general replacement of existing facilities. With productive activity in the United States devoted increasingly to manufacturing and the distribution of manufactured goods and, in agriculture, to the growing of fruits and vegetables, the railroads must modify still further their traditional emphasis on slow quantity movements. While any great effort to retrieve certain parts of the traffic lost to other agencies would be ill advised, a full readiness to make feasible changes seems necessary, whether in methods of service or in those rate relationships which derive from a monopoly situation. If one may judge by the resistance to trucking competition offered by British railroads, despite a typical length of haul and size of consignment within the range largely usurped

by the truck in the United States, the combination of fast scheduled freight services and prompt collection and delivery by railroad vehicles is an effective competitive weapon, although one properly limited to routes where the movement is substantial. It seems that the employment of road vehicles, freight and passenger, in both line haul and terminal operations, affords the railroads many opportunities to cut costs and improve service. But undoubtedly some of the most important economies are to be obtained only through a lessening of duplication in service and through a modification of the competitive organization of systems, a course dependent in part on legislative changes. No justification remains for conducting competitively the enormously expensive less-than-carload service; and it has been suggested that the jointly owned Railway Express Agency, Inc., might expand to perform this function. The pooling principle may also be applied more extensively, especially in the passenger field. But it is possible to go much further, particularly if competitive incentives are a luxury which can no longer be afforded by an imperiled railroad industry. Thus estimates of annual savings all the way up to a billion dollars or more through a drastic reorganization of American railroads into regional systems have been made by persons whose views may not lightly be dismissed.

But while the way seems open to considerable strengthening of rail transportation in its relation to competitors, the need for action, although great, is less imperative than may appear in the gloomy half light of a prolonged economic depression. Given a substantial recovery, most rail carriers should not suffer, despite competition, from lack of traffic. Where cost is a consideration, air transportation offers no serious threat in the foreseeable future; nor does the waterway, except through a determined policy of governmental support. Because of highway competition the place of the railroad in passenger transport in the United States seems destined to be a limited one, unless drastic changes are effected; but fortunately the chief dependence of the railroad, especially in the United States, is freight. The minimum cost per ton mile in motor trucking seems certain to remain several times the average cost by rail where quantity shipments are extensive and average hauls are long. The greater availability of energy resources by wire and pipe line is an important competitive factor, but it probably does not threaten any serious absolute reduction in the

railroad movement of fuel. With the restoration of a higher level of general business and a fair public attitude in formulating relevant policies, it seems that with ordinary enterprise the railroads should retain their dominant position in transportation.

I. L. SHARFMAN
SHOREY PETERSON

LABOR. The public has a direct interest in the relations between railroads and their employees, since it demands continuous and uninterrupted operation and efficient and safe transportation. The public is concerned also with the question of remuneration, because railroad wages constitute the major portion of operating expenses, which in turn react upon rates. Whether the railroads are owned by the government or by private companies, the labor problem is bound sooner or later to become an object of public scrutiny and regulation. Its magnitude in strictly labor terms can be realized from the fact that in four countries alone, the United States, Great Britain, Germany and France, the railroads in 1929 employed over 3,500,000 persons.

The wide array of crafts encompassed by the industry may roughly be divided into four classes. The highest degree of selection and skill is represented among the men engaged directly in the movement of trains: engineers, firemen, conductors and brakemen. These workers in addition to their skill must possess physical endurance and mental alertness. Next in importance are the shopmen employed in the building and repair of equipment: machinists, blacksmiths, boiler makers, electrical workers, sheet metal workers, firemen, oilers, carmen and others. Both types of work involve a skill acquired only after years of apprenticeship. The greatest number of unskilled workers are to be found among those engaged in the maintenance of way and structures, where, outside of a relatively small group of supervisory officials and skilled persons, there is a large body of section men and common laborers. The miscellaneous services include a number of occupations of varying skill, principally those of station agents, clerks, baggagemen, telegraphers, flagmen and gatemen.

For many years the railroad industry showed a steady increase in the number of employees, but during the past decade the trend has been in the opposite direction. In the United States the decline in all carriers was from 2,075,886 in 1920 to 1,902,222 in 1923 and 1,694,042 in 1929, a

year of peak prosperity; at the end of 1932 railroad employees numbered fewer than 1,000,000. In Great Britain the reduction was from 736,000 in 1921 to 616,000 in 1931. There have been similar decreases in other countries. Although in the United States the drop since 1929 has been largely a result of the temporary effects of the economic depression, much of it may be traced to the permanent changes in the industry before 1929; of these the most important are technological advances, which have increased efficiency without enlarging the volume of business, and competition from motor transportation, which has taken business away from the railroads. In lesser degree these developments affect the industry in other countries. The workers have been the chief sufferers, as a result of losses in employment opportunities.

There is considerable variation in wages, hours of labor and other working conditions among railroad employees, according to the nature of employment, skill and bargaining power. Railroad wages reached their peak during the World War, but since then they have been subject to a gradual deflation; and very rarely has their level exceeded those of similar skills in other industries. Because of the decrease in employment there has been a substantial decline in total wages and salaries—from \$3,681,000,000 in 1920 to \$3,004,000,000 in 1923 and \$2,896,000,000 in 1929. Average yearly compensation has risen only slightly. In some places, especially European countries, the regular rates of pay are supplemented by extra payments and other allowances. For many years the railroads were notorious for their long hours of work, a situation that has been remedied to a large extent in recent years, mainly by means of legislation tied

up with safety laws. The workers have been trying to achieve extra pay for overtime and the recognition of the principle of seniority in promotions and employment, but in neither case have far reaching results been attained. Considerable progress has been accomplished, notably outside of the United States, with regard to pensions and other insurance benefits.

In the United States the organization of workers in the industry has been almost entirely on a craft basis. There are at least 23 unions. The trainmen's brotherhoods, the most powerful group, include the Brotherhood of Locomotive Engineers (1863), the Order of Railway Conductors (1868), the Brotherhood of Locomotive Firemen and Enginemen (1873) and the Brotherhood of Railroad Trainmen (1883). There are nine unions affiliated with the American Federation of Labor as members of the Railway Employees' Department: the International Brotherhood of Boilermakers, Iron Shipbuilders and Helpers (1880), the Brotherhood of Maintenance of Way Employees (1886), the International Association of Machinists (1888), the Sheet Metal Workers' International Association (1888), the International Brotherhood of Blacksmiths, Drop Forgers and Helpers (1889), the Brotherhood of Railway Carmen (1891), the International Brotherhood of Electrical Workers (1891), the Switchmen's Union of North America (1894) and the International Brotherhood of Firemen and Oilers (1898). Other railroad workers' unions affiliated with the American Federation of Labor are the Order of Railroad Telegraphers (1886), the Brotherhood of Railway Clerks (1898), the Order of Sleeping Car Conductors (1918) and several locals of Pullman porters not yet united into a national body. There are also the Brotherhood of Railroad Signalmen (1901), the American Federation of Railroad Workers (1901), the American Train Dispatchers' Association (1917), the Brotherhood of Dining Car Conductors (1918), the Railroad Yardmasters of America (1918) and a few minor organizations covering agents, station employees, colored workers and a rival group of yardmasters.

The powerful trainmen's brotherhoods include the great majority of all persons engaged in those occupations. Their members occupy a strategic position in the movement of trains and can be replaced only with difficulty in case of strikes. So strong are these unions, which have measurable control over wages and working conditions, that they have throughout most of their

WAGES AND SALARIES OF RAILROAD EMPLOYEES AND
RATIO OF OPERATING EXPENSES TO REVENUE,
UNITED STATES, 1920-29*

YEAR	NUMBER OF EMPLOYEES	WAGES AND SALARIES (UP \$1000)	YEARLY AVERAGE	PERCENTAGE RATIO OF OPERATING EXPENSES TO REVENUE
1920	2,022,812	3,681,801	\$1820	94.4
1923	1,857,674	3,004,972	1617	77.9
1924	1,751,362	2,825,775	1613	76.2
1925	1,744,311	2,860,600	1640	74.2
1926	1,779,275	2,946,114	1656	73.2
1927	1,735,105	2,910,183	1677	74.7
1928	1,656,411	2,826,590	1706	72.6
1929	1,660,850	2,896,566	1744	71.9

Except for ratio of operating expenses to revenue, the figures are for Class I railroads.

history kept aloof from the other organizations and have refused to join the A. F. of L. The unions of boiler makers, machinists, sheet metal workers, electrical workers and firemen and oilers have members both inside and outside the railroads and together with the carmen cooperate in collective bargaining through a scheme of system federations. Outside the Railway Employees Department of the A. F. of L., the most important organization is that of the telegraphers, which is sometimes classed with the trainmen's brotherhoods. Nearly all of the unions belonging to the A. F. of L. control only a portion of the workers in their respective fields, having written agreements with a limited number of roads; this is also true in a general way of the chief miscellaneous organizations, of which the American Federation of Railroad Workers is unique by virtue of its being an industrial union. In recent years most of the unions have been united as the Railway Labor Executives' Association and are working together on legislative and other matters of common interest.

Although there were a number of railroad strikes during and after the 1850's, it was not until the depression of the 1870's that the spirit of unrest became widespread because of severe reductions in wages. In 1877 there were strikes on the most important railroads in the eastern states, which led to violence in various cities and suppression of the strikes by troops. During the 1880's the shopmen, under leadership of the Knights of Labor, conducted several successful strikes against western lines; but the last one in 1886 ended in defeat and disrupted the organization. An important strike was that participated in by engineers, firemen and switchmen in 1888 on the Chicago, Burlington and Quincy Railroad; although this strike failed, it brought such extensive financial loss to the company that for many years thereafter most lines did not dare to risk a strike, a factor which led to the gradual recognition of the trainmen's brotherhoods. The Pullman strike of 1894, involving the shopmen around Chicago who belonged to the American Railway Union organized by Eugene V. Debs, was lost largely because of the opposition of the federal government through a court injunction and the calling out of troops.

The frequency of strikes soon created a demand for legislation to aid in the settlement of labor disputes; the first such law was passed in 1888, but it was rarely brought into operation. Ten years later this law was superseded by the

Erdman Act; it covered only employees engaged directly in the movement of trains and provided for mediation and conciliation, upon application of either side to the controversy, to be followed in case of failure by an offer for arbitration by a board of three members. The Erdman Act was not used until 1906, after which it played a very important part in the settlement of a number of controversies. In 1913 it was replaced by the Newlands Act, which created a permanent board of mediation and conciliation with the power of taking the initiative in adjusting disputes; the membership of the board of arbitration was increased to six in order to lessen the influence of the neutral representatives upon the decision. The Newlands Act was instrumental in the settlement of a number of disputes, until it ceased to function at the close of 1917.

An interesting development during the life of the Erdman and Newlands acts was the use by the trainmen's brotherhoods of the concerted movement, whereby one or more of the organizations engaged in collective bargaining with all the railroads in a given territory or throughout the country. The chief objects of the concerted movements were to increase the bargaining power of the men by more united action and to bring about uniformity in wages, hours and working conditions over a wide area. All concerted movements prior to 1916 involved only the engineers and firemen or the conductors and trainmen, covering merely a single territory. In that year, however, all four brotherhoods united in a single concerted movement and demanded of all the railroads the establishment of the eight-hour day with the same pay and time and a half for overtime. The unions rejected arbitration and threatened to call a general strike if the demands were not granted. President Wilson succeeded in persuading the brotherhoods to give up the idea of punitive overtime, provided the eight-hour day was established. As the railroads refused to accept the compromise, a strike was called for September 4, 1916, and was averted only through the passage of the Adamson Law, subsequently upheld by the United States Supreme Court, establishing the eight-hour day for all employees engaged in the movement of trains.

The brief period of government operation of the railroads from the close of 1917 to the early part of 1920 marks a new era in the industry's labor relations. Whereas prior to this time the members of the powerful trainmen's brotherhoods had been the only railroad workers to

receive consideration, the government now adopted the policy of treating all workers alike; and an attempt was made to close the gap between the wages and working conditions of the men of various skills. One of the first acts of the Federal Railroad Administration was to remove all former restrictions as to membership in labor organizations, which brought about a rapid unionization of the industry. Next, the workers were given a number of wage increases in order to meet the constantly increasing cost of living. At the same time there was established the general eight-hour day with time and a half for overtime, accompanied by various other improvements in working conditions.

With the return of the railroads to private operation on March 1, 1920, the adjustment of disputes between the companies and their employees was placed in the hands of the newly created Railroad Labor Board, composed of nine members appointed by the president and representing on an equal basis the roads, their workers and the public. Its functions were to hold hearings and hand down decisions relating to wages, hours and working conditions. The board granted varying increases in wages to nearly all persons in the employ of the railroads because of the rising cost of living. However, even before this decision had been announced, the period of post-war depression had already set in. The railroads now came forth with demands not only for reductions in wages but also for the abrogation of the national agreements and reconsideration of the rules concerning hours and working conditions put into effect by the Federal Railroad Administration. Both requests were granted by the Labor Board to take effect on July 1, 1921, thus creating wide dissatisfaction in the ranks of labor. In 1922, following another wage reduction in the mechanical departments, the shop unions went out on a general strike, which was defeated with the help of the federal government through an injunction. This experience increased the opposition of the workers to the board, and soon the trainmen's brotherhoods began to disregard its existence and to deal with the railroads directly. The board became involved in a controversy with the Pennsylvania Railroad, which in spite of the former's decision insisted on dealing with its own company union instead of with the bona fide organization of labor. The case was taken to the United States Supreme Court, which decided that the powers of the board were merely advisory and not mandatory. Finally, the board

lost so much prestige that both the railroads and the employees began to make demands for its abolition. It was abolished in 1926 by the Watson-Parker Act.

The Watson-Parker Act in effect marked a return to the method of settling grievances as outlined in the old Newlands Act. The new measure provided for a Board of Mediation, which was to act in all controversies not settled within the individual roads or by bipartisan boards of adjustment, and in case of failure it was to induce both parties to submit the case to a court of arbitration of three members (or six by agreement). In case the dispute could not be settled by these methods, thereby threatening an interruption of traffic, the president of the United States was empowered to set up an emergency board to report within a specified period. The workers were not denied the right to strike. The chief obstacle to the proper functioning of the Watson-Parker law has been the refusal of the railroads to set up bipartisan boards of adjustment, so that too great a burden has been placed on the Board of Mediation and the settlement of disputes has consequently been delayed.

The 1920's witnessed the launching of several interesting experiments by the organized workers on the American railroads. One of them was their advocacy of the Plumb Plan for the industry, a form of guild socialism based on public ownership and operation by representatives of employees, including supervisory officials, and the government, accompanied by an excursion into the field of independent political action, which reached its climax during the La Follette presidential campaign of 1924. At present, although most of the unions would probably still favor government ownership, only a very few of them have retained the idea of independent political action. Another experiment was in the field of banking and investment; this was undertaken by several organizations, especially that of the locomotive engineers, but ended disastrously in nearly all cases. Lastly, there is the experiment in union management cooperation, first introduced on the Baltimore and Ohio Railroad in 1923 after the shopmen's strike. According to this plan, which now extends chiefly to the mechanical departments of several large railroad systems, both the men and the companies work together for improved efficiency, the former being given a share of the gains.

The chief problem with which railroad labor

is concerned at the present time is that of employment stabilization, involving a reduction in the weekly hours of labor with no decrease in pay and the placing of competitive forms of business under government regulation. The workers are also demanding, in the case of railroad consolidations, compensation for any consequent losses in employment and removal of homes; certain provisions to this end have been made in the Emergency Railroad Transportation Act of 1933.

In general contrast to the situation in the United States the railroad workers of most countries have shown a strong tendency to group themselves into industrial unions. Trade unionism on British railroads dates back to 1865. The progress of these unions, however, was very slow at the beginning, chiefly because of strong opposition from the companies. In 1890 the Amalgamated Society of Railway Servants led an unsuccessful strike on the Scottish lines over the question of excessive hours, but the struggle helped to focus public attention on the subject and even led to some abortive legislation. An attempt in 1896 by one of the companies to dismiss from its employ all members of unions served only to swell the membership of the Amalgamated, so that in the succeeding year it felt sufficiently strong to undertake a concerted movement for higher wages and shorter hours; the railroads, however, refused to deal with the union. In the meantime the Amalgamated became involved in the famous Taff Vale Case, according to which the courts held the union liable for the acts of its officials in a local strike. In 1907 the men renewed their concerted movement, but this time the refusal of the companies to deal with them led to a threat of a strike. The government promptly intervened and persuaded the railroads to accept a system of conciliation boards. Largely because of sabotage by the companies, it became almost impossible for the unions to obtain anything through the boards. Growing dissatisfaction among the men finally led to a general strike in 1911, in which four of the principal unions participated. Through government efforts a settlement was reached, which modified the work of the conciliation boards to provide for more rapid settlement of grievances and resulted in improved working conditions. Yet far more important than the outcome of the strike was the fusion in 1913 of three of the associations, including the Amalgamated, into an industrial organization called the National Union of Railwaymen, embracing all

crafts in the industry. Two craft unions survive, the Associated Society of Locomotive Engineers and Firemen (1880) and the Railway Clerks Association (1897).

One of the first steps taken by the newly formed National Union of Railwaymen was to join with the miners' and transport workers' organizations in forming the "Triple Alliance." Having gained recognition from the companies, it now began to demand nationalization of the railroads and a share in their management. During the World War, in order to meet the rising cost of living, the men received, with the aid of the government, successive bonuses applied uniformly throughout the country. Early in 1919 the government granted to all workers the eight-hour day without reduction in pay. There still remained, however, the problem of combining the varying basic rates of pre-war days with the uniform war bonus, so that uniform pay might be established on a national basis. Instead the government, while satisfying the locomotive engineers and firemen, surprised the other workers by ordering a reduction in pay to take effect on January 1, 1920. Evidently the government was determined to make a stand against the National Union of Railwaymen, but the latter organization went out on a general strike and was promptly joined by the Associated Society of Locomotive Engineers and Firemen but not by the miners and transport workers in the Triple Alliance. The struggle lasted for nine days, a settlement being reached through the mediation of other trade union leaders. The settlement brought about a solution of the wage question and a little later the establishment of national and local machinery for settling disputes. Since then the only other stoppage participated in by the railroad workers occurred in 1926, as part of the general strike in support of the miners affecting all labor in the country. All three unions joined in the struggle; and, although the strike was not a success, it served to show the solidarity of the railroad workers. During the past few years the chief concern of the workers, as in the United States, has been the stabilization of employment.

In Germany in 1929 the railroads had 729,838 employees. Prior to the Hitler upheaval the principal labor organization was the German Amalgamated Union of Railwaymen, an industrial body with a large membership; but there were also minor Christian, liberal and communist organizations. The chief craft union was that of locomotive drivers, which at times co-

operated with the other organizations. With the removal of the anticompetition rules on railroads soon after the revolution of 1918, the membership of the unions increased by leaps and bounds until 1922, when there set in a steady decline. The unions are now practically non-existent. Even during the republic the right of the upper grades of railroad workers to strike was virtually prohibited by the government, although the shopmen, maintenance of way men and others retained the right to quit work.

In France, where with the exception of one large system private ownership prevails, the railroads in 1926 had 524,713 employees. At present the workers are not very well organized. There is an important union comprising the majority of locomotive engineers; the rest of the men are organized only partially into two competing industrial unions, the French National Federation of Railwaymen and a rival radical organization. In 1910 there was a general strike on the French railroads, which was put down by Premier Briand through the novel means of calling the strikers to the colors. About that time a number of organizations were in existence, but in 1917 they all amalgamated into one union. The latter grew rapidly in membership until May, 1920, when another general strike ended in failure, and soon afterward the split occurred. Since that time, however, the French National Federation of Railwaymen has been making steady progress at the expense of its competitor.

Important unions of railway workers exist in Argentina, Australia, Austria, Belgium, Czechoslovakia, Holland, India, Mexico, Poland, the Soviet Union, Spain, Sweden and Switzerland, although in some of these countries the right to strike is still prohibited or subject to limitations. Their problems in general are similar to those in the countries discussed above.

The movement toward the international organization of railroad labor began in 1893, when a conference was held at Zurich and a committee appointed to inquire into conditions in various countries. In 1898 the workers on railroads combined with those engaged in water transportation to form the International Transport Workers' Federation, which showed a steady growth until 1914. During the war the federation was entirely disrupted, but in 1919 it was reconstituted with headquarters in Amsterdam. It is now one of the secretariats in the International Federation of Trade Unions and is in turn subdivided into several sections, of

which the unit embracing railroad labor, an autonomous body, is the most important. Most of the railroad unions belonging to the International Transport Workers' Federation are located in Europe. In general the federation has been very active in advancing the cause of workers on railroads in various lands, a striking illustration being its offer of assistance to the British unions during the general strike of 1926. The railroad section of the federation has been working for nationalization, freedom to organize, participation in management, the eight-hour day, installation of safety appliances and other reforms.

RAMABAI, PANDITA (1858-1922), Indian feminist and social reformer. Contrary to orthodox Hindu customs, Ramabai was taught Sanskrit and was educated to look forward to the emancipation of Hindu women, a cause which, as she grew older, became the great passion of her life. After the death of her parents in 1874 she and her brother traveled through India as pilgrims, advocating education for high caste women. In Calcutta she was received with great honor by the leaders of the Brahmo Samaj, who had already begun to work for social reform and women's emancipation. In 1880 the Pandita, a Brahman, married a Sudra, thus completely breaking all caste regulations. When her hus-

band died she went to Poona, where she founded the Arya Mahila Samaj, an organization to promote women's education and discourage child marriages; later branch societies were established through the Bombay presidency. Realizing the need for further training for her educational work, Ramabai went to England in 1883; there she became a Christian. She attended Cheltenham College and subsequently studied kindergarten methods in the United States. Her lectures and her book, *The High Caste Hindu Woman* (Philadelphia 1887; new ed. with an introduction by R. L. Bodley, New York 1901), aroused a wave of enthusiasm in the west for the cause of Indian womanhood, of which she was the chief representative; the Ramabai Association was formed in the United States to support her social work in India.

On her return to India, the Pandita established at Khedgaon, near Poona, Mukti Sadan, her famous widows' home, in which industrial and teachers' training schools were set up. At first she enjoyed the backing of Hindu reformers, such as Ranade; but when her Christian missionary zeal became manifest, this was withdrawn. Yet her social work won their highest regard and she remained the acknowledged leader of the early period of the women's emancipation movement.

RAMBAUD, ALFRED (1842-1905), French historian. Rambaud was professor of history at the University of Nancy and professor of modern history at the University of Paris; he finally entered politics under the influence of Jules Ferry, whose trusted collaborator he became. He was a member of the Senate and from 1896 to 1898 minister of public instruction. It is his historical work above all which merits attention. Rambaud was one of the first among his French contemporaries to become interested in the long neglected history of Byzantium. His *L'empire grec au dixième siècle; Constantin Porphyrogénète* (Paris 1870), by reason of its penetrating insight into historical problems and lucidity of presentation, still remains one of the most remarkable works on Byzantine history. Several supplementary articles by Rambaud on this subject are collected in his *Études sur l'histoire byzantine*

(Paris 1912, 3rd ed. 1922). Rambaud soon turned his attention to the Slavic world. In *La Russie épique* (Paris 1876) he presented an interesting study on the heroic songs of Russia, and his brief *Histoire de la Russie* (Paris 1878, 7th ed. 1918; tr. by B. Lang, 2 vols., new ed. New York 1904) is a model of clarity and precision. With Ernest Lavisse he directed the publication of the *Histoire générale du 19^e siècle à nos jours* (12 vols., Paris 1893-1901), to which he contributed several excellent chapters on the Byzantine Empire, on southwestern Europe and on Russia. All his works, which include several volumes on the history of French civilization, on the colonial expansion of France and on African problems, bear witness to an almost boundless energy, a truly superior intelligence and remarkable historical talent.

CHARLES DILLI.

Consult: Monod, G., in *Revue historique*, vol. 20 (1906) 344-48.

RAMSAY, SIR GEORGE (1800-71), English economist. Ramsay's work was lacking in originality, nor was he successful in synthesizing the often new and important ideas eclectically borrowed from others. He was without appreciable contemporary influence and has received slight subsequent notice. He is significant, however, as one of the first English writers to grasp the value of certain concepts employed by continental economists—especially Destutt de Tracy, J. B. Say and Storch—and to attempt, laudably although unsuccessfully, their transplantation to England as supplements to and improvements upon the views of the Ricardians. In his *Essay on the Distribution of Wealth* (Edinburgh 1836) he emphasized the conventional French distinction—but recently utilized by Tooke, Read and Scrope—between capitalist and entrepreneur (called by Ramsay the “master”), between interest (“the net profits of capital”) and profit (“the profits of enterprise”). He analyzed the functions of the “master,” a species of labor and risk bearing, and stressed the pivotal position occupied by him in the productive and distributive processes.

According to Ramsay a wage element, a reward for risk bearing, certain monopoly elements and “surplus gains” are the component parts of “profits of enterprise.” Wages vary directly as the demand for, inversely as the supply of, labor. Rent is originally the effect but later operates as a cause of high prices. The distributive whole depends ultimately upon the

productiveness of industry. The importance of time in production and in the determination of value is emphasized particularly. In a shrewd passage at the close of his *Essay* Ramsay warned against any policy that would make British prosperity dependent upon industrial advantages which must, with the rise of manufacturing competition in the United States and elsewhere, prove temporary. Ramsay was the author also of several unimportant works on politics, philosophy and psychology.

KARL W. BIGELOW

RANADE, MAHADEV GOVIND (1842-1901), Indian nationalist and social reformer. Ranade was one of the earliest graduates of Bombay University, where he later served as syndic and dean of arts. After holding a number of lower positions in the judiciary he was appointed judge of the High Court.

Ranade taught that the essence of India is the continuity of its traditions and forms of thought and that the true reformer must not destroy but fulfil their promise. Reform, he held, meant improvement in every aspect of life. In 1867 he formed the Prarthana Samaj, a liberal religious society similar in its theism, rationalism and eclecticism to Ram Mohun Roy's Brahmo Samaj, although it was more nationalistic than the older society and more deeply rooted in the Hindu tradition. He also participated in the nationalist movement and was one of the founders of the Indian National Congress. As an educator he tried to introduce vernacular languages into the university curriculum and he sponsored the translation into Marathi of standard English works. His *Rise of the Maráthá Power* (Bombay 1900), which deals with the first national Hindu empire, is written from a nationalistic point of view and shows marked scholarly attainments.

Ranade's name is linked especially with social service and with the introduction of European ideas in this field. He was the founder of the Indian social conference movement and wrote on India's economic and agricultural problems, the significance of which he fully appreciated. He devoted considerable attention to the social and educational problems of women and with his wife, Ramabai Ranade (1862-1924), carried on agitation against child marriage and in favor of the remarriage of widows; he likewise advocated female education and the abolition of caste

Ramabai Ranade was educated by her husband to take part in the work of social reform. She established at Poona the Seva Sadan (Home of Service), an institution for Hindu women which provided religious, literary, medical and industrial educational facilities and functioned as a center for social service work. She was actively associated with the woman suffrage campaign and is known as one of the pioneers in the women's movement in India.

RANKE, LEOPOLD VON (1795-1886) German historian. Ranke was trained in the school of classical philology and, deeply influenced by Niebuhr's critical reconstruction of Roman history, was the first to apply this method of studying sources to the modern history of almost all the important Romano-Germanic peoples and of the papacy. In his historical seminar in Berlin, founded in 1833, and in the works of his most prominent pupils (Waitz, Giesebrecht, Jaffé and Sybel) it was extended to mediaeval history.

Ranke's philosophy of history is to be derived only from a survey of all his work and not merely from his theoretical essays, for he expressed his philosophic ideas better when he wrote history than when he wrote about history. He was opposed to the tendency of Hegel and his disciples forcefully to fit facts into a philosophic system. With Savigny and Schleiermacher he was one of the pioneers of the historical school and he recognized the values of the separate empirical disciplines. Although he freed himself from his youthful Pietistic leanings, historical development always appeared to Ranke as a revelation of God. He sought neither to experience this revelation mystically nor to construct it philosophically, believing that man could merely have a presentiment of the intervention of "God's finger" into his destinies. He looked for the general "ideas" or "tendencies" of historical epochs not transcendently "behind" the world of appearance but rather panentheistically within the fully developed individual forces themselves. With the doctrine of the irreducibility of individuals or of collective individuals, as expressed in his dictum "every epoch stands in immediate relationship with God," Ranke became the father of modern his-

toricism. He remained free, however, of its relativism, because of his firm faith in Providence and in an absolute system of ethical values. As a non-dogmatic, open minded and almost supra-confessional Lutheran he also avoided Hegel's historical pantheism and idolization of the state as well as Schlosser's moralistic or Heinrich Leo's theological historical writing. He strove to apprehend historical phenomena "as they actually were" without any preconceived inclinations or evaluations and with the greatest possible objectivity. He thus sought to gauge with equal fairness the historical significance of the papacy and of the Reformation. The dominant forces in the course of history are revealed, according to Ranke, in the national and political individuality of the "great powers," each of which realizes an "idea of God." Ranke therefore applied himself to the study of the leading powers of the Romano-Germanic world. He laid most stress, however, on their universal aspects and proceeded genetically and not in a teleological dialectic manner, like Hegel. In his *Weltgeschichte* he tried to present a harmonious general picture of human civilization. Nevertheless, political history occupied the most prominent place in Ranke's works, while cultural and economic history remained in the background.

Ranke's political views were influenced above all by Gentz. They were definitely conservative and based on the concept of a national state and the idea of the continuity of cultural tradition. Through his work in connection with the organization of scientific historical work on a national basis, as in the Historical Commission in Munich and the *Allgemeine deutsche Biographie*, he contributed to the growth of spiritual national unity. He did not, however, work in any way for the more strictly political unity of Germany before 1866. Sharing the anxiety of the cultured bourgeoisie over the growing consciousness of the industrial proletariat, he showed no understanding of the social question and he greeted the events of 1870-71 as the victory of conservative Europe over the revolution. He participated actively in politics only on two occasions, both times to counteract preceding revolutions. From 1832 to 1836 he directed the *Historisch-politische Zeitschrift*, which stood midway between the ideals of French constitutionalism with its claim for absolute and international value and those of the extreme Prussian right. After March, 1848, he wrote various memorials for Frederick William IV of Prussia to strengthen the latter's resistance to the demands for popular sover-

eighty. The Young Germany movement considered him a reactionary and the Prussian school of historians looked upon him as too relativistic and restrained in his judgment and attitudes. For these reasons his scientific influence was for a time curbed. During the period between 1850 and 1880 he enjoyed a lesser renown than the more decidedly political historians, like Duncker, Droysen, Sybel, Treitschke and Mommsen. Later, however, despite the emphasis of Lamprecht on cultural history, Ranke's prestige was generally restored, as is evident in the works of Max Lenz, Hermann Oncken and Friedrich Meinecke. Outside of Germany too Ranke became the model for scientific historians.

RANTOUL, ROBERT, JR. (1805-52), American reformer and politician. Rantoul served with intelligence and zeal various humanitarian causes as a practising lawyer, lecturer and writer, as United States attorney for Massachusetts and as a Democratic member of the Massachusetts legislature and of the United States Senate and House of Representatives. A Unitarian, he was an ardent defender of Catholics against Protestant bigotry. He was a pioneer in the movement for better public support of the common schools, a friend of lyceums and mechanics institutes and a valuable advocate in the causes of international peace and temperance. His report on capital punishment (1836) influenced reform in penal legislation in several states and was widely cited abroad.

Although he was an adherent of the creed that the best government governed least and always

regarded himself as a Jeffersonian Democrat, Rantoul, witnessing the rapid growth of American competitive capitalism, soon found himself as a legislator and lawyer actively opposing the industrial and financial practises which were "fertilizing the rich man's fields by the sweat of the poor man's brow." He therefore demanded state checks on "accumulated masses of capital"; he opposed the increasing power and privileges of corporations and insisted that their abuses of the credit system and their irresponsible speculation be curbed; and he won the first victory in the courts of Massachusetts for the legal right of labor to organize [Commonwealth v. Hunt, 45 Mass. 111 (1842)]. In defending leaders of the so-called Dorr Rebellion in Rhode Island in 1842 Rantoul upheld the rights of his clients to secure elementary justice through the only channels open to them. He also championed human as against property rights by securing the condemnation of a ship engaged in the slave trade and the conviction of its master and by courageously opposing the Fugitive Slave Law. For this last he was read out of the Democratic party.

Rantoul's career, however, embodied the characteristic contradictions of middle class reformers of his age. Although he inveighed against the social irresponsibility of corporations, he was not above seeking to build up his fortune in much the same way. From 1845 to 1850, in association with other Bostonians, he tried to obtain valuable lumbering and mining rights to the lands around the headwaters of the Mississippi River; and in 1851, as representative of a group of Boston and New York capitalists, he gained from the Illinois legislature a charter for the incorporation of the Illinois Central Railroad Company, to which also a great federal land grant was to be turned over.

RAŠÍN, ALOIS (1867-1923), Czechoslovak statesman. Rašín was born in Bohemia and prepared for the bar in Prague. As a young man he took part in the secret political movement, the *Omladina* (Youth association), an activity which led to his being condemned to two years' penal

servitude (1893-95). In 1911 he became a member of the Reichsrath, representing the Young Czech party. After the outbreak of the World War a military court sentenced him to death for high treason but this punishment was commuted to imprisonment, and in 1917 he was granted amnesty. After the post-war collapse Rašín became the dominating figure of the National Revolutionary Committee and the first minister of finance of the new Czechoslovak Republic. He was assassinated by a Communist in 1923.

As the first minister of finance of the new republic Rašín had to organize a financial and currency system, since as a territorial fraction of Austria-Hungary it had no central departments of its own. Here he proved his great organizing ability. He made the banking office of the Ministry of Finance the central bank of the new state and effected monetary separation by stamping the old Austrian banknotes circulating in the republic. At the same time one half of the banknotes presented were withdrawn from circulation by means of a forced government loan at 1 percent. Provision was made for the substitution of state obligations by the imposition of a capital levy in 1920. In this way the circulation was diminished and the currency revalued. Rašín introduced the first budget of the republic and provided for the first home credit (liberty loan) and the first external credit for raw materials and food imports.

Strongly individualistic, Rašín believed in personal responsibility and, as an adherent of a productive system dominated by the entrepreneur, opposed all reliance upon the state. He separated government enterprises from the state administration and insisted upon economy. Rašín was a man of iron determination and was distinguished by candor and audacity, although his views were sometimes too narrow. The persecution he suffered during Austrian hegemony led him to employ harsh political methods. His death by violence made him a national martyr and saint and elevated the idea of well balanced finances to the status of unwritten law.

RATE REGULATION in the common usage of the term in the United States is concerned with the fixing of prices to be charged by public utilities. Usually these are enterprises furnishing transportation, communication, heat, light, power, water and the like and it is with such businesses that this article deals.

The English common law, perhaps continuing familiar church doctrine regarding the just price, gave ample recognition to the power of the state generally to control prices in the public interest. As late as the eighteenth century virtually any calling which a man pursued for profit was considered a common calling and treated as public in a sense akin to the modern. All such callings were under duty to serve the public at reasonable rates, and from time to time they were subjected to price fixing either by Parliament directly or through the delegated authority of the justices of the peace. English example crossed the Atlantic. Statutes in colonial America established prices for many of the staple commodities and services. As the economics of Adam Smith won its way in the congenial mental climate of the nineteenth century American law, however, this long experience was discredited when not forgotten, and the assumptions upon which it rested were in great part repudiated. Ultimately this reversal of opinion was written into state and federal constitutions by the lawyers and judges of the latter part of the century. The resultant contemporary separation of industry into businesses that are "public," and hence susceptible to manifold forms of control, of which price supervision is one aspect, and all other businesses, which are private, is thus a break with history. But it has built itself into the structure of American thought and law; and while the line of division is a shifting one and incapable of withstanding the stress of economic dislocation, its existence in the last half century made possible, within a selected field, a degree of experimentation in governmental direction of economic activity of vast import and beyond any historical parallel.

The survival of a few of the traditional common callings provided the nucleus from which developed by enlargement the modern category of public utilities. Chief among them was the common carrier, given new form and acquiring new importance with the perfection of the steam engine. The growth of railroads compelled legis-

lative protection of the public against extortionate tolls. This purpose was commonly given effect in conditions attached to the grant of the privilege of incorporation, following the method employed in the case of the familiar bridge, canal and turnpike companies. Thus the charter itself frequently fixed specific tolls or reserved power in the legislature to change those fixed by the carrier or, often, provided limitations upon net earnings. But such methods of control were at once too tenuous and too inflexible to meet the exigencies of a transportation system fast outgrowing all possible anticipations of the incorporating legislatures. Even before the Civil War several states paved the way to subsequent development by experimenting with rudimentary forms of continuous administrative supervision. After the war both agrarian and industrial pressures made the problem of control acute. In the 1870's legislation growing out of the Granger movement and in 1887 the creation of the Interstate Commerce Commission served to establish beyond controversy the principle of railroad rate regulation and to fix the administrative as the normal method of giving effect to it, definitely superseding rate fixing by charter or statute.

Other utilities from another beginning took a different course to a similar end. Water companies and light companies, first gas and then electricity, requiring franchises for the use of city streets, were originally regulated through franchise grants. Since their activities were confined in the beginning to individual communities, regulation by such localities sufficed. Gradually, however, the extension of the area of service by the utilities, their growing importance in economic life and the enormous power both economic and political which they exerted combined to create the necessity and the demand for more effective regulation. Meanwhile new forms of analogous public services, like pipe lines and electric power, patently beyond the reach of any but state authority, were coming under legislative scrutiny. Under these conditions the movement to establish public service commissions with state wide authority over all classes of utilities grew into one of the most significant legislative developments of the twentieth century. The issues were early made vivid by Theodore Roosevelt in the nation and such men as La Follette of Wisconsin, Hughes of New York and Dolliver of Iowa in the states. In 1907 Wisconsin and New York led the way in adopting legislation. Today tribunals of like character exist in all the states but Delaware, commonly

exercising over the utilities broad powers with respect to rates, accounts, conditions of service, finance and management.

The legal conception of a public utility was established and applied to an ever widening group of services in the face of powerful currents of both thought and action, tending to the insulation of business from government. In a society committed to the general principle of free competition the economic justification of rate regulation in particular industries has naturally been framed in terms of the exceptional conditions prevailing in those businesses. Public utilities as a class lend themselves readily to such an analysis. On the affirmative side the argument of free competition as the automatic price regulator and public protector has not even doctrinaire validity; on the negative side the practical difficulties which ordinarily surround the enterprise of governmental price fixing are of greatly diminished force. The factors limiting the effectiveness of competition as a normal regulator of prices are cumulative. Fundamental is the peculiarly functional relationship which the utilities characteristically bear to the economic order as a whole. Transportation, communication, light and power are the keystones of an integrated industrial structure, control of which is attended by extraordinary economic power. Such power lends itself to abuse and tends to be concentrated in relatively few hands. For the utilities as a group are either enterprises which move toward monopoly or those whose highest efficiency may be reached under monopolistic operation. This characteristic may be due to a variety of reasons, such as the necessity of unitary management for adequate service, as in the case of telephones and telegraphs, or the limited capacity of city streets, as in the case of most municipal utilities. Most strikingly and most generally it grows out of the huge investment in plant required in proportion to current income, the operation of that plant largely at joint cost and the consequent necessity of a large and steady volume of traffic to maintain the investment. These circumstances render complete competitive duplication of facilities improbable or impossible and make duplication, so far as it exists, wasteful and uneconomic. New competitors are slow to enter and old ones slow to leave an industry in which participation involves so large a stake. Monopoly once secured thus tends to perpetuate itself; while competition, if it exists, offers only the alternatives of combination or of destructive price cutting, designed to

maintain volume at any cost. The experience of a century with railroads, and for shorter lengths of time with other utilities, attests the abuses of instability and waste, of alternating high rates and ruthless price cutting, of inadequate service and discrimination, which follow from a regime of unregulated competition.

Similar factors create conditions especially favorable for regulation. Competitors are few; and heavy expenditure together with the usual necessity of governmental permission to engage in the business prevents mobility of entrance and exit from it. The problem of supervision and control of investment is thus simplified. Because the businesses consist typically in the dispensing of services which are not, like tangible goods, susceptible either of being withheld from the market or of flooding it, private manipulation of prices through control of supply is difficult or impossible. Hence an area is marked out in which governmental price fixing may operate effectively even in the context of an economy basically *laissez faire*.

Some such economic considerations underlie the decisions of the Supreme Court on the constitutional power of the states and the federal government to regulate rates, but the reasoning has seldom been explicit. This is due partly to the relative novelty of the problem. The earliest decision upholding a state's power to regulate rates under appropriate circumstances is scarcely more than half a century old; and the legal basis for denying it under any circumstances is only eight years older. In 1876, when the potential breadth of impact of the Fourteenth Amendment upon restrictive state legislation was as yet scarcely imagined, statutes of middle western states regulating the rates of grain elevators and of railroads were attacked under the due process clause [*Munn v. Illinois, Chicago, B. & Q. R.R.Co. v. Iowa, Peik v. Chicago & Northwestern Ry. Co.*, 94 U.S. 113, 155, 164 (1876)]. Chief Justice Waite's judgments sustaining the measures rested heavily upon the practical circumstances of monopoly and the inadequacy of normal competition to protect the public; in none of the cases did he make serious effort to mark out the limitations upon state power. But in justifying a conclusion otherwise arrived at he quoted a passage from Lord Chief Justice Hale's essay on the ports of the sea: "Looking then," Waite said, "to the common law, from whence came the right which the Constitution protects, we find that when private property is 'affected with a public interest, it ceases to be *juris privati*

only.' " By reading into this colorless statement a negative principle justified neither by history nor by the context, decisions of the last twenty years have made Waite's opinion serve a purpose for which it plainly was not intended, have authoritatively set up the verbal canon of affectation with a public interest as determining legislative power to fix prices in a particular business. The history of this development is traced by Justice Brandeis in his dissenting opinion in the *New State Ice Company v. Liebmann* [285 U.S. 262 (1932)].

The words themselves are palpably empty. Chief Justice Taft essayed definition by classifying types of enterprise within their ambit: first, businesses "carried on under the authority of a public grant of privileges which either expressly or impliedly imposes the affirmative duty of rendering a public service demanded by any member of the public"; secondly, "certain occupations, regarded as exceptional, the public interest attaching to which, recognized from earliest times, has survived the period of arbitrary laws by Parliament or Colonial legislatures for regulating all trades and callings"; and, finally, as a catchall, "businesses which though not public at their inception may be fairly said to have risen to be such and have become subject in consequence to some government regulation" [*Wolff Packing Co. v. Court of Industrial Relations*, 262 U.S. 522 (1923)]. Into the third category the court has received the businesses of insurance and of livestock and insurance brokers; it has in specific instances excluded that of vendors of gasoline, of theater ticket brokers and of employment agencies, as not then "affected with a public interest" [*Tagg Bros. v. United States*, 280 U.S. 420 (1930)]. The category is still open; nor may it be expected soon to become closed. For in essence the futile efforts at dogmatic statement of doctrine cover a clash of opinion on a far reaching issue; namely, to what degree free competition is so complete a protection to the public interest as to render arbitrary any governmental departure from it. That issue remains open and will call for continuing accommodation so long as our politico-economic system is based on individualism.

The controversy over new admissions into the magic circle of public utilities is an aspect of the general problem of price regulation. Within the circle the critical issues are different. Like every other aspect of expanding governmental activity in the United States, rate regulation has presented for preliminary determination manifold

questions involving the harmonious adjustment of power within the federal system. The most intricate of these have been concerned with railroads, for their development most palpably transcended arbitrary state lines and abstract conceptions of state and national authority. Here too, where experience has been longest and pressure for effective action most insistent, the adjustment has been worked out in greatest detail. Originally the Supreme Court appeared to sanction state regulation of interstate rates in the absence of congressional action [*Peik v. Chicago, Northwestern Ry. Co.*, 94 U.S. 164 (1876)]. In 1886 by repudiating this construction of its decision (*Wabash, St. L. & P. Ry. Co. v. Illinois*, 118 U.S. 557, 567, 569) it gave effective impetus to the passage of the Interstate Commerce Act of 1887. The movement finally culminated in the curtailment of state power even over intrastate rates. The court began by upholding in sweeping terms the states' authority to establish intrastate rates in the absence of federal action [*Minnesota Rate Cases*, 230 U.S. 352 (1912)]. But thereafter it upheld successively the power of the commission, under the original act, to set aside such rates if they discriminated unduly against particular persons or places in interstate commerce [*Shreveport Rate Cases*, 234 U.S. 342 (1914)] and the extension of its authority in 1920 to prescribe intrastate rates in lieu of existing ones discriminating against interstate or foreign commerce generally [*Wisconsin Rate Case*, 257 U.S. 563 (1922)]. The ultimate adjustment, however, has been achieved, not by the general terms of congressional legislation or in occasional explosions of litigation before the court but by the day to day work of the commission, which on the whole has exercised its plenary power with statesmanlike regard, on the one hand, for the necessities of a national transportation system and, on the other, for the desirability of harmonious cooperation between the Interstate Commerce Commission and state regulatory bodies, with a minimum of encroachment upon the latter's authority.

Effective collaborative action between federal and state administrative agencies is still unrealized in other fields. Particularly in respect to interstate power, where the situation is of comparable gravity, the utilities have for some time eluded control. The jurisdiction of the receiving state over retail distribution has apparently been recognized [*Pennsylvania Gas Co. v. Public Serv. Comm.*, 252 U.S. 23 (1920); compare *East Ohio Gas Co. v. Ohio Tax Comm.*, 283 U.S.

465 (1931)], but over wholesale distribution it has been definitely denied [*Public Utilities Comm. v. Attleboro Steam & Elec. Co.*, 273 U.S. 83 (1927); *Missouri v. Kansas Natural Gas Co.*, 265 U.S. 298 (1924)]. Meanwhile effective exercise of authority has been hampered by multirarious difficulties in obtaining adequate information and enforcing decisions, arising especially from confusion of intercorporate relations. In *Smith v. Illinois Bell Tel. Co.*, [282 U.S. 133 (1930)], however, the court indicated how intercorporate interests might be divided for the purpose of bringing them under different regulative authorities. Control by the Federal Power Commission reorganized in 1930 is confined to licensees of federal power sites, and the provisions of the act of 1920 looking toward federal and state cooperation have yet to bear substantial fruit in action. Legislation is bound to enter this field with more comprehensive control.

Of a wholly different nature from problems of jurisdiction but of no less moment are the issues of constitutionality centering around procedural and substantive aspects of the rate fixing process itself. These are issues of conformity to whatever may be the requirement drawn from the due process clauses of the Fifth and Fourteenth amendments and they exist only because of the decisions of the Supreme Court. The earliest of these decisions disclaimed all concern with such questions. If the rate "has been improperly fixed," said Chief Justice Waite, in first sustaining railroad rate regulation, "the legislature, not the courts, must be appealed to for the change" (*Peik v. Chicago, Northwestern Ry. Co.*). But this judicial self-abnegation did not long survive the pressure of distrustful property holding groups soliciting protection from unrestrained legislative action. There were several warnings of a different view, and in 1890 the court definitely adopted the position that "if the company is deprived of the power of charging reasonable rates for the use of its property, and such deprivation takes place in the absence of investigation by judicial machinery, it is deprived of the lawful use of its property, and, thus, in substance and effect, of the property itself, without due process of law . . ." (*Chicago, M. & St. P. Ry. Co. v. Minnesota*, 134 U.S. 418).

This step was scarcely less important in procedural than in substantive law. The court did not stipulate, and it never has stipulated directly, any particular procedure in the fixing of a rate as an essential of due process. But it was indispensable to the success of the administrative

method that the party demanding "investigation by judicial machinery" should not be able to compel every step in the administrative process to be retraced afresh in court. Questions of law must be reexamined by a judicial tribunal. Questions of fact, the Supreme Court holds, need not be so reexamined if, but only if, the administrative procedure conforms to elementary fairness, without which judgment becomes arbitrary. The tribunal must grant a proper hearing to the parties affected; it must decide upon the evidence presented at the hearing, and there must be evidence in the record to support its findings. In the enforcement of these standards the courts—primarily the Supreme Court—have at once strengthened the essential administrative arm of government and protected private individuals against its arbitrary conduct, besides having evolved empirically a body of administrative law relevant in other fields of governmental activity. In one important group of cases, however, the court seized for the judiciary power that plainly belongs to the administrative experts, if they have any *raison d'être*. In *Ohio Valley Water Company v. Ben Avon Borough* [253 U.S. 287 (1920)] it decided that in rate controversies involving the issue of confiscation due process of law required that administrative findings of fact be open to independent reexamination in a court. This doctrine may be accounted for by judicial distrust of the non-judicial determination, even indirectly, of issues of constitutional right; by the extent to which in rate proceedings questions of law turn upon questions of fact; and above all by the vast interests that are at stake and the distrust of governmental curbs to big business at the time a divided court rendered the decision. In practise a genuinely independent judgment by the court is almost impossible by reason of the multitudinous details and their recondite significance; yet the *Ben Avon* case remains a sword of Damocles hanging over the regulatory systems, especially those of the states.

But it is in giving content to the substantive limitation announced in the early Minnesota rate cases that the Supreme Court has most decisively influenced the course of rate regulation. By that decision the court projected into every rate proceeding, state or federal, a potential issue of the denial of due process of law as guaranteed by the Fifth and Fourteenth amendments. The issue was of a character unfamiliar to the courts; save for the simple and scarcely adequate concept of reasonableness, the common law fur-

nished no canons for determining when the rates which a utility was permitted to charge had been reduced to the point of confiscation. The opinion in the famous case of *Smyth v. Ames* [169 U.S. 466 (1898)] gave the first indication of how the court was going to attack the task of formulating such canons. The court undertook to measure the reasonableness of rates to be charged by a utility by inquiring into the return which they yielded; and it set out to determine the fairness of the return by inquiring into the value of the property which was used to earn it. Later decisions have brought into sharper focus another element of the decision, have made clear that in speaking of "the fair value of the property being used for the convenience of the public" the court meant the present value of that property. Out of this effort to tie rate regulation, as a matter of constitutional right, to a perennially shifting and inherently unstable rate base have flowed the most troublesome of the problems which ever since have beset the courts and the commissions. By a process of self-delusion not uncommon to judges when casting grave issues of public policy into the mold of law, the court seemed unaware that it was trying to formulate into legal principles and doctrines what were really determinations resting largely in opinion quite outside the orbit of judicial insight or experience.

Justice Brandeis, whose concurring opinion in the *Southwestern Bell Telephone Company* case [262 U.S. 276 (1923)] is the classic refutation of the doctrine of present value, explained its emergence in terms of the conditions following the panic of 1893. "Watered stock, reckless financing, and unconscionable construction contracts" had created fictitious capital values far in excess of those on which the shippers believed the railroads should be permitted to earn a return. At that time supervised accounting and financing had not yet been introduced to provide reliable proof of actual cost and investment. Accordingly, in *Smyth v. Ames*, William Jennings Bryan as counsel, representing shippers in agricultural communities, urged upon the court estimates of the present value of the railroad properties, which in a time of low prices were estimates of reproduction cost. A different explanation, however, must be sought for the Supreme Court's continued adherence to a rule thus established under conditions which no longer obtain. Basic was the conviction, rooted in attitudes toward the social justification of the stimulation of investment through its amplest

protection, that utility investors should not be deprived of the benefit from appreciation of capital incident to investment in all other enterprises. The test of present value has been defended as a flexible instrument of accommodation to changes in the price level, doing equal justice to the public and the utility owners and making possible the attraction of new capital.

The determination of utility rates and the ascertainment of the rate base are essentially economic problems. But no judicial pronouncements upon matters fundamentally economic run so counter to the views of economists as do the predepression utterances of the Supreme Court upon present value. The theoretical unfairness of the doctrine has been repeatedly pointed out, for common stockholders benefit out of all proportion from increases in the price level appreciating the value of the entire property, whereas holders of bonds and preferred stock bear the risk of decreases without corresponding possibility of gain. Most conclusively, however, is the doctrine condemned by experience; the test of thirty-five years has powerfully demonstrated its unworkability. The Supreme Court itself has as yet been able to furnish no calculus of present value; and it becomes increasingly clear that none can be furnished, for uncertainty inheres in the standard.

The consequence has been, in every important rate fixing proceeding, a preoccupation, lasting sometimes for years, with contention over fanciful elements in quest of a rate base; that is, a supposedly objective mathematical ascertainment, in fact illusory, of the amount on which the allowable rate of return must be fixed. This procedure has entailed an incredible waste of time and money and inevitably embittered relations between the utilities and the public. Thus in a leading valuation controversy in New York over telephone rates the litigation began before a commission in 1920 and went its snail-like pace through the federal court until 1930. Half a dozen estimates of value—by the commission, the master appointed by the court, the court itself and the company's experts, all purporting to apply the Supreme Court's formula—ranged between \$366,000,000 and \$615,000,000. A similar case in Chicago was in the federal courts for more than ten years and had not been concluded at the end of 1933. In the latter case it cost \$25,000 to print the record of the proceedings for review by the Supreme Court. The whole process is fundamentally an elaborate fiction. In the end rates are fixed which reflect

no other reality than that of compromise, reenforced partly by the superior advantage of the utilities in litigation.

Actual cost, capitalization, prudent investment, cost of reproduction either of the existing plant in present use or of a modern plant giving equivalent service, these and many other elements have been pressed for consideration in diverse cases involving rate bases, and in various situations the propriety of all of them has been recognized. Necessarily the formula depends upon particular conditions: the past, present and probable future level of prices, the history of the company and the conditions of its property. No formula can survive serious changes in these elements of the problem.

Dominant effect, the court has indicated in a series of decisions antedating 1932, must normally be given to reproduction cost. To ascertain the expense of constructing a railroad, a power plant or a telephone system in the midst of a community which could have no existence without them is to operate on an unreal hypothesis and requires calculations upon assumptions foreign to human experience. It is not surprising therefore that the Supreme Court has never provided the commissions with workable intellectual tools for making the determination. The so-called rules constitute a maze; their operation in practise descends into a process of economic legerdemain whereby those who control utilities through narrow equities are enabled to seek constitutional sanction for speculative gains.

Nor has it proved to be true that the rule of present value provides a means of flexible adjustment to changing price levels. The process of valuation is too ponderous to permit flexibility under any circumstances. In practise moreover initiative in rate proceedings is more often taken on behalf of the utilities than of the public; the hands of the commissions are variously stayed in beginning actions for reduction, by lack of time, money, will or authority. More important still, in times of depression the doctrine of present value will not bear a rigid application in favor of the public. A deflated price structure is not responsive to the assumptions of a theory sedulously cultivated by the utilities during high prices; it produces a theoretical base too low to permit fixed charges, assumed at higher levels, to be met—the more so because decreasing traffic raises operating costs and earnings shrink even under existing rates. Thus while, obedient to theory, rates may rise with prices when business prospers and profits swell

with heavier traffic, under opposite conditions they fall less rapidly or not at all.

For all these reasons the practical result of the control evolved by the Supreme Court over rate regulation has been to put the constitution behind the right to earnings on utility investments, to an extent that contradicts the very basis on which governmental intervention rests. Indeed the judicial doctrine of valuation sanctions what the utilities themselves, as a matter of business, cannot practise. As a matter of "good business judgment" utilities commonly charge rates which, if established by the commissions and attacked in the courts, would be declared confiscatory and unconstitutional under the doctrine of a reasonable return on present value. On the other hand, as the point of confiscation drops with falling prices, utility rates habitually lag far above it, subject only to delayed and intermittent attacks by public authorities, the basis of which is liable to be destroyed at any time by price recovery. The depression which began in 1929 is replete with proof of this experience.

The difficulties with the method of determining the rate base, as developed under the rule of *Smyth v. Ames*, have their counterpart in the attempt to determine what is a reasonable rate of return. For by similar reasoning the utility is entitled to a return at a rate determined by the present condition of the money market, without regard to the price actually being paid for capital already invested. Hence common stock dividends, already swollen by inflated valuation, may benefit doubly from allowance of a higher rate of return. Similar uncertainty too beclouds the method of computation. Although the Supreme Court has indicated that the rate should be that generally ruling investments of comparable risk at the same time and place, the usual practise in rate cases is to submit opinion testimony by bankers or other persons as to the rate currently necessary to attract new capital, a test which in times of business stress may lead to an altogether different result. Since 1929, however, several federal district courts have upheld rate reductions ordered by commissions, holding that a fair return in times of depression should be calculated at a lower rate than in periods of prosperity.

Questions concerning the rate of return are, however, overshadowed in practise by controversies about valuation and the rate base, where the opportunity for inflated claims is greater. The reluctance of courts to recognize directly the necessity of a relatively high rate of return

has contributed also to their willingness to permit adjustment of the rate base to serve in part the function of adjustment of the rate of return. The two problems are inextricable; a workable technique for computing fair return must await satisfactory determination of the elements to be considered in computing fair value.

The importance of the constitutional aspects of rate regulation is the greater because they in effect control proceedings not only in the courts but before the commissions. In theory the duty of a commission under the statute is to set a reasonable rate, and between the statutory standard of reasonableness and the constitutional one of confiscation there may well be a substantial margin. In practise, however, the line of confiscation is likely to be so high that the pressure of circumstances, and not least the desire not to run foul of the judiciary, will be to set the rate as near that line as possible.

But the problem of confiscation has only to do with the general level of rates. That level being fixed to allow a fair return on the property as a whole, administrative considerations have freer play in the determination of particular rates. It is here that rate regulation has achieved its most substantial accomplishment and has amply justified itself. Particularly in the case of railroad rates, which have been regulated far more minutely and effectively than those of other utilities, the most intricate problems concern the adjustment of tariffs for different commodities and hauls. In the making of these adjustments the Interstate Commerce Commission and the several state commissions exercise vast powers over the development of communities and industries. To a lesser degree similar problems and similar interests attend the adjustment of differentials in telephone and telegraph rates and rates for light and power. Joint costs being high and accurate allocation of costs to particular services impossible, the controlling considerations tend to be the assurance of adequate service throughout the area as a whole, without regard to loss at particular points, and the fullest possible promotion of the economic development of the entire community. Moreover the constitution cannot be invoked against state policy in treating a localized part of a larger system as the unit in determining the rate base [*Wabash Valley Elec. Co. v. Young*, 287 U.S. 488 (1933)]. In such conflicts among groups of consumers the inclination of the courts has been strongly toward accepting the administrative judgment. And while discrimination in rates was originally a

dominant factor in the movement for regulation, particularly in respect to railroads, similar complaints are now of comparatively minor importance.

The adoption of the modern machinery of utility rate regulation during the decade prior to the World War was accomplished upon a wave of popular enthusiasm. In the post-war decade, however, skepticism and discouragement tended to supplant the earlier feeling of hope. Particularly in the leading industrial states criticism was voiced against the failure of utility rates to reflect decreased operating costs due to technological improvements, against the costly futility of rate proceedings and against failure of the commissions to exercise skilled initiative in the promotion of the public interest. Conviction has been gathering that the regulatory systems do not realize but even operate to defeat the aims for which they were designed. This change of temper is no doubt partly a reflex of the different price levels obtaining before and after the war. When the commissions began to operate, rates were widely believed to be unreasonable; some measure of success at first attended the efforts to secure their reduction. With the great rise in prices after the war the commissions became more often instruments for the increase of utility rates than for their decrease. Dissatisfaction with the workings of the system, however, has still deeper roots. In a wide variety of concrete instances the machinery of utility regulation has shown increasing strain. Revealed shortcomings in administration and legislation and in the judicial doctrines to which they are required to conform have been accentuated by the stress of new economic forces and by the ingenuity of the utilities in devising unanticipated means of eluding effective control. Beyond question successful regulation cannot be achieved upon a permanently unstable and incalculable rate base.

The difficulties inherent in the methods imposed by the judiciary upon administrative agencies have been intensified by the quality of their personnel. Almost everywhere the commissions have been inadequately staffed, overburdened by detail, denied necessary technical aid, dependent on meager salaries and without security of tenure. The hope behind public utility legislation during the era of Theodore Roosevelt was a body of administrators intellectually as well equipped as the higher officials in the British Civil Service and exercising independence and authority comparable with that en-

joyed by judges in the United States. A few men, like John M. Eshleman of California, George W. Anderson and Joseph B. Eastman of Massachusetts, Milo R. Maltbie of New York and David E. Lilienthal of Wisconsin, vindicated that hope. But in the main the public interest has suffered from too many mediocre lawyers appointed for political considerations, looking to the Public Service Commission not as a means for solving difficult problems of government but as a step toward political advancement or more profitable future association with the utilities. As a result there has been inequality in expertise, in will and in imagination between the utilities and the regulatory bodies. Thus, with only a few notable exceptions, the utilities have commanded the services of the best of the engineering profession on those technical issues which are so central in valuation controversies.

Nor has legislation been adequately responsive to the shifting exigencies of the problem. Many commissions lack adequate authority in various directions: they cannot enforce proper accounting methods, initiate proceedings for rate regulations, compel disclosure of essential information, inquire into the hide and seek mysteries of intercorporate relations. Especially have the efflorescence of the holding company and the organization of auxiliary companies for management, construction, purchase and finance created intricacies of technical ownership and practical control before which the investigating authority has often been helpless. Yet these very devices serve powerfully to sustain schemes for inflated values. These difficulties have been further enhanced by expansion of activity across state lines, so that effective legal control falls too frequently between the two stools of state and federal authority.

Pessimism as to the future of rate regulation, however, has nowhere been so profound as to suggest return to unregulated private enterprise; rather it has contributed to the impulse in quite the opposite direction, that of public ownership. To be sure, this development, even in the face of grave abuses and growing discontent, encounters the obdurate and stimulated traditions of the United States against government in business. On the other hand, government ownership as a yardstick gives every assurance of being powerfully promoted by the Tennessee Valley Authority. The reactive effect of this government enterprise upon electric rates of private companies has already made itself felt. To the extent that public opinion will not be

won to public ownership strengthening of the existing regulatory system is plainly indicated. Another mode of accomplishing the old objectives of utility regulation is by contract arrangements between municipalities or states and grantees of public franchises. Whatever the forms of the attempted solutions, problems of utility rate regulation—so long as private enterprise survives—are at once the epitome of crucial and characteristic issues of contemporary government and the test of its resources. Not until those resources, as to both men and method, have been explored far more patiently, persistently and imaginatively than they have been, will anything approximating a final verdict upon the undertaking be feasible.

RATHENAU, WALTHER (1867-1922), German statesman and social philosopher. Rathenau was the son of the famous German-Jewish industrialist, Emil Rathenau, the founder of the Allgemeine Elektrizitäts-Gesellschaft (A.E.G.). Although he was active in business and succeeded his father as head of the A.E.G., he is known primarily as a social theorist and political leader. In the early days of the World War he foresaw the possibilities of a long struggle and was entrusted with the organization of the supply of raw materials. He was opposed to Germany's surrender in 1918 and favored a call for a *levée en masse* as a last stand against the Allies. After the founding of the republic, however, he became the leading exponent of the so-called "policy of fulfilment" according to which Germany should comply with the reparations obligations of the Versailles Treaty but continue to expose the utter impossibility of carrying out the treaty in its entirety. Rathenau occupied high posts under the republic, represented Germany at various important international conferences, negotiated the important Rapallo Treaty with Russia in 1922 and greatly increased German prestige during the post-war period. But his personality as well as his success brought him dangerous enemies, and he was assassinated on June 24, 1922, by members of a nationalist terrorist organization.

As a social theorist Rathenau was interested in problems of foreign and domestic policy, of economics and of social development, and was profoundly concerned about the dangers to European culture entailed in industrial development. Like many of his generation he developed a skeptical attitude toward progress and an opposition to the mechanization of labor. He deplored this mechanization with its specialization

and abstraction, stereotyped thinking and complicated uniformity as the characteristic mark of the age. A second point which dominated his thought was the problem of selection. Rathenau was of the opinion that the economic system under high capitalism was becoming sterile because it was dominated by an oligarchy, even more exclusive than the older aristocracy, which did not understand how to recognize and utilize the talents inherent in the people.

Rathenau's social theories represented a mixture of conceptions of a new social order with certain romantic notions; he believed that improvement in general welfare was to be achieved by means of efficient economic organization. He was a leading exponent of economic planning to be carried out by the common action of the various economic organizations. His views were a reflection of the economic organization developed during the war and were influenced in large measure by von Möllendorf. At the time he could not envisage the enormous potentialities of modern technical advancement and therefore considered socialism as identical with general poverty, although he conceded that its principle of equality had a high ethical value. He held that the distribution of well being was a matter for social legislation. Redistribution, which would restrict private property only to consumers' goods, was to be carried out by taxation and radical reform of the inheritance laws. A logical consequence of this demand was the removal of the entrepreneur. According to Rathenau's later views industry was to be administered by guilds in which all groups of producers and consumers were to be represented. The aim of this economic system was to increase responsibility by instilling a new spirit into labor. By the elimination of the entrepreneur and the establishment of guilds for the individual branches of the economic system a solidarity, a feeling of achievement and a sense of responsibility for the general welfare could be attained which would compensate for egotistic instincts and the despair which resulted from the absence of spirituality in work.

Rathenau's social philosophy was thus essentially pessimistic. What he pictured was the same social set up without the rich: a society of sorrowful monotony with no cultural productivity or intrinsic value. Since there would no longer be any wealthy upper class, art would disappear. Rathenau did not perceive that a radical reconstruction of society would also involve the transformation of the relation between

creative and receptive groups, as may be observed, for example, in Soviet Russia or in a comparison between feudal and bourgeois society.

Rathenau was a man of many contradictions. He was attracted toward the simple, instinctive and non-intellectual—the "Prussian." Essentially, however, he was a typical intellectual, subjecting all his observations to his reason. He was never at peace within himself but always at the mercy of his desire to "be different." These contradictions, however, were due mainly to his sensitive nature, which reflected all the vital tendencies of the troubled age in which he lived. To do full justice to his rich personality would really require the full analysis of the history of this period.

RATIONALISM is a comprehensive expression applied to various theoretical and practical tendencies which aim to interpret the universe purely in terms of thought, or which aim to regulate individual and social life in accordance with principles of reason and to eliminate as far as possible or to relegate to the background everything irrational. Rationalism has played a fundamental role in the rise of general philosophy, which, as expressed in the great metaphysical systems, represents an effort to conceive the world as a coherent structure analyzable by human reason. Rationalism has also exerted a decisive influence upon the development of science by establishing the logico-mathematical approach to nature and by setting up the problems whereby this approach could be carried through rigorously in all fields. In individual and social life rationalism seeks to establish universal and self-evident principles for the regulation of human behavior. Rationalism here signifies the effort to rationalize life.

Rationalism always takes its starting point from the fact that in our original intuition of things and events reality presents itself as something irrational. What confronts us at first is the sense intuition, the chance alternation of impressions and events, the natural and instinctive manifestation of life. It is against this original intuition that the rational approach to reality has to assert itself. Of course it is not given to reason to eliminate the irrational altogether. The task of rationalism is rather to be always recommencing the struggle against everything that is recalcitrant to reason. In the realm of theory rationalism rejects "the appearances of the sense world"; in the realm of practise it seeks in various ways to grapple with the elements of chance and fate in individual and social life by combating the instinctive in man and submitting to criticism everything in social life bearing the character of mere custom and tradition and recalcitrant to generalizing, rational reflection.

In social and historical life the power of rationalism derives from the confidence which individuals and societies place in reason. This confidence is an experimental confidence born of the success or failure of human beings in their efforts to arrive at a rational knowledge of the universe and a rational regulation of individual and social life. Sometimes the irrational forces displayed in nature and life give the impression of omnipotence and human reason becomes conscious of its frailty. Sometimes, on the other hand, man is struck by the power which reason manifests in scientific knowledge and in the ordering of the various relations of human living, and he becomes permeated with the feeling that the human mind is sovereign. In the course of history the relationship of the rational to the irrational or superrational undergoes various transformations. The irrational which reason has to conquer manifests itself now preponderantly in the world of sense, now in the forces of chance and fate displayed in individual and interindividual life, now in human nature itself and now in the sequence of historical events. Rationalism, even though it starts out from universal and immutable principles, must therefore also change its attitudes and methods, modifying its tactics in accordance with the various forms which the irrational assumes.

Greek rationalism was directed above all against the sense world. In contradistinction to the world of changeable appearances, reason was supposed to attain to true being by means of

immutable concepts. Reason and being became parallel terms, for reason grasped the objective and thinkable elements of the cosmos. In this way metaphysics assumed the form of a rational science, a science dealing with everything that remains self-identical throughout all temporal changes. Aristotle developed in his logic the forms of thought which were to enable man to arrive at this rational and objective knowledge of reality. Human reason and world reason found their unity in divine reason, which was the origin of both. In this scheme there remained outside the pale of reason only the world of change, which included also all individual differences. Since reason was confined to the sphere of the typical and the recurrent self-identical, it was regarded as incapable of extending its sway to the multitude of events that take place in individual and social life. Human life, especially its individual significance, could not be deduced from rational regularities. This did not mean that reason had no voice in human life. For in addition to theoretical reason there was also for Aristotle a practical reason. None the less, Aristotle was always concerned with a knowledge of what ought to be rather than with an attempt to bring about a rationalization of life itself. The Socratic ethical rationalism, which is typical of the rational attitude of the Greeks toward life, centered in knowledge rather than in the will.

It was only under the influence of the Roman spirit that a synthesis of reason and will became possible. In the Roman world view reason became a force in individual and political life. The objective and contemplative rationalism of the Greeks now gave way to a rationalism of the will that was oriented in practise. Reason became an instrument for the control of life. Of foremost significance in this connection was the theory that moral and rational insights were natural to all human beings. These insights, or judgments, were supposed to meet with the approval of every thinking being; they were valid for all times and all nations. This theory was the source of the idea of a universal legislation conceived as the basis of a political and social world order. Popularized and passed on by Cicero, such conceptions continued to supply—until far into the eighteenth century—the basis for a practical rationalism which found its expression in social life.

Side by side with the Greek idea of a cosmos subject to rational conceptualization we thus have here the view of a divine world empire

regulated by the universally valid laws of reason. These laws, however, were primarily of a legal and formal nature. They supplied the criterion for distinguishing in all human relations what was right from what was wrong. But since reason in this function was unable to shape human life so as to eliminate everything irrational and to dominate the elements of fate which defy rational regulation, the individual began to look for a place of refuge in his own self. For this purpose it was necessary that the individual's rational insight should dominate his passions. Thus there developed the ideal of the stoic wise man, the man who is guided by reason and who in the face of the vicissitudes of external life asserts the freedom of his independent and self-contained personality.

This confidence in the power of reason, so characteristic of stoic thought, disappeared in the Christian world view. St. Augustine maintained that the instincts and will had an independent existence and nature, and were not submitted to the control of intellect and reason. As a result of the fall man was unable to carry out decisions in accordance with rational insight. This proved for him both the impotence of human reason and the necessity of divine grace. In mediaeval Christianity there developed therefore a new conception of life. Human life was now conceived as a meaningful whole revealing the presence of a divine plan. Since human history was governed by divine Providence, its meaning could never be grasped by rational insight. Only divine revelation could disclose the plan of the whole and hence the meaning of life could be understood only from the point of view of religion, never from the point of view of rational thought, which remains in the realm of the permanent and the self-identical. How could reason deal with such a temporal occurrence as the story of redemption, which depends on the will of God and which determines the life of all mankind? There was thus necessarily imposed upon the conceptual system of antiquity a historical and religious superstructure expressing the superrational meaning of life.

This dualism, which found its clearest expression in Thomas Aquinas, was in the last analysis grounded in the mediaeval conception of God. God was conceived at once as intellect thinking only what is eternal and universal, and as will, expressing Himself in the temporal acts of the story of redemption. An insight into the decisions of God's will remained, however, outside the pale of human reason. This super-

rational voluntarism reached its most logical development in Ockham.

The belief in a superrational and purposeful interpretation of human life disappeared in the Renaissance as a result of the disintegration of the traditional religious views. The idea of divine Providence again gave way to that of the Fortuna of antiquity. The irrational, unpredictable and capricious elements of life found expression in the literature and philosophy of the time. The individual again fell back upon himself, looking for repose and security in the development of his individual reason—the one means for escaping from the tumult of life. The stoic philosophy of life again came into vogue.

On the other hand, the man of the Renaissance was also permeated with the consciousness of the multiplicity of things and events defying rational regulation as well as with a sense of the infinity of possibilities disclosing themselves to him. There was awakened a new sense for the particular, for the meaning of the individual phenomenon as such. The traditional forms of rational thinking—designed as they were primarily for the reduction of the individual and the changeable into something universal and permanent—proved therefore insufficient. What was of paramount concern now was rather the use of rational principles for organizing and regulating the multiplicity of the visible world. One was no longer interested in reducing things to conceptual patterns but rather in interpreting occurrences in the world of phenomena in conformity with rational laws. Types, ideas, forms, gave way now to functions, motions and laws about the interdependence of occurrences in the universe; the static and conceptual classification of things in higher and lower orders gave way to laws of dynamic causal connection; the emphasis on being gave way to an emphasis on events.

In this way there developed the constructive and scientifically oriented rationalism of the seventeenth century. Its basis was furnished by mathematics, which became the rational science par excellence; the chief concern of the philosophers was now to mathematize the universe by means of a projected "universal mathematics." Formulated first by Galileo, this universal mathematics became the foundation of the speculative systems of Descartes, Spinoza and Leibniz.

The same constructive and rational method now began to be applied in a parallel manner in the social and political field. Here the problem

was to rationalize human social life on the basis of self-evident and universal principles. The state was made into an instrument of reason for the control of individual arbitrariness and for settling the conflicts between the irrational instincts of the members of the group. Here too, exactly as in the rationalism of natural science, it was the law which supplied the fixity and the security; and whatever was individual, contingent and empirical was subordinated to the law. But while in nature the determinism of the individual phenomena by a system of universal laws was a fact, in social life the supremacy of the universal and of the rule over against the particular and the arbitrary was an ideal to be realized.

This striving for the rationalization of social life found its expression in the great empire states. In them the various domains of human life were regulated by definite principles on the basis of the decisions of a single sovereign will embodying the so-called *raison d'état*. This rational regulation, however, was able to cope with the irrational only to a limited extent. Individual life under this scheme proved insusceptible of rationalization. It was only in so far as the individual submitted to the reason of the state that he acted in conformity with a rational order. As soon, however, as he followed his personal insights he was regarded as succumbing to the arbitrariness and irrationality of instinctive life.

In the eighteenth century a new attitude became manifest. It was now the autonomy of the will that was stressed. The man of the middle classes learned to shape life rationally on the basis of his own foresight. No longer was the rationality of the political order opposed, as it had been by Hobbes, Bossuet and Spinoza, to the irrationality and arbitrariness of individual instinctive life, on the contrary, the compulsion exerted by the authoritarian state upon the newly won individual freedom was now regarded as an arbitrary act rationally unjustifiable.

Thus did reason come to play a new role in political and social life. In the seventeenth century reason was regarded as a sovereign power not dependent upon individuals and centering in the will of the state. In the eighteenth century, on the other hand, it was looked upon as a product of the cooperation of free individuals, as a collective expression of all the independent rational manifestations displayed by every member of the state. The private spheres of individuals were not interfered with but were left

to the rational self-regulation of the individual himself. Also whereas in the seventeenth century a far reaching system of regulation was applied to economic life in order to curb individual arbitrariness, in the eighteenth century the tendency was to grant as much freedom as possible to the economic activities of individuals so as to enable the individual manifestations of reason to assert themselves to the fullest extent. In this the underlying presupposition was the belief that the various economic actions of individuals tended toward a natural harmony, and it was precisely this harmonization of interests which was regarded in the seventeenth century as the proper task of political reason, or statesmanship.

There are thus essential differences between the rationalism of the seventeenth century and that of the eighteenth century. In the former period reason was regarded as a compulsory force imposed from above; its task was to curb the various irrational and instinctive manifestations of individual life and to coordinate them in such a way as to make social life possible. In the latter period the prevailing attitude was that of confidence in the rational endowments which were proper to every individual, and which were to be developed through education and enlightenment.

Different as was the seventeenth century rationalism of authority from the eighteenth century rationalism of freedom, they both shared the belief in the eternal truths of reason as originally developed in the doctrine of the stoics. In the nineteenth century, however, the validity of such timeless truths for historical and social life began to be questioned. The historical consciousness which now came to the fore laid emphasis upon the temporal and relative character of all social and cultural realities. Burke and the romanticists awakened a sympathetic understanding for those forces in the development of social life which cannot be grasped rationally. But Hegel in his turn gave a new expression to the rational point of view. Reason was conceived by him not as a system of ideas given once and for all but as a process of thought realized in the course of history. Hegel rationalizes history to a certain extent, thus endeavoring to win for rational understanding a field which had long been regarded as the very realm of the irrational or of the superrational.

In the twentieth century a new tendency made itself felt. In contrast with the seventeenth century faith in the rational foundation of the

natural sciences, stress began to be laid now upon the fact that the sciences contained elements not amenable to rational human thought. Similarly in the sphere of economic life there was an undermining of the trust in a "natural harmony" of interests, uncontrolled from above and guided only by the autonomous reason of the individual members of society. The emphasis now seemed to be placed rather on attempts to rationalize the relations between the various individual economic activities. This active rationalism is reminiscent of the rational tendencies of the seventeenth century, which sought to organize and control economic life, rather than of the liberal rationalism of the eighteenth century. Great significance, however, was now attached to the eighteenth century idea of an economic interdependence upon an international basis. But it is important to note that this international relationship was not expected to emerge spontaneously on the basis of a natural order; it was rather to result from an active rationalization of the economic order.

RATIONALIZATION, in the social sphere and broadly conceived, is the application of purposeful ratiocination to political and economic

ends. Machiavelli's *Il principe* is an early theoretical attempt at social engineering, and Colbertian mercantilism represents the first modern application of such planning to economic policy. Liberal individualism set up individual rather than collective action as the basis for economic organization: rationalization was to be achieved through competition and the struggle for profits. The Manchester school broadened the idea of rationalization by applying it to politics. A rational international division of labor was to be made possible by the suppression of irrational components, such as lust for or fear of power; but its failure to prevent wars forced industrialization on countries not fitted for it. And war, although its success depends on rational technique and organization, negates the working of the competitive system, paralyzing the free flow of goods and labor and necessitating the rationing of consumption and the coordination of production through coercive planning. Such rationing occurred during the World War on an unprecedented scale, with the result that the idea and the machinery of collective rationalization have played an increasing part in the economic life of the post-war period.

The term rationalization was first popularized in Germany, where indeed it became a catchword for any and all forms of industrial reorganization. Scientific management and industrial combination were to be merged into a new system of industrial organization. This conception of rationalization—well set forth in the writings of Walter Rathenau—was based upon a combination of socialistic theories as to the benefits of centralized production, military necessity and the monopolistic interests of big business. It relied upon the fact that competition is wasteful in so far as small units, making differentiated articles, incur higher costs than large units turning out standard goods. Large scale production and integration by vertical combination are cost saving, if cheaper manufacturing is not offset by wasteful financing (watering of stock). These advantages were frequently imputed also to cartels and syndicates, incorrectly, however, since these forms of organization are essentially anti-rational, their object being the maintenance of profits of individual "uneconomic" enterprises. When inefficient producers are wiped out by the pushing of prices below marginal costs, capital investments are totally or partially destroyed; if such enterprises are bought at a nominal price by new entrepreneurs, the capital of the erstwhile successful rivals may also be

threatened with extinction. Cheapness is thus secured by a continuous destruction of capital. The term rationalization has also been applied all too often to the formation of monopolistic combinations to maintain prices, through reduction of output if necessary, although such monopolies merely shift the cost of overinvestment to consumers and fail to prevent or eliminate waste.

The most obvious form of rationalization of production methods, mechanization, was practised in the United States as a result of labor scarcity long before the term was coined. Labor saving machinery was devised for backward immigrant labor, division of labor perfected and even the moving belt used (in the packing industry) many years before it was made fashionable by Henry Ford. Frederick Taylor and his followers applied the principle of mechanization to human labor. All these trends were intensified by the World War. In the post-war period the doctrine of scientific management made the waste of raw materials or by-products a moral crime; labor management came to be considered profitable and high wages to be regarded not as undesirable cost items, but as stimulants to maximum output, while fatigue studies determined the physiological optimum of such effort. At the same time the increasing spending power of the laboring classes made for market expansion and large scale production. Successful rationalization presupposes, however, the adjustment of production to demand. When neither scientific salesmanship nor new forms of consumers' credit succeeded in adjusting effectual demand to the capacities of rationalized production, resort was had to the regulation of supply by voluntary agreements between producers or in some cases by compulsory coordination through government agencies. With individual rationalization thus leading to such irrational results as capital losses and unemployment on the one hand and production restrictions on the other, there developed in many quarters a conviction of the necessity for centralized rationalization by government control.

It was to the United States that German industry turned for inspiration when the post-war depression was most acute. Isolation due to war and inflation had greatly reduced Germany's industrial efficiency, just at the time when it needed an export surplus for reparations payments. To secure this surplus the government turned to protection and intensification of agriculture to diminish imports and to ration-

alization of industry to increase exports. The American miracle, as manifested in the second industrial revolution, was to be reproduced; high wages were to increase purchasing power and thus expand the home market, the substitution of machines for men was to lower costs per unit of the increased output. It soon became evident, however, that Germany's main advantage had been adaptability to individual demands, not rigid standardization for serial production, and that the replacement of efficient cheap labor by costly machinery was but pseudo-rationalization. The benefits derived from better machines or organization (serial production) were turned into positive loss through the costliness of borrowed money. Moreover technical rationalization was nowhere accompanied by economic rationalization. After their attempt to stop overproduction by fixed quotas the cartels indulged in nation wide propaganda for the increase of capacity; while complaints about the high rate of interest were universal, agriculture and industry were encouraged to borrow blindly. Attempts were then made to raise prices by various protectionist measures. Rationalization as practised in Germany during the post-war years has been called the art of cutting costs while raising prices. Although it was technically efficient, it expanded the country's productive capacity beyond all possibilities of sales, saddling it with a huge debt, partly foreign.

These efforts of German industry attracted considerable attention both in England and in France. In the latter country interest centered chiefly in the scientific management aspects of rationalization. Considerable discussion of the technical backwardness of English industry led to the organization in that country of various groups interested in the problem, but the crisis of 1929 put an end to experimentation on a large scale.

Soviet Russia took over the idea of rationalization along with that of industrialization, finding it all the more necessary to raise the efficiency of both rural and urban labor as a means of protection against famine and foreign attacks. An absolute government enforcing nation wide standardization can establish uniform markets and spread overhead expense over a huge output so that costs are reduced to an almost unimaginable extent, especially when capital costs need not be taken into account and wages can be kept low. The Soviet program called also for mechanized scientific farming by cooperatives or on big government estates to provide the country

with cheap food and a considerable export surplus and to reduce the number of farm hands, releasing labor for industrial development. This giant rationalization program, enforced with boundless energy, can claim success on the technical, or construction, side. With the help of foreign engineers huge up to date plants have been erected, and large estates for mechanized agriculture have been formed by the expulsion of individual holders or by their combination into cooperatives. Economic success, however, is still not assured: the agricultural output remains insufficient for both home consumption and export, while the ultramodern works do not run evenly, and the employment of foreign experts is still necessary.

Technical rationalization indeed is different from successful economic and financial rationalization. Properly constructed and efficiently organized plants may be financial failures when forced to run below capacity, either because interest charges on borrowed money can be met only by high prices or for other reasons. Technically out of date plants may work more cheaply and more profitably than their modernized but debt charged rivals. Rationalization moreover may be successful for the individual concern and at the same time saddle the nation with unemployment.

Rationalization, if it is to be socially sound, must first prove profitable to the entrepreneur and enable him rapidly to liquidate the debts incurred. It must benefit the public through an adequate fall in price because of lowered costs of production. In the third place, labor retained in the rationalized concerns must earn high wages; the replacement of expensive labor by costly machinery run by low paid workers is scarcely desirable. Moreover labor displaced by new processes must be absorbed by new demands for additional raw material or machine construction; and the laboring class as such must benefit by a reduction in the cost of living. The profits of the rationalized industry and the income of the country at large must be increased sufficiently to provide employers, or taxpayers or both, with funds for the care of displaced workers. The temporary displacement of workers by the rationalization process may not be a serious social problem, but their being kept in permanent idleness, unfit for work as well as for citizenship, constitutes a social waste which more than outweighs the economic savings of rationalization.

Rationalization is too serious a business to be

entrusted to individual business men. Cooperation as such does not guarantee sane judgment; some of the gravest mistakes have been made by cartelized industries. And it cannot be assumed that governments, subject to the pressure of various interests, necessarily rationalize more wisely. Governments might, however, successfully supervise rationalization, thus steadying rather than directing the process, particularly through control over the flow of capital. Rationalization must go on if a stationary society is to be avoided, but at a more equable rate if a stable society is to be achieved.

Rationalization, however, cannot succeed when confronted by an irrational or antirational political set up. The spread of nationalism in spite of some counter efforts, such as those of the League of Nations, is negating the natural geographical basis of the existing economic system. In many countries tariff protected industries are enabled to produce goods which are superfluous in view of the available supply. Technical rationalization, by enormous outlays of capital, has made it possible for agriculture and industry to produce even under most unfavorable conditions. Such rationalization cannot lead to increased satisfaction of human wants. It may be purposeful when national self-sufficiency is the political ideal, but economically and socially it remains essentially irrational or antirational.

RATIONING. See WAR ECONOMICS.

RATKE, WOLFGANG (Ratichius) (1571-1635), German educator. Ratke, often called Ratichius, was born in Holstein and received his education in Hamburg and at the University of Rostock. From 1603 to 1611 he lived in Holland, where he attempted to interest Prince Maurice of Orange in his educational ideas. Meeting with no success he returned to Germany, and in 1612 in a "Memorial" to the Imperial Diet at Frankfurt he set forth his plan for reforming the German schools, which had become rigidly scholastic. He urged that instruction in all common branches be given in the vernacular, that the Latin Bible be replaced by the German and that the teaching of foreign languages be simplified. He advocated state schools, state school supervision by professional experts and compulsory education with a three-year preparatory German course for girls as well as for boys. Like Leibniz after him, Ratke hoped to achieve national and political unity through uniform speech and government and a common religion. He won the support of several princes and scholars and in 1614 he was given an opportunity to demonstrate his methods in Augsburg. The experiment failed, as did subsequent attempts at Cöthen (1618-20) and at Magdeburg (1620-22), partly because of Ratke's lack of executive and organizing ability and partly because of unsettled religious conditions in Germany at the time.

Ratke's pedagogical principles included repetition and continuous practise "without compulsion," the elimination of rote memory work, and uniformity of method in all instruction, with emphasis upon the "natural" ("everything ac-

cording to nature's order and course"); new subject matter should be mastered by procedure from the particular to the general. His progressive contributions were emphasis on the vernacular and the study of languages based on literature and drill. The weaknesses of his system were disproportionate memory training, absence of individual activity and a cramping of the teacher's personality. Although the practical results of Ratke's life work were small, his educational ideas survived, especially in the *Didactica magna* of his successor, Comenius.

RATZEL, FRIEDRICH (1844-1904), German geographer. Ratzel came into the field of geography from zoology by way of journalism. His first publication (1869) dealt with organic evolution; all his subsequent geographic work was based on biologic views, which re-expressed the tradition of Ritter in harmony with later nineteenth century science. In order to finance his zoological studies, Ratzel wrote travel sketches, which met with immediate success. As the result he was engaged by the *Kölnische Zeitung* to visit and report on various parts of the world, including the United States and Mexico. From feuilleton writing Ratzel passed directly to university lectures in geography at Munich and then at Leipzig, where he attracted a steadily growing audience until his death.

Ratzel is remembered most widely for his formulation of anthropogeography as the conditioning of culture by environment, which he called the dynamics of human geography and for which he supplied most of such generalizations as are still current. In the second volume of his *Anthropogeographie* (2 vols., Stuttgart 1882-91; 4th ed. 1921-22) he considered the geographical distribution of man and his culture. From Moritz Wagner, the zoologist, Ratzel adapted the theory of development of new or-

ganic forms by migration and isolation as the fundamental thesis of human history. By pioneering studies of the geographical distribution of individual culture elements, by first stating the case for diffusion of culture and by anticipating the culture area concept Ratzel became parent to the modern cultural history school in anthropology.

Out of the biologic viewpoint proceeded also his *Politische Geographie* (Munich 1897, rev. ed. 1903; new ed. by E. Oberhammer, 1925). The state was considered a quasi-organism, bound to a particular *Lebensraum*, in contest for space with other states and exhibiting distinguishing characteristics of vitality or decadence.

Ratzel directly stimulated, and wrote the philosophy of, the first actual *Weltgeschichte*, carried out by his pupil Hans Helmolt (9 vols., Leipzig 1899-1907).

With the exception of the culture area concept, Ratzel made relatively slight contribution to present scholarship. The reason perhaps is to be found in his general philosophic view that there are sciences of actuality and sciences of abstraction and that geography belonged among the latter. It has been excessively difficult to establish satisfactory inquiries directly into these relationships. On the other hand, Ratzel's fruitful thesis, that of the diffusion of culture, is applicable inductively in the examination of the arrangement of phenomena and has contributed therefore to a "science of actuality," with which he was not concerned.

CARL SAUER

Consult: Hassert, Kurt, in *Geographische Zeitschrift*, vol. xi (1905) 305-25, 361-80.

RATZENHOFER, GUSTAV (1842-1904), Austrian sociologist. Ratzenhofer, the son of a clock maker, entered the army in 1859; he rose to the position of lieutenant field marshal. He served as president of the high military court of Vienna, from which position he retired in 1901. He wrote several works on military science but is best known for his contributions to political and sociological theory.

Ratzenhofer developed a monistic system whose core was his theory of interests, which he conceived as the unconscious motives and the conscious ends of behavior and the basis of all action and achievement. He contended that every individual seeks to express without hindrance his primal impulses for self-preservation and propagation; that with progressive increase in numbers and intensified struggle for existence

individual interest develops into absolute hostility of each person toward his fellow men. The hostility is submerged in the recognition of the blood bond and through cooperation in labor and war, only to break out whenever these common interests are disregarded.

Ratzenhofer regarded conflict as the fundamental social process and in common with Gumpłowicz saw the genesis of the state in the struggle of races. According to his evolutionary scheme all primitive social organizations were based on kinship; as population expanded territorially, racial differentiation occurred. In the resultant conflict between various races over the food supply, subjugation of one group by another led to a higher step in the social process in which the social structure no longer rested principally on blood relationship but upon the state as a system of control. There followed a differentiation of social structures based on commerce, alternating with socialization which arose from social necessity and expressed itself in voluntary submission for the sake of social interest or in forcible subjugation under an alien interest. In the course of the evolutionary development of the social structure from simple to complex the state, based on conquest, gave way to the culture state, which attempts to control conquered peoples in harmony with creative freedom by maintaining order in social affairs through compromise of opposing interests. Ratzenhofer held that struggle and war continue to consolidate the social structure and are thus sources of political power, while culture and commerce weaken the social bond; the universal extension of the socialization process tends to produce concord of interests through the increasing perfection of the social organization, but the basis of social conflict remains.

Ratzenhofer's views had wide influence, especially in the United States, where Ward and Small elaborated his theory of interests and the former also his theory of the conflict of races.

GOTTFRIED SALOMON

Important works: *Wesen und Zweck der Politik, als Theil der Sociologie und Grundlage der Staatswissenschaften*, 3 vols. (Leipzig 1893); *Die sociologische Erkenntnis* (Leipzig 1898); *Der positive Monismus und das einheitliche Princip aller Erscheinungen* (Leipzig 1899).

W., *General Sociology* (Chicago 1905) pts. iv-v; Stein, Ludwig, *Der soziale Optimismus* (Jena 1905) ch. ix; Gramzow, Otto, *Gustav Ratzenhofer und seine Philosophie* (Berlin 1904); Gumpłowicz, L., "La sociologia e Gustavo Ratzenhofer" in *Rivista italiana di sociologia*, vol. ix (1905) 269-97.

RATZINGER, GEORG (1844-99), German Catholic economist. Ratzinger, a theologian, took a keen interest and participated actively in political life, serving for several years in the Bavarian state assembly and the German Reichstag. His prize winning work, *Geschichte der kirchlichen Armenpflege*, won him his doctorate at Freiburg in 1868 (2nd ed. 1884). In 1881 he published *Die Volkswirtschaft in ihren sittlichen Grundlagen* (Freiburg i. Br.), the second edition (1895) of which contained a survey of Catholic social reform literature in Germany, Austria and Switzerland from 1862 to 1894. He was the author of a number of books and of a series of essays, dealing chiefly with social reform, which appeared in the *Historisch-politische Blätter* and in other periodicals.

Ratzinger held that the capitalist system was morally and economically deficient and that the method of production and the system of consumption which it conditioned were not rational, and he believed that the technical means of production could be made to yield a much higher social product. He was not, however, a socialist: he defended private property, insisting at the same time that it should be subordinated to social and moral principles. He considered the proletariat not so much an economic as a spiritual and moral problem which could be solved by means of education and economic reform. He advocated self-help through cooperation, which would enable the poor and economically weaker groups to resist successfully the superior power of capital and which would serve to bring capital and labor together without abolishing private property or endangering the natural order. The cooperatives, to be composed of employers and workers of the respective trades acting under state supervision, would standardize products and safeguard the quality of goods. For agriculture Ratzinger demanded credit regulation, vocational training, the standardization of grain and of other farm products and the general adoption of trademarks.

G. BRIEFS

RAU, KARL HEINRICH (1792-1870), German economist. Rau studied at the University of Erlangen, where he became professor in 1815; in 1822 he was called to the chair of economics in Heidelberg. He was a member of the first Baden chamber and was elected to the Frankfurt Assembly in 1848.

Rau was not an original thinker. He owed his fame mainly to his *Lehrbuch der politischen*

Ökonomie (3 vols., Heidelberg 1826-37; vol. i, 8th ed., vols. ii-iii, 5th ed., Leipsic 1862-69), which dominated the teaching of economics at German universities for almost fifty years and thus shaped the economic views of several generations of German administrators. The book combines abstract exposition of the classical principles with a fulness of illustrative factual material, thus giving a rounded account of the economic world. The exposition of "economic laws" in the first volume is followed by a second volume devoted to *Polizeiwissenschaft*, a term equivalent to the modern concept of economic policy, and by a third volume dealing with problems of public finance. This tripartite division of economics has to the present day remained the established tradition in the teaching of economics in German universities. Rau's influence was considerably weakened with the advent of the German historical school and its emphasis on the relative character of economic principles and on the ethical evaluation of economic phenomena particularly in the field of distribution of wealth. He had a more profound effect in the field of public finance; with great consistency he elaborated the principle that in determining public expenditures and sources of revenue prime consideration should be given to the effect of such fiscal measures upon the broader aspects of production and economic well being. It was Rau's work on public finance which led to Adolf Wagner's systematic treatise in 1876.

KARL PRIBRAM

Other important works: *Ansichten der Volkswirtschaft* (Leipsic 1821); *Über die Kameralwissenschaft* (Heidelberg 1825); *Über Beschränkungen der Freiheit in der Volkswirtschaftspflege* (Heidelberg 1847). For a full list, see Meitzel, C., in *Handwörterbuch der Staatswissenschaften*, vol. vi (4th ed. Jena 1925) p. 1171-72.

Consult: Roscher, Wilhelm, *Geschichte der Nationalökonomik* (Munich 1874) p. 847-60; Gerlach, Otto, "Geschichte der Finanzwissenschaft" in *Die Entwicklung der deutschen Volkswirtschaftslehre im neunzehnten Jahrhundert*, 2 vols. (Leipsic 1908) vol. ii, ch. xxxviii, p. 25-30; Meyer, Robert, *Principien der gerechten Besteuerung in der neueren Finanzwissenschaft* (Berlin 1884) p. 43-46.

RAVENSTONE, PIERCY (died c. 1830), English writer on economics and social reform. All that is known of Ravenstone is found in his two books, *A Few Doubts as to the Correctness of Some Opinions Generally Entertained on the Subject of Political Economy* (London 1821) and *Thoughts on the Funding System and Its Effects* (London 1824). In the latter he attacked the

"funding system" on the ground that it is impossible by borrowing to throw a real burden on to posterity, although he admitted that the taxation accompanying it consisted in breaking up large landed estates, but in sinking funds he saw only a device which enlarged the wealth and power of the financiers at the expense of the productive workers.

More widely read than most of his contemporaries, either orthodox or critical, Ravenstone's chief contribution arose from a more realistic grasp of history. He viewed social development as a dynamic process and expected political economy, by interpreting social change in the past, to offer guidance for the future. The two chief motivating forces underlying economic and social development are the growth of populations and inventions. A shrewd examination of the conditions of human fertility led Ravenstone to regard Malthus' fears as groundless, although his further contention that population progressed everywhere at the same rate went beyond the evidence he presented. An increase of population, he held, increases productivity more than proportionately in that it makes possible further division of labor, with its attendant economies, and stimulates discovery. He denied the heroic theory of inventions, regarding them as arising cumulatively out of society's practical needs and as more probable in dense than in sparse populations.

Ravenstone rejected emphatically the conception of capital as an independent creative element in economic life and regarded it merely as a form of accumulated labor unjustly appropriated by the ruling classes by virtue of their superior legal and political power, to this extent anticipating the Marxian concept of surplus value. He referred to capitalistic property as "artificial" in distinction from property acquired through the expenditure of labor, which he deemed "natural." Condemning the former as parasitic, he upheld staunchly the right to the latter as providing the basis of what appears to have been his ideal society, a community of small peasant proprietors and handicraftsmen.

PERCY FORD

Consult: Beer, M., *History of British Socialism*, 2 vols. (London 1919-21) vol. 1, p. 251-58; Seligman, E. R. A., *Essays in Economics* (New York 1925) p. 98-100.

RAW MATERIALS. This term is restricted commonly to materials in a natural crude, or unwrought, state: the immediate products of agriculture, mining and forestry. In a broader

sense the term is applied also to commodities which have undergone one or more manufacturing processes but are still in a relatively crude form, being the raw materials for a more advanced process. Many foodstuffs are not typically raw materials, as the characteristic of a raw material is that it must undergo a manufacturing process before being used. Coal, however, is definitely a raw material.

Raw materials may be divided into organic (vegetable products, animal and some other foods, beverages, spices, drugs, plant juices, oils, fats, leather, tanning materials, lumber, woods, fibers, dyes) and inorganic (minerals, metals). Or they may be classified as reproducible, replaceable, genetic materials which can be produced over a comparatively brief period by cultivation or breeding or through technical processes (most vegetable products); non-reproducible but in part recoverable (certain minerals and metals, most products of extractive industries); and non-reproducible and non-recoverable (abrasives, magnesite, graphite). Some materials, such as manganese and tungsten, are recoverable under certain conditions; under others, as in the manufacture of steel, they are not recoverable. Still another classification differentiates between materials of which stocks tend to accumulate (iron, copper) and those used but once (coal, oil, potash, coffee).

Some raw materials are considered "strategic," "basic" or "key" resources because they are of vital importance in the economic and political life of nations and play an important role in shaping commercial policies. For the United States raw materials may be divided into three categories. First, there are those of which there is an adequate domestic supply and in some cases an exportable surplus—reproducible raw materials (cotton, cottonseed oil) and non-reproducible materials (forest products, earths, bismuth, lead, cadmium, phosphates, metallic magnesium, molybdenum, alumina, zinc, silver, sulphur, salt, copper, petroleum, coal and iron ore). The second group consists of raw materials for which there is virtually total dependence on outside supply—reproducible raw materials (shellac, quinine, natural camphor, copra, jute, sisal, manila, silk, flax and rubber) and non-reproducible raw materials (quebracho, potash, sodium nitrate, tin ore, platinum and allied metals, nickel ore, antimony ore, cryolite, asbestos and monazite). The third comprises those not produced in sufficient quantities to satisfy domestic demand: reproducible raw materials

(citrate of lime, hides and skins, certain vegetable oils, e.g. coconut, olive, linseed and peanut oil, tobacco, hemp and wool) and non-reproducible raw materials (arsenic, manganese, chromite, tungsten, magnesite, abrasives, barites, vanadium, fluor spar, mica, quicksilver and natural graphite).

Changes take place in the character of some raw materials, largely as a result of technical and scientific progress, so that a commodity classed as a raw material at one time may be considered as a finished product at some other time and vice versa. Natural camphor and indigo were formerly classed with raw materials. Their synthetic substitutes are now considered as finished products. Coal tar, formerly a finished product, is now a raw material for numerous chemical manufactures.

The total net value of the annual material production of the world in recent years has been roughly estimated to approximate \$140,000,000,000, of which foodstuffs (not all necessarily raw materials) constitute about \$59,000,000,000; primary products more than \$83,000,000,000; non-metallic raw materials \$10,500,000,000; fuels and other sources of power \$10,000,000,000; metals \$3,500,000,000. The United States' share of the world total of all material production amounts to 26 percent; of its own total, foodstuffs account for 19 percent, non-metallic raw materials 26 percent, fuel and other power resources 40 percent, metals 42 percent, primary products 23 percent to 24 percent. Value added by manufacturing in American industries has averaged 28 percent in recent years.

The raw materials industries represent a large capital investment, which tends to grow with increasing demand for materials. According to an analysis by the Federal Trade Commission in 1922, American corporations represented a wealth of \$102,000,000,000 (nearly one third the estimated total wealth of the United States), of which \$10,100,000,000, or 9.8 percent, was owned by corporations in raw materials industries; \$33,600,000,000, or 32.9 percent, by manufacturing corporations; and \$27,300,000,000, or 26.7 percent, by transportation and other public utilities. To this must be added \$61,454,000,000 for agriculture, nearly one half of its products being used for industrial raw materials. Fixed assets (land, buildings and equipment) ranged from 54.5 percent in manufacturing, 68.2 percent in agriculture, 84.2 percent in mining and quarrying, to 86.4 percent in transportation and other public utilities.

Prior to the industrial revolution the self-sufficient, isolated economy produced and consumed the limited number of raw materials required for food, raiment and shelter, mostly at home. An extensive raw materials market, with special trade organization, interrelated price levels and mutual non-acquaintance of producers and consumers did not exist. The handicraft artisan, limited capital and absence of division of labor characterized the economic life of the time.

In the eighteenth century a fundamental change in the economic importance of raw materials came about as a result of the industrial revolution and the spread of capitalism. Mechanical energy applied to large scale production gave rise to an enormous demand for the ever increasing number of raw materials required by the machine age. Improved methods of mining, agriculture, transportation, financing and scientific management and research made available and facilitated the acquisition and more efficient exploitation of new and continuous domestic and overseas sources of supply of saltpeter, copper, petroleum, iron, cotton and other leading raw materials. Capitalist methods of production and distribution, including the growth of modern speculation, tended to produce a world market for raw materials and problems of international scope. The significance of raw materials was reflected in such phrases as "coal and iron rule the world" and "king cotton."

The huge increase in the world demand for industrial raw materials in modern times may be illustrated by the following production data: the total world production of coal and lignite rose from approximately 207,000,000 metric tons in 1868 to 1,258,000,000 in 1932; pig iron from 18,500,000 metric tons in 1880 to 39,800,000 long tons in 1932; petroleum from 5,799,214 barrels in 1870 to 1,311,377,000 in 1932; cotton from 12,200,000 bales in 1891 to 24,000,000 in 1932; sugar from 10,106,000 short tons in 1895 to 26,821,000 in 1932. In the United States alone the total value of mineral products increased from \$403,120,000 in 1881 to \$4,764,800,000 in 1930; the total production of lumber from 12,755,543,000 board feet in 1869 to 36,886,032,000 in 1929; pig iron from 54,773 long tons in 1810 to 28,686,846 in 1930; cotton from 2,097,000 bales in 1866 to 13,002,000 in 1932; crude petroleum from 2,113,609 barrels in 1861 to 785,159,000 in 1932. There has been a steady and phenomenal growth in the quantities of raw materials consumed by the manufacturing

industries (Table 1). Modern large scale industry, with its great masses of fixed capital and increasing productivity of labor, requires more and more raw materials.

TABLE I

RAW MATERIALS AND VALUE PRODUCT IN MANUFACTURES, UNITED STATES, 1899-1929*
(In \$1,000,000)

YEAR	RAW MATERIALS	VALUE PRODUCT
1899	2,800	7,600
1904	3,700	10,000
1909	5,200	13,700
1914	6,500	16,200
1919	14,500	39,250
1921	9,400	27,700
1923	13,200	39,650
1925	13,600	40,400
1927	13,450	41,000
1929	15,450	47,100

The growing demand for industrial raw materials is closely interrelated with technical progress and its economic utilization. The process of vulcanizing rubber and the subsequent application of the internal combustion engine to the automobile had a direct bearing on the world production of crude rubber, which increased from 67,000 long tons in 1907 to 820,000 in 1930. The introduction of intensive and scientific methods of agriculture resulted in a greatly increased demand for mineral raw materials for the fertilizer industry. In the United States the value of fertilizers produced rose from \$891,344 in 1860 to \$177,226,967 in 1923. Particularly since the beginning of the twentieth century woodpulp has been in ever greater demand for the manufacture of paper. In the United States the domestic consumption of mechanical and chemical woodpulp increased from 1,147,000 short tons in 1899 to 8,042,000 in 1926. The wide use of artificial silk has created a growing demand for such raw materials as cotton linters, lead and various forms of cellulose. The large current consumption of canned foods resulted in increased requirement of tin. The introduction of the telegraph, telephone and radio and the expanding use of electrical appliances contributed markedly to the demand for copper, of which approximately 25,000,000 pounds are required annually in the production of new radio sets in the United States. It is estimated that more than 100,000,000 miles of copper wire are in service for telephones and more than 30,000 miles for submarine cables. The annual con-

sumption of copper by the automobile industry averages 250,000,000 pounds.

Notable progress has been made moreover in the utilization of raw materials through technical improvements in both extraction and manufacturing. Among the outstanding earlier inventions of this type may be mentioned Eli Whitney's cotton gin in 1793 and the extraction of sugar from beets by Merggraf in 1747 and by Achard in 1809. Justus von Liebig's discovery of the importance of mineral substances as plant food led to a systematic commercial exploitation of mineral raw materials for the fertilizer industry. The Thomas and Bessemer processes revolutionized the iron and steel industry, the electrolytic refining process the copper industry and the Gill kiln and Frasch process the manufacture of commercial sulphur. The by-products coke oven and modern industrial chemistry made possible the production of important new natural and synthetic raw materials. More recently the Haber-Bosch process of extracting nitrate from the air and that invented by Bergius for extracting petroleum from coal have opened up practically unlimited new sources of essential industrial raw materials.

The growing importance of raw materials and the tendency to combination in general led to the concentration of control of raw material production in a few hands. This assumed two forms: control by corporations interested exclusively in a particular raw material and control by manufacturing corporations as a result of integration and the desire to assure a continuous supply of raw materials. Other forms (in the United States) were control of forests and mineral reserves by railroads, which secured grants of public lands from the government, and control of coal mines by railroads eager to monopolize shipments. Concentrated corporate control of available key reserves of raw materials has advanced greatly during the past fifty years in all major industrial countries. In the United States, according to the Federal Trade Commission, 8 companies in 1922 owned three quarters of the anthracite coal reserves; 6 companies controlled about one third of the total developed water power; 30 companies over a third of immediate reserves of bituminous coal; 2 companies (United States Steel Corporation and Bethlehem Steel Company) well over half of the iron ore reserves; 4 companies nearly half of the copper reserves; and 30 companies over 12 percent of the petroleum reserves. Concentration of control is increased and strengthened

through financial community of interest, through production and price agreements and through interlocking directorates.

Concentration is particularly intense in non-reproducible raw materials, like minerals and metals. The nitrate industry of Chile is controlled by a compulsory cartel in which the government participates, the Chilean Nitrate Producers' Association. Prior to the commercial manufacture of synthetic nitrate in 1913, the Chilean cartel had a world monopoly in this key raw material. Another basic raw material of the fertilizer industry, potash, the production of which prior to the World War was a natural monopoly of Germany, has been controlled by the Franco-German International Potash Cartel since 1924. The world supply of brimstone sulphur is dominated almost completely by the Sicilian sulphur syndicate and by two American concerns, the Texas Gulf Sulphur Company and the Freeport Sulphur Company, all three operating under a joint price and territorial agreement. The production of bauxite (aluminum) throughout the world is controlled by a combination of Swiss, German, French and American producers, dominated by the Aluminum Company of America. Coal and iron production in European countries is completely controlled by local cartels, some of which are united in international cartels. The Swedish Grängesberg-Träfik A.-B., in which the Swedish state participates, controls the extensive high grade iron ore deposits in Kirunavara. Of important raw materials for drugs, the Kina Bureau in Amsterdam has a monopoly of the cinchona (quinine) supply source in the Dutch East Indies.

The nickel resources of Canada are in the hands of a small number of concerns. Pulpwood supplies are dominated by great corporations in most countries. A score of large corporations in the United States, England and Belgium control the world's supply of copper, and the industry has a world cartel. This is true of all metals. The available petroleum resources of the world are to a large extent controlled by the Royal Dutch Shell concern, the Anglo-Persian Oil Company and several American concerns, especially the Standard Oil interests.

There are, however, certain raw materials (wool, cotton, hides, sugar) which do not lend themselves to this type of control but are usually subject to cartel agreements, governing prices, standards, credit terms and marketing practises. Attempts to corner the supply of certain raw materials, such as the Secrétan copper corner of

1890 or the Leiter wheat corner of 1898, have been sporadic and short lived. The importance of control and monopoly in the raw materials industries as a whole is still largely relative. Competition, science, diminishing demand, substitutes, newly discovered resources and legal restraints have tended to check and destroy monopolistic efforts, particularly where world cartels are concerned. Despite all controls there are periodical overproduction and disastrous declines in prices.

Geographic concentration, an outstanding feature of most raw materials industries, facilitates the acquisition and control of supply. Of the important fertilizer raw materials commercially workable deposits of potash are located principally in Germany and France, natural nitrate deposits in Chile and phosphate rock is to be found in Florida and northern Africa. Of important alloys used in the steel industry manganese is localized mainly in Russia, India and Brazil; chromium in New Caledonia and Rhodesia; vanadium in Peru and the United States; antimony in China; nickel in Canada. Tin is mined mainly in the Malay Peninsula, Bolivia and the Dutch East Indies; platinum in Russia and Colombia. The anthracite coal deposits of the United States are located in a section of Pennsylvania and coking coal is localized in the Connellsville and the Birmingham areas. The coal deposits of central Europe are confined primarily to the Saar, Ruhr and Upper Silesian districts; those of Russia to the Donetz basin. Of the textile raw materials cotton is produced mostly in the cotton belt of the United States, India and Egypt; natural silk in China and Japan; jute in India; and sisal in Mexico and the Philippines. The bulk of the world's rubber supply comes from British Malaya, the Dutch East Indies and Brazil. The production of coffee is concentrated in Central and South American countries, that of copra in the Philippines and the Far East.

Geographic concentration of raw materials has a vital bearing on the problem of supply, transportation and the location of industries. With the exception of the United States most industrialized nations must depend on outside sources of supply for most of their raw material requirements. In the case of such important industrial raw materials as cotton, wool, petroleum, hides and fertilizers this necessitates long distance oversea and transcontinental shipments, so that transportation charges become a decisive factor in the cost of production of manufactured

goods as well as in the location of manufacturing industries. Some raw materials, like iron and steel, whose transportation costs are important primarily because of the relative disproportion of bulk, weight and value, tend toward concentration of manufacturing. This accounts in large measure for the localization of the iron and steel industry of the world in the United States, England and central Europe. Other raw materials, like cotton, silk, tobacco and cellulose, with relatively low transportation costs, generally favor manufacturing dispersion.

The marketing of raw materials presents certain peculiar characteristics. The great bulk of raw material arrives at its market without much of an intervening manufacturing process. It is relatively difficult to apply standards of grading to some raw materials, such as wool, but grades have been established for the principal commodities. In general the market demand for the essential raw materials is established, so that advertising is of relatively minor importance; indeed advertising is clearly wasteful in the case of products difficult to identify. Control and risk are important factors in marketing raw materials. Wide fluctuations in output and prices, due to labor, crop and climatic conditions, form a frequent disturbing factor in the coal, oil, wheat, cotton, sugar and tobacco industries. Overproduction and disastrous price declines are frequent. Efforts at stabilization have been made at different times, chiefly through joint producers' agreements to curtail production. On the largest scale this has been attempted by the copper and sugar producers of the world since 1931 (Chadbourne plan) and by the wheat producing countries under a joint agreement to restrict acreage, signed at London in August, 1933.

The financing and speculation involved in the carrying over of accumulated stocks of raw materials have given rise to difficult economic problems in connection with a number of national industries, such as coffee in Brazil, sisal in Mexico, sugar in Cuba, wheat in the United States and rubber in Malaysia and the East Indies. In recent years competitive conditions obtaining in the United States in the marketing of such raw materials as lumber, coal and petroleum, where numerous producers compete in a glutted market, have resulted in ruinous prices, dumping and various unfair trade practices. Under the Sherman Anti-Trust Act and similar laws various stabilization plans were held illegal. A new policy inaugurated under the National

Industrial Recovery Act, 1933, is designed to regulate production and distribution, including raw materials, through trade associations and groups functioning in accordance with codes of fair competition.

The principal spot markets for raw materials are situated at the financial centers which were originally most closely related to the points of assembling and primary distribution. London was long the predominant market for most of the raw materials of international trade. It still is an important market for wool, cotton, metals, rubber and rice. New York has become a leading market for cotton, sugar, coffee and metals; Santos, Hamburg, New Orleans and Le Havre for coffee; Liverpool for grain and cotton; Chicago for grain. Organized exchanges for hedging and trading in futures have been established for such raw materials as grain, cotton, sugar, coffee, cacao, rubber, copper, lead and other metals.

In the course of modern industrial development increasing pressure has been exercised on the available sources of raw materials and on the search for new sources of supplies. This tendency may be ascribed in part to the fact that large scale industry, in the face of depletion of available stocks, needed an assured, unified and increasing supply of raw materials. Other factors include military, naval and merchant marine requirements of oil, coal and steel; the search for foreign investments; the pressure of population on food supply; and the endeavor of states to become economically self-sufficient. British efforts to secure oil concessions in Mesopotamia and to pipe the oil to the Palestinian coast and Japan's acquisition of raw materials in Manchuria are recent examples. The general result has been that the major industrial countries have become largely importers of raw materials and exporters of manufactured goods. Before the World War this was true of the United States, England, Germany and France. More recently a similar trend has been apparent in the foreign trade of Czechoslovakia and Japan. Other countries, principally Russia, the Balkan and the Latin American states, have been primarily exporters of raw materials and importers of manufactured goods.

The tendency to import raw materials and to export manufactured or partly manufactured goods developed in the United Kingdom long before it appeared elsewhere. It became most pronounced during the second half of the nineteenth century, when England was the workshop

of the world. In 1913 the value of raw materials imported (chiefly cotton, wool, wood, oilseeds, oil and rubber) amounted to £260,940,000, or 35.1 percent of the value of total British imports; by 1932 it had fallen to £164,162,000. The value of raw materials exported from England (approximately half of which consisted of coal) for the same years amounted to £66,173,000 and to £43,626,000 respectively. In England's export trade manufactured goods dominated. In 1913 the value of exported manufactures was £413,820,000, or 78.8 percent of the value of its total exports; and in 1932 £275,602,000, or 75 percent. England's reexport trade in raw materials is an important factor in its overseas trade; it amounted in 1913 to £63,699,000, or 58.3 percent of the value of its total reexports; and in 1928 to £66,494,000, or 55.3 percent.

Germany since the founding of the empire has rapidly become an importer of raw materials and an exporter of manufactured goods. The value of raw materials imported rose from 1,675,600,000 marks in 1872 to 6,242,300,000 marks in 1913 and to 7,243,700,000 marks in 1928; in 1931 it dropped to 3,477,900,000 marks, or 51.7 percent of the total. In 1911 raw materials imported constituted 52.7 percent of total German imports. At that time the German textile industry procured nine tenths of its total supply of raw materials from abroad. While the value of manufactured goods exported from Germany in the period 1874-77 amounted to about 37 percent of the value of its total exports, in 1907-10 it had mounted to 65 percent.

In France the annual average value of raw materials imported from 1909 to 1913 was 4,548,000,000 francs. In 1923 it amounted to 20,959,000,000 francs; in 1926 to 40,435,000,000 francs, or 67.8 percent of the value of total imports; and in 1932 to 13,231,919,000 francs, or 44.36 percent of total imports. On account of the general shrinkage in value the following figures giving the imports of raw materials in volume furnish a better picture of the steady increase in French imports of raw materials: from 1909 to 1913 they averaged 32,845,000 metric tons; and in 1931 they had risen to 46,930,000 metric tons.

In the case of England and Germany the economic crisis which set in after the World War has been aggravated by dependence upon imports of raw materials and exports of manufactured goods, partly because of increasing world industrialization and the trend toward economic national self-sufficiency. This has not been the

case in France, where industrialization is less advanced and agriculture is more active.

In the United States the progress of industrialization has been accompanied by a steady increase in the imports of raw materials and a steady relative decrease in exports. In 1866-70 the average yearly value of raw material imports (excluding foodstuffs) was \$48,000,000, or 11.7 percent of all imports; the value in 1929 was \$1,559,000,000, or 35.4 percent of all imports. In 1866-70 the average annual value of raw material exports was \$178,000,000, or 57.6 percent of all exports; the value in 1929 was \$1,142,000,000, or only 22.2 percent of all exports (Table II). At the same time the value of exports of finished manufactures rose from 14.9 percent of all exports to 49.1 percent, while imports declined from 41.3 percent to 22.6 percent. Exports began to outstrip imports of raw materials in 1915, and exported manufactured goods rose above imports of this type from 1898.

TABLE II
YEARLY IMPORTS AND EXPORTS OF RAW MATERIALS,
UNITED STATES, 1866-1929*

PERIOD	IMPORTS		EXPORTS	
	VALUE (In \$1,- 000,000)	PERCENT AGE OF TOTAL IMPORTS	VALUE (In \$1,- 000,000)	PERCENT- AGE OF TOTAL EXPORTS
1866-70	48	11.7	178	57.6
1886-90	162	21.7	277	38.1
1891-95	185	23.6	295	33.7
1901-05	325	33.1	432	30.3
1911-15	598	31.9	717	30.7
1915-20	1,348	49.1	1,160	18.2
1921-25	1,290	37.4	1,187	27.5
1926	1,792	49.5	1,261	26.8
1927	1,601	38.3	1,193	25.1
1928	1,467	35.9	1,293	25.7
1929	1,559	35.4	1,142	22.2

A continuous flow of raw material supplies is a necessary prerequisite to large scale industry, mass production, rationalized plant equipment and efficient marketing methods. Irregular supplies of raw materials are likely to render unproductive capital investments in industries manufacturing or consuming semimanufactured and finished goods. The superior financial and organizational advantages of large capitalist producing and manufacturing concerns and of organized groups like cartels, in the acquisition of their own raw material supplies, have tended to decrease the importance of independent and

small unit entrepreneurs in raw materials industries.

This need of industrial nations for raw materials and their increasing dependence upon foreign sources of supply have made complete national self-sufficiency in this respect impossible. The distribution of many essential industrial raw materials is so uneven the world over and their occurrence is so highly localized or unevenly distributed with respect to national industrial requirements that reliance upon imports of raw materials is universal. Even those countries with the richest and most varied natural resources are dependent for certain essential raw materials upon outside supplies. The United States, for example, is obliged to import large quantities of rubber, nickel, tin, platinum, antimony, chromite, cobalt, tungsten, quicksilver, manganese, vanadium, magnesite, asbestos, potash, nitrate, iodine, quinine, jute, hemp, sisal, rattan, silk, wool, hides, coffee, tea, cacao, spices, chicle, bristles and woodpulp. The United Kingdom is wholly dependent upon oversea supplies of cotton, petroleum, aluminum, lead, arsenic, copper, zinc, fertilizers, rubber, woodpulp, tobacco, tea, spices, drugs and copra. Germany relies largely upon foreign sources for its supplies of cotton, copper, nickel, petroleum, manganese, rubber, coffee and cacao. Japan imports iron ore, wood, petroleum, copper and cotton. Italy, Denmark, Sweden and Switzerland likewise lean heavily upon outside sources for various essential raw materials. Economic dependency of this type is especially burdensome in the case of countries without colonial possessions, like Germany, Czechoslovakia and Switzerland. International interdependence may be illustrated also by the fact that Germany and France control most of the world supply of potash, while Canada has a virtual monopoly of nickel and asbestos, Mexico of chicle. Brazil and the Latin American countries of coffee, Argentina of quebracho.

National insufficiency of raw materials may seriously handicap domestic industrial development and is apt to lead to loss of trade, unemployment and a lower standard of living. In Great Britain efforts to overcome some of its economic consequences have resulted in the establishment of a preferential policy within the empire since the Ottawa Conference of 1932. Elsewhere there has been a tendency to intensified rationalization of industry: avoidance of industrial waste, recovery of scrap iron, utilization of lumber, greater technological efficiency,

establishment of foreign branch plants, international cartel agreements covering raw material supplies, scientific research to provide substitutes, development of new sources of domestic supply and economic penetration of foreign countries.

The total value of the raw materials imports and exports of the world in 1930 amounted to approximately \$19,500,000,000 (Table III), which was 34.1 percent of the total world trade. Europe is mainly an importer of raw materials.

WORLD IMPORTS AND EXPORTS OF RAW MATERIALS, 1930

	IMPORTS (In \$1,- 000,000)	PERCENT- AGE OF TOTAL IMPORTS	EXPORTS (In \$1,- 000,000)	PERCENT- AGE OF TOTAL EXPORTS
Europe	6650	39.2	3140	22.6
Africa	190	14.2	480	55.7
Asia	1150	20.8	1830	46.7

Australia	120	10.5	260	43.3

Source: Adapted from Germany, Statistisches Reichsamt, *Statistisches Jahrbuch für das Deutsche Reich*, vol. 2 (Berlin 1932) p. 1014.

Since about the turn of the present century, but especially following the World War, interferences with the free movement of exports and imports of raw materials have played an important role in international trade. Export duties which more generally than import taxes are associated with raw materials, and constitutionally prohibited in the United States, are used today mainly by countries which are not highly developed industrially. They are applied for purposes of revenue, in order to conserve domestic resources and to protect domestic industry. Among the more important are Chile's export tax on nitrate (1879), the Brazilian export tax on coffee (1905), an export tax on tin ore by the Federated Malay States (1903) and the British tax on rubber exports (rubber restriction act of 1922).

In the tariff laws of modern industrialized countries import duties on raw materials required by domestic industry are generally of minor importance. On competitive raw materials they may be restrictive. The policy of industrialized countries on the whole is to levy tariffs on manufactured goods but not on raw materials. Embargoes and licensing systems were applied freely during the World War for the purpose of preventing raw materials from reaching enemy countries. In the United States they were administered by the War Trade

Board, Canada since 1900 restricts the exports of pulpwood from crownlands by means of an embargo and license system. Japan prohibits exports of crude camphor for refining purposes. Discriminatory export duties in favor of the mother country have long been in common use in colonial countries. Portugal makes wide use of this policy. Other instances are the export duties on tin ore in the Federated Malay States and Nigeria and on untanned hides and skins in India in favor of British industry. More recently export and import quotas and restrictions through foreign exchange control have interfered seriously with the movement of raw materials in international trade.

These restrictive measures on the free movement of raw materials assume a more menacing aspect as an expression of commercial rivalry in the direct intervention of governments. Control of exports of raw materials by government monopolies or agencies under government control or regulation has increasingly been established in various countries. Their object has been to obtain public revenue through export taxes, to maintain or augment the profits of the producers of the raw materials and to foster and extend the domestic manufacturing industry. The outstanding examples of such monopoly are the Chilean control of sodium nitrate, the Japanese camphor monopoly, the Franco-German potash combine, the Brazilian agency for valorization and control of coffee and the British export restrictions on rubber. Acting through the Association of Producers of Chilean Nitrate, a corporation approved and participated in by the Chilean government, a heavy export tax has been imposed since 1897 on nitrate shipments, ranging generally from a third to a half of the export value; the tax has supplied a large part of the state's revenue. The association, membership in which is compulsory, fixes prices and otherwise controls output. While the industry formerly was a monopoly of the nitrogen market, keen competition has developed in recent years with the European producers of synthetic nitrate. The association from 1920 to 1921 set prices much above the level which would probably have prevailed under competition and in some years made profits amounting to 50 percent of the capital. The Japanese camphor control is a state monopoly, which controls the collection and sale of raw camphor; sales prices are fixed by the government. The competition of synthetic camphor has limited the power of the monopoly, which pre-

viously could shape its price policy so as to obtain large profits. The Franco-German potash syndicate, composed of the German producers who are organized in a compulsory syndicate and the French producers dominated by the French government, controls about 95 percent of the world output of oxide of potash. The average rate of earning in 1928 amounted to from 12 to 22 percent of the total investment. The Brazilian coffee control grew out of an effort to stabilize that country's chief export industry. In 1905 a policy of restricting production was initiated and a valorization scheme established. For several years a fairly high level of prices was maintained, but in 1929 a serious crisis developed in the market, resulting in demoralization of prices.

The British restriction of colonial rubber exports (Stevenson plan), established November 1, 1922, contemplated the raising of prices through limitation of production. Technically only the exportation of rubber was restricted by means of a sliding export tax. The increase of the world output of rubber was temporarily checked and prices rose from an average of 27 cents per pound to as high as 95 cents, but the scheme had to be abandoned in 1928. It resulted in large profits for rubber producers mainly at the expense of American consumers. In the cases of Brazilian coffee and British rubber control speculators took advantage of market fluctuations. Both schemes aroused much opposition and ill feeling abroad and were discontinued largely as a result of failure to control and adjust market forces.

During the present century the struggle for raw materials has assumed international proportions, and the number of claims on the world's supply of raw materials has increased greatly. Competition has been intensified by the recent rapid industrialization of countries like Japan, Italy, France, the Soviet Union, Czechoslovakia and Canada. This post-war pace of industrialization, aiming at economic national self-sufficiency, has in some cases been systematically promoted by state subsidies and similar aids.

The growing world wide demand for raw materials is reflected also in the tendency of large manufacturing corporations and large producers of raw materials to acquire control of sources of supply in foreign countries through ownership or concessions, supplementing their control of domestic sources. For example, the Anaconda Copper Mining Company has ac-

quired valuable zinc and other ore deposits in Upper Silesia and Chile, the Guggenheim interests own extensive nitrate deposits in Chile, the Bethlehem Steel Corporation owns iron ore reserves in Chile, the Aluminum Company of America controls the world's major sources of bauxite, English textile manufacturers have acquired a large acreage of cotton in the United States, American manufacturers of chewing gum control chicle resources in Guatemala and British Honduras. The Bethlehem Steel Company has reserves of iron ore in Cuba and Chile; the United States Steel Corporation owns foreign sources of manganese. The International Harvester Company obtains its supplies of sisal directly from its own foreign sources of production. The Firestone Tire Company acquired and developed large rubber holdings in Liberia. Several large newspaper publishers in the United States own pulp and paper mills in Canada. This tendency is general among monopolistic combinations in all the highly industrialized countries.

The infiltration of foreign capital into raw material countries frequently results in political disturbances and government intervention. The Mexican constitution of 1917, amplified by subsequent government decrees, reserves subsoil rights to the state. In 1920 the United States government protested against certain petroleum provisions inserted into the San Remo agreement by Great Britain and France. Inability of imperialist nations to assure national self-sufficiency in raw materials through colonial imports has still further complicated the modern struggle for raw materials, as is illustrated by recent events in Japan and the Far East.

At the present time private corporate combinations, the international cartels, control the supply of some of the world's most essential raw materials. The copper export cartel, in which are affiliated all of the leading copper producing interests of the world, controls about 95 percent of the world's output of copper. An international cartel centering around the British firm of Lever Brothers, Ltd., manufacturers of soaps and margarine, controls about 80 percent of the production of copra and whale oil. The bismuth cartel, combining British, German, French, Italian and Dutch producers, in recent years controlled about 90 percent of world output and the international zinc cartel about 97 percent. Through agreements to curtail and regulate production a measurable degree of stabilization has been achieved, although internal dissension over allotment of output and disinclination

to cooperate on the part of low cost and high cost plants have resulted in making agreements of this type relatively short lived. In order to counteract such producers' combines cooperative buying organizations have been formed, especially by the cooperative wholesale societies of England, Germany and the Scandinavian countries; but they are not very successful because of the enormous economic and financial power of monopolist combinations.

The increasing aggravation of the problems involved in the international distribution and supply of raw materials became a matter of universal importance because of the effect of the overproduction of raw materials on the world depression. The enormous surplus stocks which accumulated in the post-war period and the failure to stabilize supply and demand are reflected in the chaotic conditions prevailing in the raw materials industries and markets. As a result the wartime controls and their abandonment have acquired especial significance, and renewed attention has been devoted to economic planning. The measures initiated under the United States National Industrial Recovery Act for the purpose of controlling and regulating production and distribution of basic industrial raw materials and agricultural staples are paralleled on an international scale by the recent agreement among the wheat producing countries of the world to reduce the world acreage of wheat, and by a growing number of international private agreements among producers of raw materials to control output. The probability of an increase in synthetic products and substitutes in the future gives added impetus to efforts at systematic control of the raw materials industries. Overtures with a view to international cooperative control have been made—in 1909 by President Theodore Roosevelt, more recently by the League of Nations—but they have been nullified by national self-interest and imperialist rivalry. But the problem must inevitably be met; it is intimately bound up with the future of the world.

RAWLINSON, SIR HENRY CRESWICKE (1810-95), English diplomat and archaeologist. Rawlinson was distinguished as an army officer and diplomat in the Middle East and as the principal decipherer of Persian and Babylonian

cuneiform. In 1827 he became connected with the East India service in a military capacity, for which he was fitted both by his social background and by his education. Possessed of an uncommonly active mind, he made the best possible use of his years in India, Persia, Afghanistan and Iraq, devoting himself equally to the geographical exploration of the country, to the study of its antiquities and to his military and political duties. During five years in Persia, occupied in training the native Persian army, he became interested in the cuneiform inscriptions found in that country. He deciphered Persian cuneiform independently of Grotefend, of whose work he had no previous knowledge, and copied the great trilingual inscription of Darius at Behistun. After deciphering the Persian part he used the latter as a key to the Babylonian script, which was far more difficult to decipher since the cuneiform characters represented ideograms and not alphabetic signs. His memoirs on the two versions (the third, in the Susan language, he left for others) appeared in 1847 and 1850 and established knowledge of these important but completely forgotten ancient tongues, the clue to the reconstruction of several thousand years of ancient history, on a solid basis ("The Persian Cuneiform Inscriptions at Behistun" and "On the Inscriptions of Assyria and Babylonia" in *Royal Asiatic Society, Journal*, vols. v-xi, 1847-49, and vol. xii, 1850, p. 401-83). As a result of his later work in these fields he published his great edition of the *Cuneiform Inscriptions of Western Asia* in five folio volumes (London 1861-84). Rawlinson's brilliant mind, at its best in decipherment, lacked the patience and the scholarly training to continue with the painstaking linguistic analysis required in order that the study of cuneiform might progress beyond his beginnings. His geographical work, scattered through many volumes of learned journals, was also of very great value. In political and diplomatic life, to which he devoted most of his later years, he won many laurels; he held a prominent place in the India council and in other administrative departments. His views on the struggle between England and Russia in the Near and Middle East are presented in *England and Russia in the East* (London 1875).

RAYMOND, DANIEL (1786–1849), American lawyer and writer on economics. Raymond, who was born and educated in Connecticut and practised law in Baltimore, was the author of *Thoughts on Political Economy* (Baltimore 1820; 2nd ed. as *The Elements of Political Economy*, 2 vols., 1823), the first formal treatise on political economy by an American. Offered as “an humble effort to break loose from the fetters of foreign authority,” the volume was a protest against the laissez faire policy and cosmopolitanism of the classical economists. Distinguishing between individual riches and social wealth, Raymond held that the latter could best be attained through a national economy nurtured by the government. Thus he favored a protective tariff in order to permit the fullest employment of the productive capacity of the nation and to maintain a stable domestic market. His discussion of credit is marked by provincialism; he viewed banks with suspicion and opposed the issue of banknotes, alleging that the banking system generally was an instrument for the enrichment of the few at the expense of the masses. On currency he took an extreme “hard money” position: all currency must be of government issue and all paper money must represent actual deposits of the precious metals. In common with the American thought of his day Raymond held that there was no essential distinction between rent and interest on capital; likewise, opposing Malthus, he claimed that the ills of British labor were due to faulty political organization rather than the pressure of population on subsistence. Despite Raymond’s long residence in Baltimore the New England influence finds expression in his chapter on slavery, which like his tract entitled *The Missouri Question* (Baltimore 1819) is a bitter denunciation of the practise on both moral and economic grounds. His economic thought is confined to the controversial questions of his time; it does not attempt to provide a general theory of value or of the distribution of income.

RAYMOND, HENRY JARVIS (1820–69), American editor and politician. Raymond exemplified a new theory of American journalism

in the New York *Times*, which he founded September 18, 1851, and conducted until his sudden death. A penny newspaper of wide circulation, it was independent of party and avoided class appeals; it specialized in news reporting uncolored by any cause, faction or personal feeling; and in editorial policy studiously refrained from the heat, abuse and misrepresentation then common. Raymond struck the note of the *Times* when he announced in his first issue that “we do not mean to write as if we were in a passion.” Avoiding the eccentricities of Greeley, the sensationalism of the elder Bennett and the vehemence of party organs he furnished the first important model for the moderate, unbiased and neutral journalism which has since become widespread. While taking many lessons from the London *Times* Raymond sought a broader, more diversified newspaper of interest to all members of the family. His success increased a capital of \$100,000 to more than \$1,000,000 in eighteen years and by stimulating the development of a school of imitators elevated the level of the American press.

In politics Raymond displayed the same shrewd moderation as in journalism. He was one of the founders of the Republican party at its Pittsburgh convention in 1856 and wrote its first platform. A close friend of Seward, he made the *Times* during the Civil War an invaluable supporter of the Lincoln administration, which was being assailed by radicals like Greeley. He did more than anyone else to bring Andrew Johnson forward for vice president in 1864, and as chairman of the National Executive Committee that year he managed the Lincoln-Johnson campaign. He stood behind Lincoln’s moderate war aims and when Johnson became president, he made the *Times* the foremost Republican newspaper in support of Johnson’s reconstruction policy, which he defended ably as representative in Congress from 1865 to 1867. Estrangement from Johnson followed. Raymond removed from the Republican Executive Committee, withdrew completely from politics and gave the last two years of his life entirely to his newspaper.

RAYMOND DE PENNAFORT (c. 1180–1275), theologian and canonist. Raymond, who was a native of Catalonia, was a member of the Dominican order and its third master general (1238–40). While at Bologna, where he taught until 1219, he produced a *Summa iuris*, a treatise on canon law divided into seven parts. By order of Pope Gregory IX, who summoned him to Rome in 1230, he edited the first official collection of the *Corpus juris canonici*, the *Decretales Gregorii IX*, completed in 1234. This work, destined to remain until the twentieth century as the fundamental code of canon law, is a compilation of previous documents, especially from the period of the *Decretum* of Gratian, but represents coordination and adaptation as well. Raymond also prepared an improved edition of the constitution of the Dominican order.

His chief and most original theological work is a *Summa casuum*, or *De poenitentia et de matrimonio*, begun between 1223 and 1234, which in primitive manner was divided into only three sections: sins against God, sins against one's neighbor and various canonical matters concerned with penitence and remission of sins. The fourth section, the *Summa de matrimonio*, is a later addition (after 1234) and is nothing more than Tancred's *Summa de sponsalibus et matrimonio* adapted to the Decretals of Gregory IX. The influence of the *Summa* was considerable, not only among the preaching friars but also at the University of Paris in the thirteenth century. It was glossed by William of Rennes (Redonensis) and Jean de Fribourg, a fact which testifies to its great importance. The numerous *Summae confessorum* of the thirteenth and fourteenth centuries were inspired by it and the more extensive *Summae* of the fifteenth century still show its influence. Practical in purpose, it was addressed to confessors.

RAYNAL, GUILLAUME THOMAS FRANÇOIS (1713–96), French historian. Raynal was educated in a Jesuit school and took priest's orders. Later he abandoned his religious career and devoted himself exclusively to writing. His place in history is based entirely on a single work, the *Histoire philosophique et politique des établissements et du commerce des Européens dans les deux Indes* (first edition without name of author, 4 vols., Amsterdam 1770; definitive edition, 10 vols., Geneva 1780). This compendious and declamatory historical work, in which Raynal had the assistance of numerous collaborators including Diderot, had a phenomenal circulation in France despite the prohibitions launched against it by the government and was translated into most of the European languages (English translation by J. O. Justanond, 3rd ed. 5 vols., London 1777). It is important today not from the point of view of historiography—as a book of history it suffers from a lack of first hand information and reliable documentation—but as a "best seller" which both expressed and influenced the minds of its contemporaries.

The *Histoire des Indes* served for its contemporaries as a sort of colonial encyclopaedia, catering to their taste for exoticism and political economy. In the latter respect it may be said to have expressed the mean level of economic opinion of the day. It was bitterly opposed to mercantilism, championed moderate physiocratic doctrines but was in no way original in the ideas it presented. It served also as a work of propaganda which helped to make way for the cataclysm of the French Revolution. Starting from an attack upon the colonial regime of the European countries, it went on to combat both monarchy and ecclesiastical despotism. The opinions, often contradictory, of Montesquieu, Voltaire, Rousseau, Helvétius and Holbach are lumped together to show the ravages of the despotisms of church and state. These despotisms violate liberty, the first of the natural rights of man and one which may be deduced either in the name of God or in that of the natural social order. In the application of his doctrine to France Raynal argued that since the absolute monarchy was consecrated by the Catholic

church, which proclaimed it as of divine right, the conquest of liberty was predicated upon the destruction of Catholicism and of all other doctrines which admit a supernatural order. The irreligious and anticlerical spirit of the *Histoire des Indes* had a direct influence in inspiring the sectarian policy of the French Revolution, which Raynal, incidentally, was one of the first to denounce in a celebrated *Adresse* written to the Assembly on May 31, 1791 (English translation, London 1791). In this manifesto he showed himself quite disconcerted over the fact that the sovereign people was revealing itself in the name of the great liberal principles an accomplished tyrant, terrorizing its own members through the organ of its representatives.

RAYON. *See* TEXTILE INDUSTRY; SILK INDUSTRY.

REAL ESTATE, if defined as land and the improvements upon it, constitutes nearly half the entire wealth of the United States. The term is ordinarily restricted, however, to urban land and its improvements, and the major portion of the following discussion will center about urban land development and transactions. Real estate as a business comprises the activity of those persons who engage directly or indirectly in the development, merchandising or management of this commodity. Predominantly a personal service business, it affords a field of activity for an ever shifting group of men and women whose income in the United States alone certainly exceeds several billions of dollars annually. According to the 1930 census over 240,000 persons in the United States earned their livelihoods in transactions in real estate.

The real estate business became a reality only when property rights in land and its improvements became clearly defined and subject to inheritance, sale, lease and other forms of transfer. In so far as the real estate business has any primitive origins, they are connected with the

transfer of title. Not only were all early forms of transfer of title cumbersome, but in many periods transfers other than by conquest were virtually impossible. While transfer of real estate still remains complicated, alienation (the right to transfer) has been greatly facilitated. Primogeniture and entail have lost their importance, and the principle of free alienation is so distinctly a part of the modern property system that contracts or laws in its restraint are consistently condemned as contrary to the public interest. With increasing ease of transfer and with greater variety in the uses of land there developed an organized market for real estate; and as the number, character and value of the units became more varied, an ever larger number of middlemen began to find employment in the real estate business.

While the real estate business is essentially a modern activity, its Greek and Roman antecedents are not without interest. In Greece the city was almost the exclusive property owner, but private agencies were established to manage properties, collect rents, plan and erect buildings and carry out similar tasks. The rent collector, however, performed a function different from that of the present real estate operator, whose major role is to convince prospective purchasers that real estate values are about to rise or that real estate is a desirable or useful investment. The Roman property system probably represented the first opportunity for real estate business activities at all similar to those of modern times. Private property and individual initiative were part of the Roman philosophy. Investments in lands and buildings were held in high regard. A rather complicated legal system with respect to land titles required the services of men with legal training for the transfer of land, and all these factors combined to initiate a system of real estate sales promotion.

Further development in this direction came only with the decline of the feudal system and the profound changes in economic life generally and in the uses of land in particular resulting from the industrial revolution. Urban living tended to sever people's attachment to the land. As money incomes increased, real estate in the rapidly growing cities was found to be a logical place for the investment of surplus funds. A prosperous man might own several buildings, but he held them primarily as investments and had little time to devote to finding tenants, collecting rents, financing and repair. As sales and trades became more frequent, people from all

walks of life found opportunity to engage in such work. Legal training was necessary for those responsible for the technicalities of transfer, but with this exception no qualifications were expected or required of operators in this field. However, in England the barristers and in other countries the notaries were the prominent figures in real estate transactions. The problems of describing and measuring the land soon became associated with its transfer, and the surveyor also became active in this connection. In fact today many participants in English real estate transactions are spoken of as surveyors, and the oldest leading professional society in the business is known as the Chartered Surveyors' Institution.

The colonization of North America created opportunities for frequent land sales and vigorous settlement activities. While the initial allotments of territory were not the result of sales or promotional efforts, land sales and speculation grew more and more important as the country developed. The settling and selling of land in the United States were stimulated by growth of population and by European demands for foodstuffs and raw materials and were further encouraged by constantly rising land values. The latter created a real estate market activity characterized by frequent speculative excesses. The depression of 1837 was essentially a reaction from hectic land speculation in which real estate boomers in top hats and frock coats sold land of all descriptions, completely bogging an immature and inadequate banking system with real estate paper. All of the elements necessary for a vigorous real estate business were early present, especially in the northern and middle western sections of the country. Holdings were comparatively small, and ownership by the user was the rule. In the south, where the plantation system prevailed, opportunities for real estate activity were restricted to a few cities. The "real estate man" in early American history was usually a northerner. It should be remembered, particularly in connection with homestead laws and other governmental land policies, that "go west" movements, while a part of national policy, were to a substantial extent the result of private enterprise, of land agents and their organized propaganda about the golden opportunities of the west. Individual states and later the railroads joined in land booming, in their efforts to dispose of their large subsidies from the several government agencies. As a result the frontier moved quickly

across the continent, accompanied by almost successive waves of rising land values and real estate activity.

The modern real estate business in the United States is carried on under a variety of forms of business organization. On the one hand, thousands of individuals conduct such business without office organization or capital. At the other extreme are individuals and organizations with elaborate business quarters and large sales and clerical forces, often including several hundred persons. As in other enterprises there has been a trend toward specialization of functions, although the single headed broker or the small partnership has not hesitated to carry on any phase of real estate activity in which ingenuity or effort could make a commission or profit. The nature of the business is best indicated by an analysis of the different types of activity it involves, but it must be remembered that while scattered individuals or firms confine themselves exclusively to one type of activity, it is more common for individuals and organizations to perform several functions.

Earlier activities were concerned almost exclusively with brokerage and land development. And at the present time most persons in the real estate business are brokers or brokers' employees. The primary concept behind such activities is that of agency for a fee or commission. Transactions ranging from the sale of valuable business properties to the sale of homes and vacant sites are included under the category of general brokers' business. Indeed the varieties of brokerage activity almost defy classification. Even here a degree of specialization exists: certain brokers give their principal attention to long term leases; some to industrial property where peculiar problems of building construction or railroad facilities are involved; others to a limited downtown central business district; and still others to small residences, apartment properties, and even location and leasing of chain store units. Brokerage is the predominant activity and the only so-called specialized function in which almost every person engaged in the real estate business pretends to participate. There has been much discussion as to the extent to which dealings in the real estate market have been augmented and stabilized and a beneficial transfer of property has been developed as the result of brokers' activities. While undoubtedly substantial services have been rendered, there is no question but that the charges per unit of transaction are very considerable. An odd prac-

tise prevails in the United States, where it is the seller who pays the commission and theoretically is represented by the broker. In fact, however, the broker is essentially a salesman, a go-between without special interest in either party, seeking only to arrange a sale.

Of more recent importance as a type of real estate activity is property management. Steel construction and the elevator have encouraged concentration of residential as well as business accommodations within a small area. The need for management of office buildings, apartment houses, hotels and various types of rented business property has resulted in the development of specialists qualified to rent and manage this kind of real estate. For such specialization technical knowledge and ability are more important than the sales capacities so fundamental in brokerage. As a result the training and capacities of persons engaged in property management are probably superior to those of other groups in the real estate business. Property management activities are also better adapted to large organizations, which are less subject to the vicissitudes of varying business conditions. It is probable that an increasing proportion of the individuals engaged in the real estate business will concentrate in this field as the industry becomes more mature.

A third type of real estate activity is that of the builder. While the bulk of the construction of large properties is in the hands of specialized construction firms and under architectural supervision, a very substantial amount of the building activities of the United States is carried on by persons considered to be in the real estate business, often spoken of as operative builders. In larger cities they build, sell and operate apartment properties. Much home building is also carried on in connection with the real estate business, and many large real estate firms, particularly those engaged in land development, have building departments. Many single family dwellings, often in operations involving tens or hundreds of homes, have been built by persons in the real estate business, although as a rule the economies possible in large scale production have not been realized. With some outstanding exceptions builders from within the ranks of the real estate business have not been associated with programs for better or lower cost housing or community planning. In the main they have operated within the general standards of building ordinances and must take the chief responsibility for row houses and many of the jerry built structures of the country.

An interesting phase of specialization, growing out of a combination of brokerage and building, has been the construction and sale of co-operative apartments in a number of the larger cities of the country, particularly New York and Chicago. In these buildings the property is held in the name of a corporation, while the apartment occupant virtually owns the space he occupies under a long term lease through stock ownership in the corporation proportionate to the equity value of his apartment.

Another major type of activity is that of subdividing or purchasing acreage tracts of land, usually on the fringes of cities, cutting them into lots suitable for home sites and selling these lots with or without such improvements as streets, sidewalks, sewers, water and other utilities. For such activities subdividers have been praised, on the one hand, as pioneers and city builders and denounced, on the other, as land scalpers and exploiters of uninformed people. Undoubtedly considerable subdivision activity has been predatory, based only upon seemingly plausible arguments about land value increment to come from a hypothetical city growth and ultimate utilization of the land. In the sale of subdivision property some of the least commendable sales activities in the United States have been employed. "Chump chariots," "bird dogs," "pitch men" and a galaxy of high pressure sales tactics have been used. Properties have been sold as city lots while even the farm fences remained standing. In contrast to such activities are projects that include development of the land and preparation of real home sites which are immediately usable and whose value is established. To an increasing extent subdividers are combining home building with development work, saving purchasers the risks and inconveniences attendant upon individual home planning and construction.

Nevertheless, some of the outstanding investment tragedies suffered by individuals in the United States have occurred in the vicinity of large cities, where the subdivider (the modern version of the old land boomer) has laid out lots in home sites far beyond the needs of the city for decades to come. There is no phase of the real estate business where the results of unbridled acquisitiveness are so permanent, for it is in the planning and sale of individual home sites that the almost final pattern of housing and community building is determined. Although subdivision development is a large capital operation requiring an unusual combination of creative,

planning, architectural and sales capacities as well as financial strength and operators on a subdivision development basis are therefore not numerous, subdividers' operations have generally not covered sufficiently large areas for the voluntary development of adequate and co-ordinated street layouts, lot sizes and other items essential to community planning. Here more than in any other phase of real estate activity there should be coordination with city and regional programs and a vigorous regulation of activities from a physical and an economic point of view.

Since 1900 there has been a rapid development of property valuation as a specialized branch of real estate activity in the United States. In the past brokers almost without exception felt themselves qualified to earn appraisers' commissions, but appraisal is clearly the work of a specialist. Although the standards of efficiency attained in rating and valuation work in England have not yet been reached in the United States, the results of this type of specialization should be very significant in the development of sound building and land purchase policies and in the placing of real estate investment on a less speculative and haphazard basis. Many students of land values and real estate investment are convinced that in the past, with notable exceptions, investments in real estate have produced much lower yields than is generally supposed. Considerable attention has been given to real estate appraisal in some universities as well as in the real estate trade associations.

Real estate financing presents another problem. Many individuals and organizations in the real estate business negotiate mortgage loans. In some cases the mortgages are made and sold to private investors among the clientele of the real estate or mortgage broker; on other occasions the mortgages are negotiated on behalf of some large institutional lender often located outside the community. The more recent tendency in the placing of mortgage loans has been to eliminate the commissions and participation of men in the general real estate business. Community financing institutions have found such services to be merely an added cost to the borrower. In the case of smaller mortgages the virtual monopoly of the field by real estate interests has resulted in short term loans, which increase the frequency of renewal commissions, rather than long term amortized loans suitable to the needs of the borrower. The need for some

other type of real estate financing is one which has not yet been met adequately in the United States. Before 1929 large unit financing handled through real estate organizations was tending more and more to take the form of the sale of real estate bonds. But this tendency has come to be discredited because of the inflated appraisals on which the loans were based and the resultant receiverships and bond depreciation.

Most individuals and firms in the real estate business participate in a variety of collateral activities. For example, practically without exception insurance is written by real estate brokers. In contrast to English custom real estate is bought and sold for quick turnover by persons and firms otherwise engaged as agents or brokers. Some persons and groups sell vacant land on a speculative basis through what is termed syndicate participation. Some act as administrators or executors of estates which consist largely of real property. Most real estate offices act as amateur law firms in connection with contracts, deeds, mortgages, notary services and the like. Others serve small community home financing institutions, such as building and loan associations and mortgage companies.

In the past the bulk of the real estate business in the United States was sustained by interest in speculative gains, by residential development and by other situations resulting from the growth and shift of population and a long, continued upward trend in the price level. These conditions and many of the business opportunities growing out of them are perhaps phenomena of the past, and it is likely that non-speculative transfers and intelligent utilization and management of real estate will come to form the bulk of the business.

Up to the present moreover the real estate business has been distinctly episodic. Since it requires little capital, the numbers engaged in it have multiplied rapidly in prosperity periods; and since the income is dependent upon commissions and transfers rather than on week to week or month to month services, a major exodus has taken place in depression periods. It is estimated that the number of persons engaged in the business either full or part time at the beginning of 1933 was approximately one half the number participating in 1927. The volume of sales clearing through general brokers' offices and sales of subdivision property probably has a wider swing in the transitions from prosperity to depression and back to prosperity than is true of general business activity.

Impatience with the promotional and speculative activities of the real estate industry is increasing. While it may be argued that Berlin and Chicago in the 1890's and Los Angeles and other cities more recently were examples in part of the pioneering and vision of the real estate man, the public has paid pretty dearly for this phase of private initiative and individualism. Growing recognition of the public interest and the need for public control over building and land development as well as over the personnel may be expected to result in decreased emphasis on qualities of salesmanship and more on essential business judgment, training and capacity, while the adoption of national housing and planning policies will stabilize the conditions under which the industry must operate.

Specialization not only offers opportunities for developing technique, but it encourages the more successful men in a business to establish standards of practise and ethics which will bring public approbation and protection for themselves against border line or substandard conduct. There has already been a groping for semi-professional status among the members of the real estate business in the United States. But it is in England that the business has reached greatest maturity. Its position is maintained through education and apprenticeship and the establishment of ethical standards by professional societies. The English professional real estate societies stand out as models for the rest of the world to follow. There are four principal societies: the Chartered Surveyors' Institution, the Auctioneers' and Estate Agents' Institute of the United Kingdom, the Land Agents' Society and the Incorporated Society of Auctioneers and Landed Property Agents. The oldest and most advanced is the Chartered Surveyors' Institution, which was granted a royal charter in 1881; in the same year the examination system for admission to membership was introduced. Out of the more than 20,000 candidates who presented themselves for the professional examinations between 1881 and 1930 about 12,500 were successful. Moreover the institution disciplines its members and expels those who do not live up to requirements. In 1933 there were approximately 8000 members. The Auctioneers' and Estate Agents' Institute, with a membership of over 6000 in 1928, ranks next in importance. Since 1921 it has also had compulsory examinations for membership. While voluntary sale of real estate by auction has never been popular in the United States, it is carried on extensively in

England and to a lesser degree in some of the other European countries, notably France, where it is felt that auction of property, after advertisement by a reputable firm, will bring the highest possible price. The institute has its headquarters in London, where a palatial building houses the staff and library. Branch offices are located in the various cities, where they can deal more effectively with matters of local interest. The institute provides a mart which may be used upon payment of a fee by members who have lived up to rules pertaining to the advertising of the property to be sold. All transactions are recorded and are open to inspection by all subscribers. The other two societies are organized and work along much the same lines. All encourage professional education in the universities, sponsor helpful legislation and through membership restrictions maintain a high standard, which results in a very definite benefit to the public.

In the United States the National Association of Real Estate Boards has made substantial efforts to improve the standards of conduct in the real estate business. The term *realtor* is owned by the association and may be used only by members. Membership and use of the trade name are conditioned upon agreement to abide by the rules and code of ethics of the organization. The control here exercised is largely voluntary on the part of the individual, although some of the constituent boards have maintained very high standards of business conduct and responsibility. The national organization has encouraged education and the extension of public licensing as a supplement to its own self-imposed standards.

In Europe the real estate business is in general less well organized than in England or even in the United States. In most European countries the transfer of real property is less frequent and the procedure more cumbersome. The notary public is a much more important personage than in English speaking countries; he is often appointed by the government and is the agent through whom the bulk of real estate transactions is made. Most countries have laws requiring a public record of documents affecting the transfer of real estate. In France the law stipulates that all property sales shall be published in official journals and that no sale can be consummated until at least forty days after first publication. The notary prepares the deed, registers the sale and attends to all legal matters in connection with the transfer. There are a

considerable number of persons who conduct rental and brokerage businesses; many sales moreover are made, as in England, through public auction, and real estate men rather than notaries usually advertise and conduct such sales. But the high cost of transfer and relatively stable land values lessen the number of sales and trades as compared with the United States. In Switzerland property seldom changes hands. Transfers when made are cumbersome and require expert legal talents. In another country a purchaser must hold a property approximately twenty years before he can receive a final document evidencing ownership.

In the United States public control of the real estate business has tended to concentrate on regulating the conduct of the persons in the business through license laws. More than half the states have provided by statute for real estate licenses; real estate brokers and salesmen in their employ must have licenses before they may accept commissions to act as agents in real estate transactions. This type of control therefore covers only the agency aspects. In some states a license is not granted unless the applicant has passed a more or less difficult examination designed to test his technical knowledge or competence; but in most states licenses are granted virtually to all who apply, provided they pay the required fee, usually ten dollars or less per year. Universally, however, the laws stipulate that the licensing authority may revoke or refuse to renew licenses, if upon a proper showing it is demonstrated that the licensee has violated certain standards. While establishing certain minimum standards of conduct and thereby eliminating the most vicious procedures, such public control cannot hope to improve practices above those already common to a substantial majority of the business. It may be expected that as general business standards are raised through education and directed effort of the trade associations, those of public regulation will follow. But major dependence in this type of control must rest upon voluntary action.

Land planning and restrictions on land utilization exert a different form of control on the real estate business. One of the results of such activity is the stabilization of land values as well as of land uses and thereby the elimination, to a certain extent, of speculative possibilities. The more far sighted members of the real estate business have welcomed such measures, recognizing their own dependence in the long run on satisfaction of the public interest. The earliest

efforts in this direction were the zoning laws, which sought to eliminate conflicts of real estate uses in adjacent areas and required approval before recordation of subdivision plats. More recently community and regional plans have come into prominence and in a few places into operation. Programs for public housing and long time planning of land utilization point the way to possible future developments.

REAL ESTATE TAXATION. *See* PROPERTY TAX; GENERAL PROPERTY TAX.

REALISM. The original intention of the term realism is to assert the existence of real things as opposed to the products of the mind, which, in so far as they are fancies and imaginations, are considered not to be real things. It is, however, a word which has been used with a considerable variety of meanings.

The term is first applied in philosophy to Plato's theory of forms. Socrates is credited with the doctrine that universals possess a more real

existence than physical things. What Socrates chiefly had in mind, it seems, was mathematical concepts, such as number and triangularity, and moral concepts, such as justice and virtue. This view is the basis of Plato's celebrated theory of forms, or ideas. The question which the theory is primarily designed to answer is: Why do things come to exhibit qualities which they had not before or to lose qualities which they had? The answer is that they exhibit or lose such qualities because of the presence in or absence from them of certain non-material forms. For example, a thing becomes beautiful because the form of beauty is present in it; it ceases to be beautiful because the form is withdrawn from it.

The forms were conceived by Plato to constitute the real world, a world of immaterial logical entities, permanent, perfect and changeless, standing in immutable relations to one another. The forms are not only not thoughts in a mind but they are independent of any mind, human or divine. For this reason the use of the word ideas to denote them is highly misleading. For this reason also Plato's doctrine may be said to constitute the earliest form of what is known as conceptual realism. Conceptual realism not only makes the negative assertions common to all forms of realism, that reality is not exclusively minds or a mind, is not thoughts in minds or a mind and is not dependent for its existence upon being thought about by minds or a mind, but positively asserts that reality includes certain immaterial entities, sometimes called universals, such as humanity, whiteness, triangularity, justice and so on.

It is this second positive assertion which constitutes the distinguishing tenet of scholastic realism. Scholastic realism, of which the most prominent exponent was William of Champeaux (c. 1070-1121), maintains, following Plato, the independent reality of essences, potentialities, principles, causes, which are conceived not as ways of representing facts or as the properties of things, but as independent agencies which are responsible for the occurrence of the phenomena they are invoked to explain. Because a stone fell to the earth when dropped, realist philosophers were inclined to say that it possessed a "principle of gravity" which caused it to seek the earth's center; the fact that quinine prevents a cold would be explained as due to its possession of a "cold-forbidding essence," which would be thought of as a form with which the material of quinine had combined. The doctrines of

scholastic realism were criticized by the nominalists, who maintained that universals, essences or forms were nothing but the general names by means of which we denote the common qualities possessed by different objects. There were therefore in the nominalist view no such independent entities as "whiteness" or agencies such as "cause," "whiteness" being simply the common quality of cream and snow, "cause" a relation between events.

With the decline of scholastic philosophy at the close of the Middle Ages the center of philosophical interest shifted. There began the vogue of idealism, first subjective and subsequently objective; and, if we except the work of the Scottish philosopher Thomas Reid (1710-96), who maintained a realist theory of knowledge in order to urge the claims of common sense, idealism may be said to have held the philosophical field practically unchallenged until the end of the nineteenth century. Thus it is not until comparatively recent times that realism reappears in a new guise as a specifically modern theory. The starting point of the realist revival is to be found in two articles which G. E. Moore contributed to *Mind* at the beginning of the twentieth century ("The Nature of Judgment" and "The Refutation of Idealism" in *Mind*, n.s., vol. viii, 1899, p. 176-93, and vol. xii, 1903, p. 433-53); the first deals with the theory of perception, the second with that of concepts. These two theories, which constitute the two main strands of modern realism, may be most conveniently considered separately. Common to both is acceptance of the maxim enunciated by the Austrian philosopher Meinong (1853-1920): "That there cannot be an act of knowing without something to know, or more generally that there cannot be an act of judging, even an act of apprehending at all, without something to judge, something to apprehend, is one of the most self-evident propositions yielded by a quite elementary consideration of these processes."

The application of this maxim to the problem of perception has resulted in a number of theories which have little in common except their affirmation of the independent existence of the perceived object. As soon as the questions are raised, "What sort of object is the object perceived?" and "What is the nature of the mental activity by which it is known?" wide divergencies of view are apparent. Perhaps the best known of the various views is that which asserts that the objects known in immediate

sensory experience are sense data, or *sensa*. This view has been put forward at different times in England by G. E. Moore, Bertrand Russell, P. T. Nunn, C. D. Broad and others and in the United States by the contributors to *The New Realism*. Sense data are defined by Bertrand Russell as "the things that are immediately known in sensation: such things as colour, sound, smell, hardnesses, roughnesses and so on."

The view of the external world as consisting of independent entities (sense data) which are revealed to the mind of the perceiver exactly as they are has afforded a philosophical background which is in the main congenial to the natural sciences. If the part played by the knowing mind in our knowledge of the external world is merely revelatory, it follows that problems of epistemology may be ignored by the scientist. "Out there" in space is a directly revealed world of external fact; all that the scientist has to do is to explore it. Realism has borrowed in its turn from the natural sciences certain mental habits. In the first place, it has adopted from science the method of tackling its problems singly. It is not the case, as idealists have supposed, that it is necessary to know the whole truth about everything in order to be able to assert some true propositions in regard to particular problems. Refusing therefore with one or two exceptions, such as Professor Alexander, to commit themselves to all-embracing metaphysical systems—many realists indeed have denied the possibility of such systems in the old sense—realists have isolated their problems and tried by careful logical analysis to find out exactly what could and what could not truly be said on particular issues.

In recent years, partly on account of the epistemological difficulties which realism has experienced in defining the relation of sense data to physical objects, partly on account of the changing trends of physics, the alliance between science and realism has tended to break down. Not only is the relation of sense data to physical objects obscure, but sense data are completely foreign to the world affirmed by modern physics. Moreover the world of modern physics is not directly perceived; hence it is difficult to avoid the conclusion that it is somehow constructed from the world which is perceived. As a result there is a new insistence on the activity of the mind in scientific thought. This has led to a wide acceptance of idealist views by contemporary physicists, who have not hesitated to acclaim the

activity of the mind in constructing not only the scientific but the familiar world. Thus Kant has taken the place of the realists as the philosopher most congenial to modern physics.

In its application to ethics and aesthetics modern realism has taken the form of a conceptual realism, not unlike the Platonic theory of forms. In *Principia Ethica* G. E. Moore contended that goodness is an ultimate and objective subsistent entity which cannot be further analyzed but is intuitively perceived; he also made the same claim for the subsistent truth. The result is a utilitarian ethic, so far as means are concerned, a right action being defined as one that has the best actual consequences on the whole; and an intuitionist conclusion in regard to ends, the best consequences being defined as those which contain the greatest quantity of such ultimate goods as virtue, truth, beauty, which are intuitively perceived to be valuable. An analogous doctrine has been suggested in aesthetics by Roger Fry and developed by Clive Bell and others. Bell in his book *Art* contends that "significant form" is the distinguishing characteristic of a work of art. It is, he holds, in virtue of their possession of significant form that we experience aesthetic emotion in contemplating such works. The doctrine implies (although Bell does not explicitly draw the implication) the metaphysical conception of an absolute and objective beauty, whose presence in the object confers significance upon it.

It is largely through its alliance with the scientific outlook—an alliance which, as has been said, continued until the rise of the new physics and which indeed is still operative on the cultural levels of thought—that philosophical realism has had any direct bearing upon the social sciences. It has formed part of the general reaction from objective idealism, which has led to the decline of the Hegelian view of the state and has contributed to the growth of political pluralism, which involves the affirmation of the independent integrity and real rights of bodies, such as corporations and trade unions. Just as realism affirms the reality of things apart from minds and of parts independently of wholes, so political pluralism affirms the reality and the rights of bodies within the state independently of the state.

REASON OF STATE is one of the more important of the concepts which have contributed to the building up of a rationale of the absolute state. First widely used in the sixteenth and seventeenth centuries to rationalize the ruthless employment of political power, it was taken over into the theories of nineteenth century nationalism and imperialism and has a current importance with the ascendancy of new dictatorships and new absolutisms.

The concept is the historical root for the fundamental category of purposive or objective rationality in political behavior. Political behavior is objectively rational (Max Weber's *Zweckrational*) when it is adapted to creating, preserving or expanding a configuration of social relationships in terms of power; subjectively rational behavior, on the other hand, is rational in terms of ideas or values. To be sure, actual behavior will rarely be objectively rational unless there is a conviction that the object to be attained is valuable. There is nevertheless an important difference between a study of ideas, values or norms and one of the means employed in their realization.

Machiavelli, who is often—but incorrectly—regarded as the originator of the concept of reason of state, affords in his writings a striking confirmation of this distinction as well as an indication of its limitations. For his ideas not only revolve around the problem of the necessary conditions of successful political action but tend to confirm his (subjectively rational) faith that the state, or organized political community, is the highest of all goods, because it is the condi-

tion of all good life. This faith he shares with classical antiquity, with Plato, Aristotle and Cicero. Built as it was upon the three ideas of pagan virtue, or manliness, *fortuna* and *necessità*, it made a rationally coherent whole in the mind of Machiavelli and in those of his contemporaries who had lost faith in the teachings of Christ as interpreted by the church. To those who had not thus lost faith it was shocking heresy. But some of the latter, like Botero, attempted to salvage the "truth" contained in Machiavelli's passionately detached analysis regarding the conditions of successful political action. So far reaching was its influence that strictly anti-Machiavellian writers, like the Calvinist Johannes Althusius, became deeply concerned with these problems. Meinecke, in his magistral volume on reason of state, while protesting that "the rich content of the idea of reason of state cannot be enclosed within the narrow limits of a definition," indicated what is commonly understood by the term: it is the principle of political action, the law of motion of the state. It furnishes the guiding principle for the statesman in fulfilling his function of maintaining and strengthening the commonwealth, according to Meinecke an organic configuration whose full strength is maintained only if it can somehow continue to grow.

It is evident that the specific content of the concept at any particular time must be affected by the nature of the state or government involved. Machiavelli and his followers, Hobbes, for instance, were inclined to look upon government as a mechanical system applied to human beings molded according to unalterable natural laws. Others, like Bodin and Althusius, who clearly perceived the inapplicability of Machiavelli's generalizations to local conditions as they knew them, attempted to analyze regional or national variations affecting not only individuals but the system of rule to which they might successfully be subjected. As against such internal variations Richelieu and Pufendorf stressed the variety of external conditions which make certain actions rational for one government and irrational for another. Such differentiation is indeed not entirely lacking in Machiavelli and Botero, who were concerned, for example, with differences between the policy of large and small states. But it is only with the increasing nationalism of the eighteenth and nineteenth centuries that reason of state comes to be conceived as strictly limited to one national state and its peculiar genius. The pinnacle of this

trend, with its implied abandonment of valid generalizations, is reached with Hegel and the historical school for which he provided the impetus. Curiously enough Marx' use of Hegelian dialectics provided the most effective challenge to this individualizing trend. The broad generalizations of the *Communist Manifesto* forced those interested in combating its political implications to seek more accurate generalizations about the conditions of successful political action. In this endeavor they were met by those whom the random generalizations of Rousseau's political gospel, as applied in the French Revolution and its Napoleonic aftermath, had aroused from their dogmatic slumber. There resulted during the nineteenth and twentieth centuries a rising tide of more or less serious inquiry into objectively rational political behavior, which crystallized into modern political science.

In spite of its importance in European literature the concept of reason of state has played a negligible role in English and American political theory. This is largely because the concept of the state as a corporate entity above other social groupings has never become established in Anglo-American thought. On the other hand, the policies of both countries provide many illustrations of that subordination of other ends to the maintenance and expansion of the state which are the essence of the concept. The phrase manifest destiny embodies a less scholarly appreciation of reason of state which uses individuals as mere agents in the "inevitable" forward thrust of political power.

More objectively viewed, these principles of political action become raw material for the science of politics. Whether or not such inquiry can be divorced from a belief or faith in the state as the highest good depends upon whether its conclusions are presented in definitive terms or as conditional hypotheses. Perhaps the greatest risk in such inquiry is that of becoming absorbed in the state or the church or the trade union or any other concrete configuration of power, and thus transforming a study of the conditions of successful political action into a social philosophy claiming ultimate value for such action.

CARL JOACHIM FRIEDRICH

REBELLION is frequently used in a broad sense almost interchangeably with such terms as insurrection and revolution. Statutes and courts of law do not generally distinguish a specific crime of rebellion but punish all uprisings as forms of treason. Such indiscriminate usage, however, fails to recognize significant variations in the causes and motivation of uprisings. It therefore seems desirable to employ the term rebellion in its narrower sense to denote an uprising of more or less significant proportions intended to effect territorial autonomy or independence but not complete overthrow of the central government.

This was its meaning in the Roman Empire, where the word *rebellare* was used to refer to the renewal of war by peoples which had been subdued. Rome conquered a world but failed to find a political system which would reconcile the traditions of a city-state with the military exigencies of holding down conquered provinces and defending far flung frontiers. The fall of the Roman Empire might be described as a series of rebellions in the provinces brought about in varying degrees by the ineradicable faults of military despotism, the collapse of the administrative and financial machine as a result of underlying economic causes as yet undetermined, the pressure of the barbarians outside and within the frontier and the very traditions of Rome which created within the provinces a tradition of their own. Before Augustus the provinces were regarded as the estates of the Roman people (*praedia populi romani*). They were ruthlessly exploited by governors, who had absolute power for one year. A system of money lending and tax farming developed with the connivance of the Senate; many punitive expeditions were little more than debt collecting affairs. The emperors proved incompetent not only in governing the empire but also in defending it. Neither the reforms of Diocletian, the division of the empire into east and west nor Constantine's acceptance of Christianity could arrest the forces of disintegration. As pressure on the frontier grew, self-protection drove some of the provinces to organize into independent kingdoms. Finally the empire split up in the west

into separate kingdoms under the leaders of revolting or immigrating troops: the Visigoths in Gaul and Spain, the Vandals in Africa and the Ostrogoths in Italy. What little is known of the administrative and military structures of the empires which preceded Rome suggests the same problems of rebellious vassal states and revolting troops (*see* EMPIRE).

China like Rome illustrates one of the fundamental patterns of rebellion—the collapse of a military and bureaucratic imperial machine under the pressure of internal corruption and the impact of unexpected forces on the frontier. The conditions which had secured the acceptance of thirty dynasties in China were destroyed by the impact of Europe in the nineteenth century. The leader of the Taiping Rebellion of 1853, T'ien-Wang, received from an American missionary a version of the doctrine of the Trinity in which he found a place for himself; his rebellion, aiming at the control of the entire empire, succeeded in ruling over the southern portion of the empire for eleven years and was subdued only with the assistance of western troops and guns under General Gordon. As the central government at Peking was weakened by the influx of western ideas, it was inevitable that the economic differences of regions whose centers were far apart should take on a political form. A China in contact with western ideas can be controlled only from Nanking, in the valley of the Yangtze, where the two civilizations meet. Attempts to maintain such control from Peking have proved unavailing. The Chinese empire has become a loose federation of quasi-autonomous provinces, governed by military *tuchuns* giving only a nominal allegiance to the central government. Some sections have become practically independent, among them areas under governments which are termed communist. The communist rebellions in China are peasant revolts rather than uprisings of an urban proletariat such as are contemplated by theoretical communism, but these elemental attempts to escape from an oppressive economic and military system have been seized upon and given form by political missionaries imbued with the communist ideal.

The reformation and the growth of nationality led to a confused pattern of rebellions by reason of the fact that religious beliefs did not coincide with national or dynastic boundaries. The growing power of the commercial classes challenged the arbitrary claims of kings, while the conflict of religious doctrines raised within each unit of government in Europe acute prob-

lems as to the nature of obedience. These conditions gave to western thought Machiavelli in Italy, Bodin in France and Hobbes in England; they caused the disintegration of Italy, the revolt of the Netherlands, the *Fronde* in France and the Thirty Years' War in Germany.

A new pattern of rebellion was produced by the relation, which began with the discovery of America, between the Old World and the New. The problem raised was more difficult and subtle than that of Rome and its provinces. Communications were less effective by sea than they had been by Roman road. There was not one empire but many: Spain, Portugal, France, Holland and England. Commerce and the beginnings of science made solution by military power, bureaucracy or the apotheosis of an emperor alike impossible. The rebellion of 1776 which created the United States testified to the failure to combine representation at the center with self-government at the periphery of a commercial empire. The colonial assemblies overcame the arbitrary power of the local executives in the persons of royal governors only to find themselves face to face with the sovereignty of Parliament. The compromises of constitutional monarchy were not adaptable to the conflicting economic interests of so diverse an empire. Since then the United States and the British Commonwealth of Nations have each attempted solutions of the same problem (*see* IMPERIAL UNITY). Incidents in the experiments have been the American Civil War, the Canadian rebellion of 1837 which led to the Durham report, the Irish rebellion of 1916 and the establishment of the Irish Free State.

In the empire of Spain the theory of colonial administration for three hundred years was that of centralized control by the government in Spain. The Creoles and Indians were practically disregarded in the governmental structure, which was in the main administered by a bureaucracy sent out from Spain but possessed of considerable independent control by virtue of the great distance from the home country. There were bloody Indian uprisings, such as that of Tupac Amaru (1780-83), which blindly sought by destruction of white property and lives to drive back the frontier and retrieve the land from white control. The rebellions which ultimately, in the first quarter of the nineteenth century, established the independence of the Spanish colonies in the New World were however, almost entirely the work of the Creoles dissatisfied with their subordinate social and

economic position and with the economic subservience of the colonies to Spain under the dominant colonial system.

The clash of economic interests which found its expression in the wars of independence was revealed also in rebellions attributable in a measure to the question of slavery. The American Civil War may be considered an attempt by a section of the country which had its basis in an agrarian slave economy to secede from a nation which was becoming increasingly dominated by a manufacturing free labor economy. In French Haiti the planters' unwillingness to abide by the action of the revolutionary National Assembly in France in abolishing slavery led to the slave uprising which succeeded in setting up a black Haitian republic under Toussaint L'Ouverture.

The most important cause of rebellion during the nineteenth and twentieth centuries, however, has been the rise of nationalism and the principle of national self-determination. Under their powerful impulse formerly independent units attempted to free themselves from subservience to other political units and to reestablish their independence. A long array of nationalist rebellions characterizes the period since the French Revolution. Many of these were successful, such as that of Greece in 1829, of Belgium in 1830 and of Bulgaria in 1878; others, such as the Polish rebellions of 1830-31 and 1863 and the Italian rebellion of 1831, failed, at least for the time being. In the case of Italy a series of rebellions reestablished small independent units, which were ultimately unified into a new national state. The successful rebellions were not always carried through by the rebel state itself; often intervention by one or more of the great powers decided the outcome of the rebellion.

Mention might be made of the role of imperialist aspirations in the fostering of rebellions. This appears perhaps only as a strong undercurrent in the rebellion which in 1836 converted Texas from a state of Mexico into the independent "Lone Star State," to be incorporated into the United States nine years later. It is much more obvious in the uprising in Colombia in 1903, which quickly, under the helpful eye of the United States, created an independent Panama and paved the way for the construction of the Panama Canal. In the case of the setting up of the puppet state of Manchukuo in 1932, the hand of Japan was so obvious that no attempt was made by the central Chinese government to contest the claim of independence.

In the empires of the ancient world before Rome moral justification for rebellion could be found in the claim that the terms of submission had been violated. Priests or soothsayers could no doubt find imperfections in the ceremonies of submission whenever successful revolt seemed possible. Under feudalism the relation of ruler and ruled was based on the idea of a reciprocal contract. There was a right of *diffidatio*, or of formal renunciation by a vassal of his allegiance to his lord, and of rebellion. The development of nationality in western Europe and the long tradition of unity, temporal and spiritual, that was the legacy of Rome and Christianity necessitated a justification for rebellion in the later Middle Ages and in the sixteenth century which was the beginning of the modern theories of the state and the nature of individual rights.

The justification for rebellion did not stop at the case for secession but went on to question the nature of communities among men. The very forces—the development of industry and commerce—which brought different communities into such close contact that they could not but face the question of the causes of their difference were found to be themselves a great factor in those causes. It had long been realized that behind the legalized rebellion of barons against an arbitrary king there was another rebellion, the "base and abject routs" of boys and beggars described by Shakespeare (*Henry 11*: Pt. 2, Act IV, Sc. 1). The economic interpretation of history marshaled the "base and abject routs" scattered through history into an advancing army. The proletariat soon loomed as large in political speculation as had the state of nature and the social contract. For the industrial revolution, by accelerating economic change, revealed the influence of that change on the fate of nations. With that increased rate of change the theory and practise of rebellion began to pass into the theory and practise of social revolution.

RECALL. The recall is a political device designed to enable the electorate, through a special election, to replace a public official before the normal expiration of his term of office. It differs from removal by judicial process, impeachment or executive action in that the decision emanates directly from the electorate, thus, in theory at least, affording a more effective popular control. The recall, which seems to have originated in certain Swiss cantons, appeared in America in the Articles of Confederation and was discussed in the Constitutional Convention. Nevertheless, its present use in the United States, where it has been of greatest significance, is the result of an entirely independent political movement.

Originally introduced in the Los Angeles charter of 1903, the recall, with the initiative and the referendum, soon rose to prominence in the program of the "progressive movement," which reached its height in Theodore Roosevelt's campaign for the presidency in 1912. Its spread was accelerated by the nation wide attention it attracted when it was successfully invoked to remove a conniving politician from the Los Angeles city council shortly after the provision had been introduced. It has been adopted in somewhat varying forms to apply to state officers in twelve states and to public officials in well over a thousand local governmental agencies. In addition to the constitutional provisions a number of states have statutory provisions applying the recall to local officers. Such provisions are common in legislation regarding the commission and commission-manager forms of government. The movement for its extension reached a halt in 1920, but there has been no concerted effort toward the abandonment of the recall and not infrequently it is still included in new municipal charters.

Five different types of recall have been instituted in the United States: the recall of elective officials other than judges, the recall of appointive officials, the recall of judges, the advisory recall of federal officials and the recall of judicial

decisions. The last, particularly as applied to decisions holding statutes unconstitutional, is more aptly classed as a form of referendum (see INITIATIVE AND REFERENDUM).

The only type which has been used extensively is the recall of elective officials other than judges. Lending itself easily to political controversy, it became one of the chief issues during the progressive period. Its opponents charged that the device would be abused for personal, partisan and factional ends, that it would destroy official independence and that it violated the American form of representative government. Its advocates looked upon it as a means of freeing the officeholder from dependence upon bosses and special interests, of giving the public continuous control of all officials and of making those officials constantly responsive to public will. As a result, they felt, it would increase the interest of the citizens in their government and would, at the same time, permit the necessary concentration of authority and responsibility and lengthening of terms of office. They believed that it would not be necessary to employ the recall very frequently; its mere presence as a "gun behind the door" would be sufficient in most cases.

The recall of appointive officials has been adopted only in Kansas and in a small number of local governmental units. Many of the exponents of the recall principle have opposed its application to administrative officers on the ground that it requires of the electorate a technical knowledge which the electorate generally does not possess.

The proposal to permit the recall of judges precipitated the most violent conflict of opinion. It was assailed on the ground that it nullified the independence of the judiciary and was bitterly opposed by most judges and by those who saw in it a threat to the privileges of property. Its defenders based their argument not upon the ability of the electorate to pass upon the correctness of technical legal decisions but upon the people's right to control certain acts of the judiciary which were termed essentially political rather than judicial. Such, they claimed, were the acts of judges in declaring laws unconstitutional on grounds which to the progressives represented blind adherence to outworn economic, political and social dogmas. Since in most states the judges secured their office through election, they were susceptible to the same influences as other elective officials and should be subjected likewise to continuous popular control. Despite

the terrific battle which raged about it the judicial recall appears to have been used not more than a half dozen times, in Arizona, California and Oregon. In practically all of these cases its use was based not upon specific technical judicial decisions but upon dissatisfaction with the performance of certain administrative duties and the lax application of certain criminal laws.

Two states have attempted indirectly to apply the "advisory" recall to certain federal officials, who are not directly subject to state law. In Arizona candidates for Congress are given an opportunity in advance of the election to agree to abide by a vote for their removal. That state provides further that the people may vote to advise the resignation of a federal judge having jurisdiction within the state and may at the same time recommend a successor. North Dakota by an amendment which was adopted in 1920 also attempted to apply the recall to congressmen.

Recall procedure in the United States, although subject to considerable variation, involves the securing of a valid, or "sufficient," petition which must state the charges against the official, the holding of an election to determine whether the official shall be removed and the choice of a successor. Most commonly the voters are called upon to vote for or against recall and separately, but on the same ballot, to select a possible successor. A second arrangement provides that the incumbent shall on the filing of a valid recall petition become a candidate to succeed himself in competition with other candidates; a third limits the election to the question of removal from office, with provision, should the recall succeed, for filling the vacancy by the usual method or by a second election. Certain safeguards for the benefit of the official are usually provided. Recall petitions may be prohibited for a certain period of grace at the beginning of the term or for a second time during a single term. The official is usually permitted to place on the ballot or the petition a formal statement in his defense. A few states refund the cost of the campaign to the official where the move for recall is defeated in the election.

The predictions of the originators of the recall that it would be used sparingly have been borne out. In only two instances has it been successfully employed against officials elected by an entire state: in 1921 against Governor Lynn J. Frazier of North Dakota, the attorney general and the commissioner of agriculture and labor;

and in 1922 against two members of the Public Service Commission of Oregon. It has been applied occasionally to state legislators and to judges of county courts. Its principal application, however, has been to elective officials in local governmental units. An extensive investigation in California, where it has apparently been employed more widely than in any other state, showed that from 1903 to 1928 a total of 208 recall petitions were filed, involving 434 officials, and 155 elections were held, of which 72 were successful in removing a total of 130 officials. It is of some significance that the number has tended to increase in recent years. From this limited investigation and others it is estimated that throughout the United States as many as 400 recall elections have been held, involving the removal of perhaps 300 officials, or an average of 10 each year.

Any adequate discussion of the causes of recalls would involve consideration of the underlying motives, impulses and frictions which influence the functioning of all democratic government. Officials have been removed for such trivial causes as the use of profanity in a public meeting and on such serious charges as connivance in the letting of public contracts. Recalls have been sponsored variously by political reformers, disgruntled taxpayers, opposing political factions, underworld interests, moral crusaders and even rival paving companies seeking exclusive business privileges. In the formal statements of the grounds for recall the most frequent charge has been "general incompetency and inefficiency," and an almost equally popular avowed charge has been "wastefulness and extravagance in the expenditure of public funds"; but these perfunctory declarations often fail to disclose the real motivating forces behind the recall movement.

The disquieting problems brought to light in the operation of the recall are mainly those generally related to the operation of democratic government. Unnecessary political turmoil has sometimes been aroused, needless election expenses have been incurred, and competent officials have been seriously embarrassed by short-sighted criticism and self-seeking factionalism. There is a growing tendency, however, for the recall to correct its own weaknesses; in those areas in which it has been too lightly applied sentiment has developed against its employment except as a last resort.

The recall has been invoked effectively in several instances to remove officials whose con-

duct was so subject to suspicion as to undermine public confidence in their integrity and services, while there was no possibility of legally proving official turpitude or malfeasance. It has found its most satisfactory application, however, in permitting the removal of elected officials who have arbitrarily run counter to the wishes of the electorate.

The most constructive and significant advantages of the recall are too intangible for more than general appraisal. It has permitted lengthening of the terms of office and shortening of the ballots without incurring the risk of the establishment of arbitrary bureaucracies. It has established the principle of responsibility and responsiveness to the extent that the public is capable of understanding it and of benefiting thereby. Finally, it has helped to maintain public interest and confidence, because the public knows that it possesses a potential weapon for controlling the government.

Outside the United States recall provisions have been marked by two outstanding characteristics. Aside from the Union of Soviet Socialist Republics, where the constitutions of the constituent republics provide that representatives to the soviet may be recalled by their constituencies at any time, European constitutions generally provide for the recall of the entire legislative body rather than of individual legislators. The first recall provisions in Swiss cantons were of this type, and even now this form exists in some cantons which do not provide for the recall of the executive. There is no record of any use of the recall in Switzerland. At least twelve German *Länder* provide for recall of the Landtag and nine for recall of municipal councils. The former provisions have been invoked eight times, and although no Landtag has actually been dissolved by a recall election, three have resigned with such elections impending. Wells lists twenty attempts to recall municipal councils, at least four of which succeeded. The second feature of the recall outside the United States is the provision for its application to the president; such a clause is found in the Weimar constitution, in the Austrian constitutional revision of 1929 and in the Latvian constitution. In all of these instances the recall of the president has been automatically and inversely connected with the recall of the lower house of the national assembly. In no case have these recall provisions been invoked. The National Socialist dictatorship has completely vitiated any significance which the recall may have possessed in Ger-

many, the only European country in which it has actually been used.

RECEIVERSHIP. In Anglo-American law a receiver is defined as an indifferent person between the parties who is appointed as a ministerial officer of a court to collect and hold rents, profits or proceeds of land or personal property and to distribute them to the party or parties finally found to be entitled to them. Receivership is an ancient device worked out by the Court of Chancery in England when it was ecclesiastical in personnel. Its function was to provide for such purposes as carrying on the estate of a dead man or administering the property of an infant, except in cases where the receiver was a mere stakeholder, holding a fund or piece of property until interests were adjudicated. The old institution is still occasionally invoked for these modest ends, as where a mortgage is foreclosed and during foreclosure a receiver is appointed to collect rents and hold them; or where a creditor asks that a receiver be appointed to realize assets of his debtor; or where a receiver is appointed pending dissolution of a partnership. But the major significance of receiverships today lies in the field of enterprises which are embarrassed financially. In reality receivers, particularly in the United States, have become operators of large business enterprises including industrial corporations and such major public utilities as railroads.

The importance of receivership in the United States may be gauged from the fact that at various times nearly 25 percent of the entire railroad system of the country has been in receivership, the receivers becoming virtually operators of this large fraction of the transportation system. Since 1870 there have been over one thousand railroad receiverships. The institution of receivership has been greatly extended in times of depression or shortly after. To the receiverships of railroads and large industrial enterprises must now be added large real estate

ventures. From January 1, 1917, to December 1, 1923, the United States District Court for the Southern District of New York, which is the leading eastern forum for equity receiverships, appointed receivers for 233 corporations with nominal assets above \$750,000,000.

There are two types of receivership in the United States: bankruptcy and equity receiverships. A receiver may be appointed in bankruptcy pending the appointment of a trustee. Not infrequently the person appointed by the court as receiver is later chosen by the creditors to act as trustee in bankruptcy, virtually continuing the same function. The bankruptcy act apparently contemplates the appointment of a receiver as an exceptional procedure, but the practise has grown nevertheless to great proportions. Bankruptcy, however, is best adapted to the purpose of effecting liquidation, while the equity receivership is invoked when the objective is reorganization. This is facilitated by the fact that the American test of bankruptcy is not the inability to meet maturing obligations but an excess of liabilities over assets. The equity receivership is thus suited to the situation of a concern in temporary financial difficulties and has become the favorite form of receivership. It was the only resort in the case of railroads, which were debarred from the benefits of bankruptcy proceedings.

The operating receivership in equity may be of either state or federal origin, but in large enterprises the federal court is the usual forum. The federal equity receivership is usually a "consent" receivership. Because of the diversity of citizenship of bondholders, creditors and corporation entry into the federal courts is easy. In a formal sense the procedure is collusive. Receiverships have been sustained which have been instituted on the bill of the insolvent corporation itself or upon the bill of a simple judgment creditor. The operating consent receivership is the towering exception to the normal rule that apart from statute an unsecured creditor who has no judgment is not entitled to the appointment of a receiver. The consent receivership, which was regarded as revolutionary when first employed but now hardly excites comment, has been traced back to the Wabash receivership which arose in 1884. The consent receivership was finally directly sustained by the Supreme Court in 1908, when it passed upon the validity of the equity receivership of the New York City transit lines (*Re Metropolitan Railway Receivership*, 208 U.S. 90).

The historical origin of the institution of receivership has embarrassed its further development. Receivers are supposed to be "indifferent"; yet the practise of securing a "friendly receiver," an individual chosen by the corporation which flees to an equity court or bankruptcy court for protection against its creditors, has too often resulted in causing the receiver to be an individual who is expected to carry out the wishes of a dominant group of stockholders or creditors, as the case may be. Since the appointment of receivers is one of the important bits of patronage which a court can dispense, not infrequently a co-receiver is appointed, sometimes a friend of the judge or a political ally.

A receiver succeeds to all of the rights of the corporation or estate for which he is appointed; his first task is to ascertain claims against the property; he may pay certain claims as preferred under highly technical rules; he may be called upon to segregate the income, in case any part of the property is mortgaged, so as to assure to the mortgagee the income arising from the mortgaged property; he may bring suits for mismanagement against previous officers; and while he is in possession, as a general rule, no claims may be brought against the property except through him, and they may not be enforced except by a specific order of the court. Contempt procedure is available for the protection of the property in the hands of a receiver. Before the labor injunction was fully developed it was invoked in two instances to curb strikes against railroads in receivership.

The primary duty of the receiver is of course to manage the property and safeguard the funds. The management of the property can be and often is manipulated in such a direction as to give emphasis to the claims of one or another group of contending creditors or stockholders seeking ultimate domination of the properties. Particularly where a railroad goes into receivership and the friendly receiver is the former president of the railroad, there is a tendency for him so to handle affairs as to safeguard the stockholding interests as against the creditors; although of course any combination is possible. Courts in such cases have taken the position that they were neutral adjudicators in the ensuing struggle to determine which class of claimants should come out best on reorganization; and receivers in theory take the same attitude. In practise some judges have insisted that the receiver should take a real

part in making sure that the reorganization plan is fair and that the properties are maintained in a state permitting a fair reorganization; but this view is still regarded as progressive and has not been accepted by many courts.

Where, as is usually the case with railroads and frequently so with large corporations, the enterprise cannot be sold or liquidated or, if liquidated, shrinks enormously in value, the property virtually must stay in receivership until a plan of reorganization has been worked out. Reorganization involves scaling down the debts, perhaps wiping out the junior interests, putting the enterprise in condition to command additional working capital and then turning it back to some or all of its former owners and creditors. This is effected by the receiver through a foreclosure sale to the creditors or mortgage bondholders, who in turn resell the property to a new corporation, taking in payment securities of that corporation and distributing them according to the prearranged plan of reorganization. In this case the process of receivership may last for a long time.

Because of this, where the enterprise is vital to the public, as in the case of a railroad, the receiver has certain unusual powers. He may, for instance, issue, with the approval of the court, "receiver certificates" in return for borrowings, which are first liens on the property even ahead of mortgage obligations; but in theory these are limited to cases where, without such borrowings, the public interest would suffer. In any case he has the right to hire counsel and, with the approval of the court, to hire and discharge employees necessary for the safeguarding of the property and the carrying on of the enterprise.

Receiverships have been attacked as being unduly costly. Unquestionably there has been a legitimate basis for complaint in this regard, particularly where the receiver is either an operating man attached to the property, giving his primary loyalty to some group within the embarrassed concern, or where he is purely a patronage employee, who merely collects his fees and relies on the former operating staff to run the concern. There have been, however, instances of conspicuously able receivers; and the complaint of undue expense is perhaps more properly leveled at the attorneys in the case, who quite frequently assent to very large claims for fees on the part of receivers and their attorneys, feeling that thereby the receiver will make no

objection to their own claims for fees. In this respect receiverships do not differ from other cases in which claims are assessed against property and there is no one present effectively to assert the desire for economy—a situation like that which exists when a trust estate or an estate under a will is finally settled.

A factor which has added materially to the cost and cumbersomeness of reorganization under receivership procedure is the necessity of appointing ancillary receivers when the receivership property lies in several jurisdictions. Even a federal receiver may ordinarily sue only in the district where he has been appointed. The rule was laid down in an early case [Booth v. Clark, 58 U.S. 322 (1854)]. In the case of railroad receiverships its effects have been mitigated by a provision of the federal judicial code which provides that where land or other property of a fixed character extends as a unit into different districts within the same state or different states within the same federal circuit, the jurisdiction of the federal court shall be extended accordingly. A plan has been sponsored to expand the principle so as to make it apply to the whole country and to all types of receivership.

Another factor in the cost of receivership which has been the subject of much comment is the necessity for the foreclosure sale as a step in reorganization. The foreclosure is usually initiated by the trustee for the mortgage bondholder, whereupon the receiver offers the property for sale. But in fact the sale is a mere form of reorganization, for there are normally no purchasers for the properties of an insolvent railroad or large industrial corporation except the old security holders. Cash is necessary only for the purpose of paying off security holders who do not assent to the plan of reorganization and for the expenses of administration. The expense of foreclosure would be less of a consideration if thereby the court could finally dispose of the equities. But dissenting minority interests remain the bane of any reorganization; the court's normal means of curbing them is to fix a low upset price, i.e. the minimum price at which it will confirm a sale. A low upset price naturally operates to force a recalcitrant minority into line. Despite the decree of sale, however, reorganizations are not even free from the danger of subsequent attack, for in the much discussed Boyd Case a simple contract creditor was able to prevail on equitable grounds against a reorganization of many years

standing [*Northern Pacific Ry. v. Boyd*, 228 U.S. 482 (1913)].

There are available some instructive figures as to both the duration and cost of railroad receiverships. The more than 600 receiverships between 1870 and 1894 lasted between two and three years. But the 222 receiverships between 1894 and 1931 of roads operating more than 100 miles approximated an average duration of three and one half, and those of roads operating more than 1000 miles had a duration in excess of four years. There are now pending about 50 receiverships (over 30 were begun after the close of 1929), and these have been pending for an average period of approximately five years. The duration of receiverships has thus been steadily increasing.

The cost of these railroad receiverships is very great. The expense of reorganization of the Wabash (1911-16) is reported as \$3,449,500; that of the Pere Marquette (1912-17) as \$2,679,000; that of the Western Pacific (1915-16) as \$2,000,000. A record cost was reached in the reorganization of the Chicago, Milwaukee and St. Paul, the expense of which was over \$5,000,000. In this case the attempt of the Interstate Commerce Commission to control reorganization expenses was invalidated by the United States Supreme Court [*United States v. Chicago, Milwaukee, St. Paul and Pacific Railroad Co.*, 282 U.S. 311 (1931)]. In the Transportation Act of 1920 the commission had been given a share of power in railroad reorganization by a provision requiring its approval of the issue of railroad securities. It is not absolutely clear from the Supreme Court's opinion whether it held merely that the commission had acted *ultra vires* or more seriously that Congress could not confer upon the commission the authority to fix reorganization expenses.

Some of those who urge the reform of existing receivership procedure look to English example. In England the extension of managing receiverships of corporate enterprises has been slow. A distinction between a receiver and a manager is still maintained and the courts have shown themselves loath to embark upon managerial functions. The general rule is that a manager may not be appointed in the case of "statutory" undertakings. It took a special statute to enable the courts to appoint a manager for a railroad (Railway Companies Act, 1867, sect. 4, made perpetual by the act 38 & 39 Vict. c. 31), and the suit can be brought only by a judgment creditor. Although it is now settled

that a manager will be appointed over the undertaking of an ordinary limited company on the application of mortgagees or debenture holders whose securities include the goodwill, the development is comparatively recent, for the power was denied in *Makins v. Percy Ibotson & Sons*, [1 Ch. 133 (1891)]. Moreover the manager may be appointed for a brief period only, and a special application must be made to the court if it is necessary to continue the appointment. Where the liquidation of a limited company is desired a special "winding up" procedure exists. Where a company is only temporarily in straits there is available under a so-called Arrangements Act a reorganization procedure which enables the court without any necessity for a judicial sale to approve a plan of reorganization to which the consent of a three-fourths majority in amount of the various classes of creditors has been obtained.

A similar plan of reorganization by decree upon the agreement of a stated majority of classes in interest has been urged for adoption in the United States. There are indeed some who urge that courts of equity already have the power despite American constitutional limitations to effect such reorganization, and a few courts have actually ventured to dispense with the meaningless formality of sale. The most notable case is *Phipps v. Chicago, R. I. & P. Ry. Co.* [284 Fed. 945 (1922)], a decision of the Circuit Court of Appeals for the Eighth Circuit, which, however, the Supreme Court was prevented from reviewing.

A new era in railroad reorganization may date from the amendment of the Bankruptcy Act of March 3, 1933, which for the first time has made a bankruptcy procedure available to railroads. The act seeks to eliminate most of the evils of the equity receivership. It dispenses with ancillary receiverships and judicial sales and provides that a plan of reorganization when confirmed shall bind all security holders of each class of which two thirds in amount shall have accepted its terms. The scrutiny of the reorganization plan is entrusted to the federal district judge before whom the proceedings have been commenced and to the Interstate Commerce Commission. The act thus contemplates the collaboration of court and commission, but the plan must in the first instance be formulated and approved by the commission. The new procedure has been criticized on several grounds: for the duplication of function on the part of court and commission; for the extremely liberal

right to be heard which it gives to dissenting interests; for the retention of the upset price device when the majority agreement required by the act cannot be achieved; and for its inconclusive provision with respect to the fixing of reorganization expenses by the commission. Experience with the act has of course been too brief to permit a judgment of its operation.

Certain modern commentators had long insisted that the institution of receivership was outgrown. They favored a government bureau acting as liquidator or operator as the case might be. In the case of railroad reorganization the administrative ideal has only been partly realized. In the case of other enterprises the problem still remains unsolved. The choice of an efficient legal technique is important, but it must not be forgotten that the problem is conditioned also by the nature of American economic organization.

RECEPTION. When the term reception is used without further qualification, it usually refers to the reception of the Roman law in mediaeval Europe. The theoretical reception of the Roman law is sometimes distinguished from the practical reception. The former represents its intellectual assimilation, while the latter implies its actual application in legal practise. Again the particular is sometimes also differentiated from the general reception of the Roman law. The former refers to the infiltration of specific rules of Roman law, while the latter designates its adoption as a whole as the basis of the jurisprudence of a particular country.

The gradual assimilation of Roman legal ideas by the Germanic peoples who came into contact with the superior Roman civilization is readily understandable and is already evidenced in the

various *leges barbarorum*. The revival of the scientific study of the Roman law did not come until the time of the Italian glossators, who flourished in the twelfth century. But it is not necessary to accept the so-called continuity theory of Stintzing and Fitting that a direct line of legal scholarship may be traced from Justinian to Imerius in order to understand the survival of the Roman law, which like Roman civilization as a whole never "collapsed" entirely. A debased Roman law continued to be applied in practise in Italy, even if it was not the subject of learned development and treatment, although schools of both Lombard and Roman law seem to have existed before the school of Bologna. The Roman law was known first in the form of the Theodosian code, and then in the form of the codification of Justinian.

In other countries the persistence of the Roman law was aided by many factors: the political ascendancy of Rome; the inherent excellence of the Roman law; its role in the formation of the canon law; its Latinity, which made it the natural preference of the learned; and, finally, the regime of the personality of laws, which everywhere entitled Latins to be judged by their own law. The absence of strong national feeling facilitated the acceptance of the claim of the Roman law to authority. In the Middle Ages the Roman law was even regarded as *ratio scripta*, or written reason. With the revival of learning its influence was greatly extended.

Thus it is not surprising that the reception of what was more or less Roman law should have taken place almost throughout western Europe. The Scandinavian countries alone remained relatively immune. Even in northern France, the region of unwritten law, the supposedly Germanic *coutumes* were greatly adulterated with Roman law. Not even England escaped its influence. As Zuhlieta has put it, England really had a glossator in Vacarius and a post-glossator in Bracton. Maitland in his celebrated essay *English Law and the Renaissance* suggested that English law in the sixteenth century was in danger of being displaced by Roman law. In any event England like France received Roman law in homeopathic doses, which made possible its assimilation as an organic part of the native legal system.

A general reception of the Roman law, however, took place in only a few countries, notably Italy and Germany. The Roman law was received in Germany *in complexu* as late as the fifteenth century. Probably because of this fact

and the degree of completeness of the break with previous development represented by the reception, the phenomenon has been the subject of almost endless speculation and controversy and has become virtually a test of party regularity. Romanists have tended to accept the reception as a matter of course, while Germanists have tended to regard it as nothing short of a miracle. It is almost forgotten that the law books of Justinian were received only as they had been reworked by the Bartolists, who had already adapted them to the needs of mediaeval Italy. Indeed the rule was *quod n. m. agnoscit glossa non agnoscit foram*. The Roman law moreover was received, at least at first, only as a general subsidiary, or common, law. Where statutes were passed in derogation of it or where contrary customs could be proved, they prevailed.

Economic, political and religious causes for the reception of the Roman law in Germany have been listed by many historians. According to the economic argument, with the growth of commerce and the development of a money economy a more highly developed legal system such as the Roman law became imperative. This theory involves two difficulties. In the first place, it is based upon the assumption that the native law was inadequate to meet the new needs of the German towns. In the second place, it is not in accordance with the facts, for it was in the towns that there was least dissatisfaction with the native law. The law of the important commercial city of Lübeck, for instance, remained comparatively unromanized. Moreover the heyday of the German commercial cities preceded the reception. Politically the reception is supposed to have been facilitated by the absolutistic claims of the princes. The Digest contained such bits of precious doctrine as *princeps legibus solutus* and *quod principi placuit, legis habet vigorem*, which seem to have been of obvious serviceability in strengthening the hands of the princes. But there is no particular evidence that the jurists were pressed into service for this purpose, and German absolutism at any rate did not flower until well toward the seventeenth century. The scraps from the Digest were no doubt valuable as window dressing, but they had to become known before they could be invoked. As for the Reformation itself, it had no immediate connection with the reception. In the triad of Renaissance, Reformation, Reception the last came earliest. The law against the church had already developed in the era of the hegemony of the church. At any rate the jurists, who by the

fifteenth century were almost always *doctores utriusque juris*, doctors of canon as well as of civil law, took sides and could quote the Scriptures as well as the pagan Digest for their purposes. The same had been true earlier in Italy, where jurists could be found in the camps of both the Guelphs and the Ghibellines.

According to the most orthodox theory, the decisive cause of the reception lay neither in these external causes nor in the inner condition of the Germanic law but in the prevailing political system. The absence of a strong central power made it impossible to establish a strong central court to administer a unified legal system or a legislative organ to help in its creation. The disunity in German law in turn discouraged its scientific cultivation. Those Germans in the fifteenth century who wished to study jurisprudence had to turn to the Italian schools, and there the study of jurisprudence meant the study of the Roman law. The acceptance of the Roman law was made to seem natural by the so-called theory of continuous empire. It was generally held indeed in the mediaeval world that all political theory emanated from the old Roman Empire. The Carolingians after their conquest of the Lombards had regarded themselves as Roman emperors, and later the title became attached to the German crown. When an imperial court, the Reichskammergericht, was established in 1495, it was commanded to determine causes according to the common law of the empire, which meant the *Corpus juris civilis*. The reception was completed in the local codes of the fifteenth and the sixteenth century, in which the doctors of the civil law took an active part.

This view of the reception is borne out by English legal history. It was the existence of the King's Court in England that created a national common law and a national jurisprudence, which flourished in the Inns of Court. To a lesser degree this was true in France with its *parlements* and in Germany itself, in Saxony, where the native law had found literary statement in the celebrated *Sachsenspiegel*. Yet it is difficult to escape the impression that the historians are attempting to make a process appear inevitable which to some extent at least involved elements of accident, will and choice.

There has been a tendency in Germany to regard the reception as catastrophic. No doubt Germanic legal ideas were submerged and the Roman ideas which replaced them were often imperfectly absorbed and improperly under-

stood. But the importance of the *Volksgesetz* in shaping a nation's law has been exaggerated. The peasants who said *Die Juristen sind löse Christen* had in mind the *doctores utriusque juris*, but the reason for this dislike could hardly have been that the latter were familiar with Roman law. Popular suspicion of jurists of all persuasions has been all but universal. It was a widespread belief some decades ago that the reception was one of the important causes of the Peasants' War, but more recent historians have exploded the legend. There is no good evidence that the jurists of the period of the reception did not distinguish the peasants' tenurial rights from the more absolute forms of ownership of the Roman law; but even if this had been true, the Roman law would have been no more than an excuse for dispossessing them. As a matter of fact the discontent of the peasants was due to unfavorable economic conditions; for instance, the fall of agricultural prices.

Next to the German the most celebrated general reception in the history of western law is the reception of the English common law in the United States. Here there were after the revolution both legislative organs and general courts, even if at first there was an almost negligible number of law schools. Yet common law was received despite the fact that there had been during the revolutionary period a general suspicion of English law and the lawyers. French influence after the revolution was so considerable that it has even been pretended that if books of the civil law had been available in adequate translation the Roman law would have had another wonderful conquest. But the issue was never really in doubt. English law was a part of English culture which the colonists could not do without even after the hegemony of the mother country was ended. Emotionally at least there was "a continuance empire." The late colonists drew upon English law as needed, adapting it to American conditions. Mechanically the most important factor in the reception was the fact that the books of the common law were written in the English language. Yet even so it was not always understood. It need merely be recalled how Coke's doctrine of the supremacy of law became American constitutionalism. Moreover as a result of the leaning upon English precedent native reforms were often delayed, and when secured were sometimes perverted. There was indeed nothing wrong in the looking to English example. But in this form of comparative law there was only one standard of comparison.

The general study of the role of the process of reception in the development of legal systems has yet to be pursued. The concept of reception has been applied increasingly to other bodies of law than the Roman. Thus there has been traced the influence of cuneiform law upon the law of the Bible. The Roman law itself probably borrowed from more ancient systems. There is a legend of an embassy to Greece in connection with the compilation of the Twelve Tables. Mitteis has shown that the Roman Empire had to recognize the popular local law of the east, which in the post-classical period not only borrowed from the Roman law but before long repaid the debt. While Riccobono accounts for the changes represented by Justinian law by a process of internal development, Collinet argues that they had a Hellenistic origin. In the mediaeval period German town laws as well as the laws of the Italian cities were copied by the Slavs, who also borrowed extensively from the canon of the Eastern church. In modern times there has been in many civil law countries an almost literal reception, first of the French and then of the German civil codes, and institutions of the common law have influenced the public law of many western countries. Such a common law institution as the jury has become virtually a world institution. Outside the orbit of western law there was a reception of ancient Chinese law in old Japan, and now both of these oriental countries have borrowed from the French and German civil codes.

The controversies over legal reception are strongly reminiscent of the diffusionist controversy in anthropology. In the spread of legal as of other ideas there must be considered the possibility not only of diffusion but of parallel development. But the problem should not be posed in the alternative. As always in the development of a culture both diffusion and parallel development must be taken into account. Given contact in a historical period, diffusion cannot be doubted, particularly since law in mature civilizations is the product of scientific cultivation.

In the encounter of two bodies of law the more highly developed has the better chance of victory. It has an immediate advantage in the superior excellence of its rules. Thus it has been said of the Roman law that it prevailed *non ratione imperii sed imperio rationis*. The scientific cultivation of a body of law is perhaps an even greater advantage in the struggle for survival. "Taught law," as has aptly been said of the

common law, "is tough law." Perhaps a third and most important factor is the tie of political allegiance. It is not necessary to accept the view of the analytical school that law is only the creature of the state to concede the ultimate connection between the fortunes of a legal system and state power. The political might of Rome and England supplied the prestige which made all but inevitable the great careers of their legal systems.

Apparently the type of law most suitable for reception is in the field of private law. The highly developed Roman law of obligations almost completely displaced that of the Germanic law. The reception of criminal law seems to be much less intensive. The Roman criminal law was in large part quickly set aside by imperial legislation, and in the United States common law crimes were at once abolished. Here political factors are too pressing and powerful. Specific institutions of public law are even less likely to be received. It is political theory rather than public law that makes headway.

It seems remarkable at first sight that even private law institutions should be so adaptable. The pagan Digest apparently suited Christian Europe well enough, and the monarchic common law received a welcome in democratic America. Perhaps part of the answer is that Europe really never was Christianized—it has been said that the first and last Christian died on the Cross—and that the effects of the democratic revolution in the United States were moderated by the fathers of the constitution. But part of the answer is also that the sociological basis of private law has been exaggerated. The primary function of a system of private law is to provide fundamental forms for business enterprise, and its excellence lies after all in the state of its technical development.

Above all the reception of legal ideas has been aided by the tendency of certain systems or branches of law to develop upon an international basis. The strength of the Roman law lay precisely in the fact that it had absorbed so many elements of the laws of other peoples that it was particularly suited to become a world law. In mediaeval Europe the feudal law was a common law and the canon law was a universal law. Always maritime and commercial law have passed across national frontiers. Today an international assimilation of private law is being actively promoted by a science—comparative law. As a result of this and as an outcome of the process of fusion which has been proceeding for

centuries a system of western law may be said to have arisen.

RECIDIVISM. The problem of recidivism, or relapse into crime, looms very large in modern penology. In the United States from 1926 to 1930 recidivism of male prisoners in state and federal prisons and reformatories increased from 45.1 percent to 55.5 percent and of female prisoners from 31.8 percent to 32.7 percent. In England in 1931 the percentage of recidivism was 69 for males and 72 for females. In Germany in 1927, 1929 and 1930 the percentages for both

males and females were 29.2, 35.55 and 38.23 respectively. In France in 1926, 35.7 percent of convicted criminals were recidivists. In Italy in the same year the percentage was 72. In the Soviet Union in 1930 it was 61. In Norway and Denmark it was 47 in 1928 and in Sweden in the same year 38.6.

Thus a large proportion of the inmates of penal institutions in most countries are "repeaters," persons who have been committed to a penal institution after having served one or more terms. While available data do not warrant very definite conclusions, it appears that larceny and the related offenses, burglary and robbery, in the order named, are the most frequent recidivistic crimes. Women on the whole are much less recidivistic than men.

For the entire United States the largest male group of recidivists in 1929-30 ranged from 18 to 24 years of age and the next largest group from 25 to 34. In New York state in 1931 the median age group for adult recidivists was 25 (27 for first offenders) and for youthful recidivists 19 years (20 for first offenders). Of the youths sentenced to imprisonment in England in 1931 those 19 and 20 years old had the greatest number of previous convictions. In Germany the largest recidivistic group falls between 30 and 40, the second largest between 25 and 30 and the third largest between 21 and 25 years of age.

The American reformatories, which were originally established to provide special facilities for reforming youthful first offenders, evidently fail of their purpose. In 1929 and 1930 only 14.9 percent of the males committed to reformatories in the United States were reported as having no previous known sentence to any penal institution. In 1931 in the New York State Reformatory in Elmira, to which may be sent any youth between the ages of 16 and 25 who "has not theretofore been convicted of a crime punishable by imprisonment in a state prison," 78.6 percent of the inmates had previous criminal records.

Moreover the statistics are probably an understatement of the extent of recidivism. There are a considerable number of prisoners concerning whom no definite report as to previous commitments can be obtained. Payment of fine, suspended sentence or probation for a previous conviction imposed in place of an institutional sentence may not be entered on the record of prior commitments. Furthermore, at least in the United States, where central identification

bureaus have been established only recently, the information, furnished by the inmates, is probably not altogether reliable. Again, many crimes are not reported, or if reported the offenders are not apprehended.

There are also many factors which limit the comparative value of statistics on recidivism. Among the most important are differences in the criminal law as well as in the procedural codes of the various countries. Thus, for example, liquor law violations in the United States and drunkenness in England account for much recidivism. Again, one country may make extensive use of probation while another may impose fines in most cases. In 1930, for example, two out of every three convictions in Germany's criminal courts were disposed of by money fines. In one country fines may be paid in instalments, in other countries commitment to a penal institution follows the non-payment of a fine. In countries where probation or fines or other non-institutional types of sentence are employed recidivism, which is always based upon commitments to penal institutions, would appear to be less prevalent than in countries where the first offense resulted in imprisonment. Moreover in the absence of knowledge of the difference in the ratios of crimes committed to crimes reported and to criminals apprehended and convicted, the significance of recidivism remains unknown.

Since Lombroso's inauguration of the study of criminal anthropology some progress has been made in the identification of recidivistic types. The work of the "crimino-biological" laboratories in Italy, Austria, Germany, Belgium, Portugal, Spain and the Soviet Union has been of particular importance in this connection. The conclusions of Kretschmer, who maintains that body build is correlated with psychic dispositions and psychoneuroses, although based upon his study of insane Swabian peasants, have been applied to recidivists. The Deutsche Forschungsanstalt für Psychiatrie, which, among other projects, is engaged under the direction of Rudin and Viernstein in a most extensive inquiry into the relations between psychiatry and criminology, has made an attempt by means of the Kraepelincan system to ascertain the degree of inheritance of psychic anomalies in the families of recidivists in order to determine which criminals should be permanently segregated and which could be rehabilitated.

While on the continent the tendency to seek for the roots of recidivism in hereditary "traits"

is becoming pronounced, in the United States under the influence of "functional" psychology environmental rather than hereditary factors are increasingly stressed in the attempt to account for careers of crime. The work of the various European investigators may be criticized on the ground that the possible effects of sociological factors on the lives of the criminals studied have not been adequately eliminated. Furthermore the initial assumptions used in the investigations, namely, the Kraepelincan schematizations or the Kretschmer body types, may be invalid.

Unfortunately little is known about general crime causation and less about the causes of recidivism. While the latter are to be sought for in the causative factors making for crime generally, there may be special factors which enter into recidivistic careers.

Conceivably the administration of penal institutions and the type of offender in the institution play their part in confirming criminal habits. In New York state during 1931 of 3415 men sentenced to correctional institutions 2703, or 80 percent, had known criminal records. These 2703 men had been arrested at least 10,766 times, an average of over 3 previous arrests for each man. In 1929, 79.7 percent of the population of the Massachusetts State Prison at Charlestown were recidivists. Approximately one fifth of the prison population had between 5 and 9 convictions. Of the 2703 individuals 1780 had been previously confined in institutions. Just what effect these inmates had on the other 20 percent and upon one another is not known. The large percentage of adult state prisons which possess records of each inmate's commitments in juvenile correctional institutions reveals that the institutional treatment did not check careers of crime and may have been one of the factors in their continuation.

Inefficiency or corruption in the administration of criminal law may encourage further criminal acts. The lack of integrated aftercare to adjust the discharged prisoner to society upon his release, especially in times of widespread unemployment, undoubtedly contributes to the persistence of property offenses.

While there is no unanimity on the classification of criminal types, students agree upon three general classes of recidivists. There are, first, the pathological cases, the definitely insane and mentally defective; second, the "habitual criminals," the mentally weaker and suggestible, emotionally unstable characters who drift into crime because they are unable to cope with the

difficulties of life; and, third, the "professional" group, the relatively strong characters who deliberately choose a life of crime. Among these groups of recidivists a great number, perhaps the majority, specialize (special recidivism) in a particular offense, such as smuggling, burglary, larceny, arson, robbery, counterfeiting or forgery. On the other hand, many recidivists turn from one type of offense to another (general recidivism).

In the application of the criminal law recidivism has long been recognized as an aggravating circumstance. In the Roman law and in the mediæval German law a second offense led to an increase of the penalty in the case of certain enumerated offenses, especially theft. The Italian criminalists recognized recidivism (*consuetudo delinquendi*, *iteratio delicti*) as a general aggravating circumstance; this doctrine was applied subject to exceptions in the German common law and under most of the German codes of the nineteenth century.

During the Middle Ages a second offense was often ground for extreme punishment, even if the crime itself was not serious. In England a statute enacted in 1535 in the reign of Henry VIII (27 Henry VIII, c. 25) provided that for a second offense of vagabondage "the upper part of the gristle of his right ear" should be lopped off, and for a third offense hanging was inflicted. Recidivism, however, could have only a limited application when most offenses were visited with capital punishment.

The *Code Napoléon* sanctioned capital punishment in the case of recidivists who had committed a crime punishable by penal servitude for life. In 1854 France enacted a law whereby criminals sentenced to penal servitude for terms of eight years and more were, upon expiration of their term, forced to reside for life in the colony of New Caledonia. In 1885 another law decreed internment for life in a colonial possession even in the case of the less serious offenses whenever the number of previous convictions exceeded a fixed minimum varying with the type of offense. In France between 1886 and 1900 no fewer than 15,837 habitual criminals were banished for life.

The present German imperial code, despite the predominant tendency of the earlier regional codes, recognizes recidivism as a ground for increased severity only for such crimes as theft, robbery, receiving stolen goods and fraud. Moreover a statute of limitations runs against cognizance of the repetition of the offense. The Italian Penal Code of 1889 increased the severity

of sentence only in cases of special recidivism, this is no longer true under the new code of 1931, but the punishment is still severer in the case of special recidivism. England's Habitual Criminals Act of 1869 (32 & 33 Vict., c. 99) and Prevention of Crime Act of 1871 (34 & 35 Vict., c. 112) gave the police more extended powers of supervision over discharged prisoners. The present English Prevention of Crime Act, 1908 (8 Edw. VII, c. 50), gives the courts power to impose a sentence of preventive detention of from five to ten years, in addition to the ordinary penalty, whenever it is shown that the defendant has been convicted and sentenced to penal servitude three times since the age of 16.

An almost unparalleled degree of severity has been adopted toward recidivists in the United States in recent years. Some states had long had statutes applicable to habitual criminals. The Baumes law of New York state, enacted in 1926, was distinguished, however, by its mechanical cruelty. An earlier New York statute of 1907 had given power to the courts to sentence to life imprisonment any person convicted of 4 felonies. The Baumes law now made the sentence mandatory; the courts were given absolutely no discretion. In the case of a second offense of felony, aimed especially at burglary and robbery in the first degrees, it was also made mandatory for the court to impose not less than the longest term prescribed upon a first conviction. In 1932 as a result of widespread protest against the hardships of the law the mandatory provisions were revoked. The example of the Baumes law has been followed with variations in Oregon, California, New Jersey, North and South Dakota, Kansas and Vermont.

Since the middle of the nineteenth century recidivism has increased in almost all countries. Although its extent has generally been regarded as a measure of the failure of penological methods and viewed with growing alarm, there have been a few optimists who have taken it as an indication of an ingrown criminality in a steadily narrowing criminal class. Thus Garofalo, one of the leading positivists, remarks that it is precisely in the most civilized countries that the largest amount of recidivism exists.

The classical penologists who have applied their premises to the full logical extent have been forced into a position which makes it impossible for them to consent to really effective measures for dealing with recidivists. To be sure, the classical penologist believes that the gravity of an offense should be met by a pro-

portionate severity of punishment, but this severity must necessarily be confined to the individual offense. Once the penalty has been paid the offense has been discharged and must not be reckoned against the offender. Moral responsibility cannot be applied upon a cumulative basis. The positivists, on the other hand, who have achieved a reputation for leniency by virtue of their recommendation of the individualization of punishment, show themselves to be much more realistic in their attitude toward repeated offenders. Regarding punishment merely as a matter of social defense, they can logically urge the greatest severity toward repeaters. Since the criterion which determines the application of measures of social defense is no longer the kind of crime committed but the type of social menace manifested, the professional, habitual and pathological types of recidivists are dealt with as especially dangerous.

As the review of the provisions of the criminal codes has already made apparent, the measure of social defense which has received primary support in legislation is the term of preventive detention. The discharge of the recidivist from the institution of prevention should depend upon whether social dangerousness has ceased to exist. Penal transportation is still practised in France, although opinion against it is crystallizing. On the continent there has been much discussion concerning the sterilization of recidivists, but little advance in this direction has been made. Compulsory sterilization for recidivistic sexual offenders has been introduced in Germany. In the United States California has enacted a series of sterilization laws since 1909, which provide for compulsory sterilization of certain types of recidivists and moral degenerates; but only seven vasectomies have been performed in the California state prisons. Similar laws have been enacted in many other states, but most of them have been held unconstitutional. Recently, however, the United States Supreme Court has declared such laws constitutional. Without a knowledge of the factors causing recidivism, treatment of prisoners, even when directed toward their rehabilitation, must remain a matter of trial and error.

RECIPROCITY See COMMERCIAL TREATIES.

RECLAMATION. In nearly every country of the globe reclamation of land has been a major factor in the advance of civilization. Although widely divergent in processes, standards and results it has everywhere had in view increase in land resources and therefore enlargement of the opportunities for the people to gain a livelihood from the soil. In every country it has

been recognized as promoting the state or national welfare.

Perhaps the best technical definition of reclamation is that it consists of "the operations and process of bringing to a high grade of usefulness in crop production lands which at the inception of the undertaking are either in an unproductive state or are of inferior or limited capacity to produce." Projected to its full meaning this definition would include establishment on the land of "a full complement of adequate farm homes and well-planned farmsteads, with the ownership on a secure financial and economic basis." This represents the most advanced aim of reclamation in the modern world and in some countries is being carried through, from construction of the necessary works to organized development or settlement of the land, by the agency undertaking the reclamation. In New South Wales, Australia, for example, the Murrumbidgee irrigation project included not only a storage dam, a movable diversion weir, a main canal, branch canals, subsidiary distributing channels, bridges, checks, regulators and the like but also the laying out of towns and villages and a complete system of roadways. In addition, provision was made for a general surface drainage system.

More generally, however, reclamation is considered as comprehending only the actual land improvement or the construction of the physical works required to make the land productive. In such cases the various subsequent steps in the process, such as obtaining, financing and advising settlers and developing cropping programs, may be unrelatedly carried out and motivated by perhaps different purposes. The benefits of reclamation may be state or country wide or merely local or individual.

Reclamation may involve merely the improvement of lands requiring some degree of melioration to make them fully useful. The lands may be too wet for satisfactory cultivation and therefore, prior to reclamation, of marginal or sub-marginal utility or even entirely waste. In such cases the chief need is for drainage. Large areas in humid countries have been subjected to this type of reclamation, notably in England, Germany, France and Italy; similar projects have been carried out in the upper Mississippi valley and the Great Lakes regions of the United States. Another category would cover reclamation of swamps, which before improvement have practically no human value. Examples can be found throughout the world. Still another category is

made up of the clearing of cut over lands, as in portions of the south, the northern lake states and the Pacific northwest of the United States. Then there is reclamation by drainage, washing and soil correction, singly or in combination, of the vast alkali areas distributed throughout the arid and semi-arid portions of the earth. Finally, one of the most impressive kinds of reclamation involving unwatering is the recovery on an extensive scale of lands from the sea, as in the fens of eastern England and the Zuider Zee of Holland.

While available data do not warrant an approximation of the world area in the above categories already reclaimed, they indicate that it is very large; in the United States over 70,000,000 acres have been reclaimed by drainage alone. Furthermore there are still extensive areas which require reclamation by some form of unwatering, and the economic and social effect of making these lands valuable for agriculture would be far reaching. It is, however, in irrigation, which now extends to some 200,000,000 acres throughout the world, that reclamation as an economic and social institution is most fully exemplified. This is largely because of the wider and more complex human relationships involved in irrigation and because the problems connected with the ownership, distribution and use of water far transcend those concerned with the construction of physical works. For any specific reclamation by irrigation rights to water must be acquired and defended in the courts where public administration fails to provide security; rules and regulations insuring equitable apportionment and prompt delivery of the water must be set up and enforced; there must be management capable of forestalling or adjusting differences with or between water users; there must be effective cooperation between landowners.

In the modern world, as was the case in earlier times, governments are concerned with reclamation on an extensive scale. Financial aid ranges from bearing the entire cost of comprehensive works of reclamation to subsidizing individuals by meeting part of the cost of land improvement. Government participation in reclamation is not confined, however, to direct financial aid. Even where governments do not extend such assistance they are concerned with investigating opportunities for and the best means of carrying out reclamation, with the framing and administration of reclamation laws, with land settlement projects, with the types and practises of agriculture to be adopted and

finally with the social and cultural factors of reclamation. Principles of ownership of water have to be established and laws enacted which carry these principles into effect. No more difficult legislative and judicial problems have confronted the governments and legal tribunals of the world than the framing and interpretation of laws to govern the acquisition and administration of water rights—state, interstate and international. In countries of recurring droughts and famines and teeming populations, such as India and China, no graver responsibility has been forced upon those charged with state affairs than the creation of opportunities for living through reclamation of waste lands and increasing the available water supply for irrigation. In such cases the measure of government aid required is the number of persons dependent upon the products of the reclaimed land.

More generally, however, the reclamation problems of governments relate to the normal development of resources. The impelling motive is thus more likely to be one of the following: building up of the national position in the matter of agricultural production; provision of land for an increasing population; assistance to private landowners or cultivators to carry out needed improvements; breaking up of large landed estates in the interest of closer settlement; strengthening and sometimes rehabilitation of community reclamation enterprises; opening up of unused public lands for settlement; pushing out of the frontier, particularly in newer countries. Claims in justification of government aid are sometimes based on the principle that part of the wealth resulting from exploitation of the nation's natural resources lying in areas susceptible of reclamation should in all justice be devoted to the material upbuilding of those areas.

In the United States the Bureau of Reclamation of the Department of the Interior builds and in some cases operates federal reclamation projects in the seventeen western states, the entire cost being repayable by the water users, without interest, now usually within forty years. Generally only the larger and costlier projects which cannot be financed except through government aid are undertaken by public authority. From the passage of the Reclamation Act of 1902 to the end of the fiscal year 1930-31 the Bureau of Reclamation has spent for surveys, construction, operation and maintenance \$263,740,000 in the development of thirty-four projects. In 1930 the area irrigated with water from

government works was 2,790,856 acres. The greatest of these schemes is the Boulder Canyon project on the Colorado River, begun in 1930 and to be built at a cost of \$165,000,000. The waters of the reservoir will reach in excess of 1,000,000 acres of irrigable land.

In Canada dominion assistance covers only research, supervision and settlement. Through the National Commission of Irrigation the government of Mexico has built a number of irrigation projects and others are under consideration; payments for reclaimed land do not always entirely reimburse the government for its investment. In France government grants are made to farmers' societies and to commercial irrigation companies, generally up to one third of the cost and in some cases the government has guaranteed interest on the bonds of the commercial companies. Subsidies are also granted for drainage and protective works, and substantial sums are appropriated for research. In Italy the government either builds the more important reclamation works or guarantees the financing programs of associations or consortia of landowners. In order to stimulate activities of the latter type in 1928 a royal decree authorized the formation of the Association of Land Improvement and Irrigation Consortia and this body proceeded to make arrangements with the larger credit and thrift organizations for a credit of 5,000,000,000 lire. The sum was to be made available in ten equal annual instalments. In the past the Italian government has also made large expenditures in acquiring and extending irrigation projects initiated under private auspices, notably in the valley of the Po. In Egypt with a few exceptions all dams, barrages and main canals are built at government expense and are under government control. In India all important irrigation works are planned, constructed and maintained by the government and financed with provincial or imperial funds. The income goes entirely to the government and some of the works return a large profit. Works to protect districts from crop failure and famine are not intended to be financially remunerative, while loans are made to private landowners and cultivators for land improvements. In Australia the states in which irrigation is important devote much attention to construction of irrigation works and closer settlement. In Victoria and New South Wales, which have the largest irrigated areas, important works are built at state expense, the cost being repaid over long periods at low rates of interest. In several countries taxes are remitted on recla-

mation works or on land reclaimed by individuals. These examples of government aid, while by no means complete, illustrate the nature of the procedure.

Important as is the part of governments in reclamation, private commercial companies, communities operating through irrigation, drainage or reclamation districts and cooperative associations and individuals, all are concerned with it to a large extent. In the older countries the cooperative community associations are numerous and of long standing and many have been developed to a high degree of efficiency. In the United States the district form is most important. The district (partaking of the characteristics of a public or quasi-municipal corporation) nearly always has the authority to finance through bonds as well as the right to levy assessments or taxes. In the United States cooperative irrigation companies are usually those whose capital has been subscribed in cash or labor by the shareholders. The so-called mutual irrigation company generally originates as a subsidiary of a land development company and in time passes over to control of the land buyers. On some of the United States government reclamation projects water users' associations represent the landowners when dealing with the government and eventually take over maintenance and operation. Commercial irrigation companies furnishing water for irrigation were at one time an important factor in the United States but are decreasingly relied upon. An additional type of private irrigation enterprise in the United States is the Carey Act project, under which private capital constructs irrigation works on public lands ceded to the states by the federal government.

The accompanying table indicates the extent in acres of irrigated areas in the nineteen irrigation states of the United States (Arizona, Arkansas, California, Colorado, Idaho, Kansas, Louisiana, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Washington, Wyoming) served by the various types of agencies above mentioned.

Economic feasibility is one of the fundamental considerations in reclamation, especially as costs have mounted. While large numbers of projects have been highly or moderately successful, both financially and agriculturally, losses have been incurred in all types and in all countries. Delayed settlement of the reclaimed land has been the most frequent cause of difficulty in such countries as the United States, Australia and the Union of South Africa. Other causes of distress or loss include excessive costs, unsound financing, conflicts over water rights, engineering mistakes, poor soil or changing market conditions for the crops grown. Losses resulting in abandonment of works are rare.

In recent years in the United States, most notably in the great Boulder Canyon project, economic feasibility has been dependent frequently upon the supplemental income from hydroelectric power generated as a by-product. On the other hand, some reclamation projects from which the combined income from agriculture and hydroelectric power is not likely to be sufficient to return the capital investment are being seriously contemplated in the United States. This involves the question as to how much of their equitable share of the cost will be borne by the industries or non-agricultural interests which will be directly or indirectly benefited by the reclamation; or, as an alternative, if the works are to be built, whether increased government subsidies, which mean some redistribution of wealth, are to be provided. This is perhaps one of the most important of the social aspects of modern reclamation, especially in countries like the United States, where the desire for development rather than the land and food needs of the population is the main motive for reclamation.

Because of its effect in extending the usable land resources and as a result of its influence on the movement and distribution of populations, on the growth of industry and commerce in the arid and semi-arid regions, on the food supply and on the general material and human welfare of many countries reclamation will al-

ways stand out as a basic activity of the governments and peoples of the world, and the best statesmanship will always be demanded for the solution of its problems. As has been shown, these problems, especially in reclamation by irrigation, go far beyond the building of physical works. While individual work will continue in importance, it has been shown through centuries of experience in older countries as well as shorter experience in the Americas, Australia and the Union of South Africa that the great tasks of reclamation can be accomplished only through the cooperation of a large number of people, requiring in many instances substantial participation by governments. Reclamation then may be expected increasingly to take on the aspects of a national public question, especially when the chief argument advanced in its favor is not addition to the food supply but the encouragement of community building.

RECLUS, JACQUES ÉLISÉE (1830-1905), French geographer and anarchist. Originally trained for the Protestant ministry, Reclus soon turned to the study of geography and affiliated himself with the revolutionary movement. He was exiled after the coup d'état of 1851 but in 1857 returned to France, where he remained until he was again banished after the fall of the Paris Commune in 1871. He lived for many years in Switzerland, later in close association with Kropotkin. From 1894 to 1905 he served as professor of comparative geography at the Université Nouvelle in Brussels, where he established a geographical institute.

Reclus' geographical work, written in the tradition of Ritter and Humboldt, is centered in his comprehensive works *La terre* (2 vols., Paris 1867-69; tr. by B. B. Woodward, New York 1871), *Nouvelle géographie universelle* (19 vols., Paris 1876-94; tr. and ed. by E. Ravenstein and A. H. Keane, London 1878-94) and *L'homme et la terre* (6 vols., Paris 1905-08; new ed. by Paul Reclus, G. Goujon and others, 3 vols., 1931), which describe physical milieu and phenomena, the distribution of mankind and the history of human institutions and their interrelations. He worked with his brother Élie, who is best known for his *Les primitifs, études d'ethnologie comparée* (Paris 1885; English translation, London 1891).

As early as 1851 Reclus concluded that anarchy, or the absence of government, was *la plus haute expression de l'ordre*. His anarchistic views found their fullest expression in *L'évolution, la révolution et l'idéal anarchique* (Paris 1897). He believed that human progress develops higher forms of freedom and solidarity, voluntary cooperation and free or communist-anarchist types of distribution; to initiate the coming anarchy resolute and courageous elimination of such

obstacles as authority and obedience, monopoly and misery, is imperative. He was a militant member of Bakunin's secret international brotherhood and of other anarchist and republican groups, but was never a party man or a fanatic. A person of engaging charm and one who always preserved his own independence in the controversies of the diverse anarchist schools, Reclus exercised wide influence in anarchist circles throughout the world.

RECOGNITION, INTERNATIONAL. Recognition, "the assurance given to a new state that it will be permitted to hold its place or rank, in the character of an independent political organism, in the society of nations" (Moore, J. B., *Digest of International Law*, vol. i, p. 72), is a recent concept in international law. If the principles of independence and equality of states formed an early theoretical basis for the doctrine of recognition, the identification of sovereignty and personality prevented its appearance until a later date. From this identification arose the theory of legitimacy, which was principally responsible for the lack of a doctrine of recognition. This theory is seen first as one which upheld the hereditary right of a dynasty against any rival claimants. Transformed later into a theory which posited the better right of monarchic government as compared with other forms, it became eventually an assertion of the legitimacy of the existing government. It is in this latter sense that it appears "as a counter-theory to the doctrine of recognition." It was not until the concept of sovereignty was divorced from personality, until the idea of popular sovereignty had made some headway, that there was any need or justification for recognition. Today legitimacy has been reincarnated in the form of the better legal right of the existing government and stands in conflict with defactoism, which insists that a break in the legal order may be healed by "the normative power of facts and the transference into political reality of abstract legal principles." But in both cases there is a necessary emphasis upon the

de facto existence of the government, the legitimist contending that an immutable legal character has been bestowed upon the de facto regime and the defactoist maintaining that a new set of facts over a period of time bestows a truly legal character upon the new political organism. In short, the line of demarcation between defactoism and legitimacy must in the final analysis be a relative one.

Although recognition does not bring into existence a new state and although a state possesses the attributes of sovereignty independently of recognition, the state is assured of exercising these attributes only after recognition. Recognition may be either tacit or express and either conditional or unconditional. It is absolute and irrevocable, although the recognized state may refuse to accept it. To be definitively effective recognition must be granted by a government which is itself recognized. No state is legally bound to accord recognition, although there may be a moral obligation to do so. Recognition may be granted by a state acting alone or by a group of states acting in unison. Examples of the latter are the recognition of certain Balkan states in 1878 and of Belgium in 1831. While there are no absolute rules governing the recognition of new states, the new political community must at least possess the essential characteristics of a state. Premature recognition, granted while a bona fide contest between a parent state and belligerent insurgents is still in progress, constitutes an act of intervention, which may possibly lead to war. As the term is used here, the recognition of belligerency and insurgency is excluded from consideration (*see* BELLIGERENCY; INSURRECTION).

In international law states have a continuing personality which is not affected by changes in their governments. The duties of the state are not altered by internal political changes, which represent breaches in constitutional law alone and not breaks in the "legal continuity of international relationships." For this reason the recognition of a new state may be considered as an act of deep legal significance, whereas the recognition of a new government may be regarded as a question of policy. In both cases, however, it is the political organism of the state with which the recognizing powers must deal, and the same methods of recognition are applicable.

The methods of according recognition are varied. It may be granted by a formal declaration in a separate and independent document or by carrying on such negotiations or entering into

such relations as exist only between independent states. Diplomatic intercourse and treaty negotiations may be conducted in such a way as to result in recognition. The dispatch of an accredited representative, the reception of accredited diplomatic agents or the issuance of an exequatur to a consul would have this effect. However, the mere conclusion of a treaty between the recognizing and the recognizing state or the signing of a collective treaty between the recognizing state and the recognizing states does not necessarily mean complete recognition. Two governments, one of which does not desire to recognize the other, could nevertheless regulate certain matters by treaty. And after the conclusion of a multipartite treaty it need not be said that each of the signatory governments recognizes each other government except for the purposes for which the treaty was concluded. The United States, by adhering to the Paris Peace Pact of 1928 along with Russia, did not recognize the Union of Soviet Socialist Republics except for the one purpose involved. It follows that mere admission to an international congress would not constitute a general recognition. Further the holding of certain kinds of intercourse with a foreign government, as with the agents of a revolutionary body, does not necessarily signify the according of recognition. The nature of the act, the circumstances and the intention of the recognizing state must all be considered.

The recognition of a new state or government is generally regarded as an act of the executive. Although it has been asserted from time to time in the United States that a concurrent power of recognition or a voice in the granting of recognition is vested in Congress (see Resolution of the Committee on Foreign Affairs of the House on Dec. 15, 1864), the power of the president has been exercised, as it could be, in an almost exclusive fashion. Some of the methods of according recognition are completely in his control, and the extent to which Congress or the Senate plays a part depends in the last analysis upon the methods employed and considerations of expediency.

To Thomas Jefferson, the first secretary of state in the United States, may be attributed the institution of the concept of recognition in international law. If his theories of popular sovereignty and the right of revolution formed a necessary predicate for the inception of recognition, the fact that Jefferson was in a position to give his ideas practical application makes him a significant figure in the origin of the recognition

concept. As early as 1792 political changes in France necessitated the formulation of an American policy; and Gouverneur Morris, minister of the United States to France, was accordingly instructed that "it accords with our principles to acknowledge any government to be rightful which is formed by the will of the nation substantially declared." Later pronouncements were phrased in similar language, and their application has given rise to the view that Jefferson's was a policy of pure defactoism; indeed, with the exception of two periods in American history, it has been traditional to characterize the entire American policy as being one of *de facto* recognition. The two exceptional periods were from 1861 to 1869 and from the inauguration of Woodrow Wilson in 1913 almost to the present time. During these years the United States is said to have reverted to the principles of legitimacy and by the positing of certain requirements to have reapplied the old doctrine through an insistence upon "constitutional government." Even if the tenuous line which divides defactoism and legitimacy be ignored, it cannot be held that the recognition policy of the United States has ever been characterized by the application of principles of pure defactoism. It has been rather a policy marked by an insistence upon the popular support of the government in the state, a support or approval which has been satisfactorily evidenced at times by mere *de facto* control and at other times, when special reasons presented themselves, by the requirement of more formal evidence, such as is afforded by plebiscites or constitutional conventions. Consequently the insistence upon the present and the future stability of the government to be recognized as one of the criteria for granting recognition was from the beginning and has remained incidental to the requirement of popular sanction. A demand for popular acquiescence might have been expected from a government of revolutionary origins, presumably based upon the "consent of the governed" and possessing a missionary zeal to further the establishment of republican governments in a period when they were the exception rather than the rule. Secretary Stimson's reestablishment of the "sensible practice of our forefathers" represented then no fundamental break with the policies of his predecessors.

The second of the criteria for according recognition which find expression in communications from the Department of State is the ability and willingness to fulfil international obligations.

tions. Although probably implied from the beginning, this requirement did not find formal announcement until the annual message of President Hayes on December 3, 1877. As the interests of the United States in foreign states have expanded, greater and greater emphasis has been placed upon the second of these criteria. At the same time the "international obligations" have been colored by American self-interest and since 1900 have offered ample opportunities for the fulfilment of conditions or the granting of privileges as prerequisites for recognition. In 1904 recognition was secured by the Morales regime in Santo Domingo at the price of acquiescence in all of the engagements previously entered into between the Dominican Republic and the American legation. Recognition of the Obregón government in Mexico was delayed from November, 1921, to August 31, 1923, because Obregón refused to sign a treaty drafted by the State Department and containing stipulations for the safeguarding of "American property rights in Mexico." Hasty recognition of new states and governments, as in the case of Panama in 1903, has been a factor in their preservation; and the non-recognition of de facto governments, as in the case of Huerta in Mexico in 1913-14, has been a factor in their downfall. When so exercised the power of recognition comes to have a constitutive form which, at least in the case of Latin American states, has a vital effect upon their political vagaries.

Two recent cases of the failure to recognize new states or new governments are those involving the Union of Soviet Socialist Republics and Manchukuo. President Wilson's refusal to recognize the Soviet government was not altered during the administrations of Presidents Harding, Coolidge or Hoover. Secretary Hughes' insistence in 1923 that the United States would not recognize the Soviet government until it "acknowledged its liability for the debts contracted by previous governments of Russia," agreed "to make restitution to American citizens whose property was confiscated" and "ceased its revolutionary activity in the United States" represented the reasons officially given, and subsequently repeated, for its failure to act. After the inauguration of President Roosevelt in 1933, however, this policy was reversed, and the United States followed the precedents set previously by all of the world powers in recognizing the Soviet Union.

The formal declaration of independence from China of Manchuria and Inner Mongolia on

February 18, 1932, followed a public statement by Secretary Stimson on January 7 to the effect that the United States "does not intend to recognize any situation, treaty or agreement which may be brought about by means contrary to the covenants and obligations of the Pact of Paris of August 27, 1928, to which treaty both China and Japan, as well as the United States, are parties." The formal request on March 14 of the new state of Manchukuo for recognition was ignored by the United States. The assertion in the report of the Lytton Commission that the recognition of the new regime in Manchukuo would not be "compatible with the fundamental principle of existing international obligations" is apparently accepted by the Department of State of the United States.

Such concerted international action in refusing to recognize a new state is hailed in some quarters as a new instrument of international law. Professor Quincy Wright has declared that if these principles "were really made effective, international law would be revolutionized. Violence and war would cease to have value in advancing the legal position of states." Critics of this so-called doctrine of non-recognition assert, however, that mere refusal of recognition is unlikely to accomplish its ends and may result in positive harm by encouraging China to attempt to recover her lost territory by force and by generally weakening confidence in the preventive value of peace machinery.

Within recent years some efforts have been made to standardize the rules governing recognition. The International Commission of American Jurists, which met at Rio de Janeiro in 1927, recommended that recognition be granted only when certain stipulated conditions had been met. In the future, however, little uniformity of action may be expected in the matter of according recognition, even should there be an acceptance of general principles.

RECONSTRUCTION. Shortly before his death Abraham Lincoln inaugurated a program for the speedy restoration of the southern states; this program was based upon the belief that leniency and fair treatment of the defeated foe would most effectively reestablish "the proper practical relations" of the union and secure to the Negro the rights necessary to his development. Under this policy any seceded state or portion of a state was to resume its place in the union whenever one tenth of the voters who were eligible in 1860 and who had taken the oath of loyalty should set up a government; by April, 1865, such governments were functioning in Tennessee, Louisiana and Arkansas, while a loyal rump group had been recognized in Virginia. In his organization of these governments, in the Hampton Roads Conference, in his second inaugural and in a carefully prepared speech made three days before his assassination Lincoln gave abundant evidence of his desire for the prompt reconstitution of the seceded states.

Andrew Johnson has been unjustly blamed for the failure of the moderate program of restoration. The Radical Republicans attacked his policy by calumniating him, and so successful were they that only a caricature of him has been handed down to posterity. The fact is that Johnson had more than average abilities, high devotion to duty and to the union, perseverance, industry, integrity, indomitable courage, and an almost religious faith in democracy and the good judgment of the masses. In a day when passions ran high he had the understanding and calm judgment to formulate and pursue unwaveringly a southern policy that posterity generally regards as wise. His greatest weakness was the fact

that he was an outsider who did not understand northern opinion. He did not hold the reins of power in the dominant party; indeed he was not even a member. Aligned against him were all the men in the Republican ranks who had attacked Lincoln bitterly, even during the war. Lincoln would have had great advantages of personality and experience that Johnson lacked, but it must not be forgotten that the same forces which ruined Johnson might have destroyed Lincoln, had he lived.

In pursuit of the principles laid down by Lincoln, Johnson on May 29, 1865, announced his program in two proclamations. The first granted amnesty with restoration of property, except slaves, to all but fourteen excepted classes of former Confederates, conditional upon their taking an oath of future loyalty. To individuals excepted from amnesty he issued pardons freely when they were asked. In the second proclamation, soon followed by others for various states, he appointed a provisional governor for North Carolina and turned over to those of the voters of 1860 who had taken the oath full power to reestablish a loyal government and normal relations in the union. Johnson refused to permit unpardoned rebels to vote or to hold office. He made three positive demands: repeal of the secession ordinances, ratification of the Thirteenth Amendment, and repudiation of rebel debts, Confederate and state. He urged the states to protect the civil rights of Negroes and would have favored limited Negro suffrage, but refused to impose these measures upon states against their will. His provisional governors were wisely chosen and he himself worked tirelessly and patiently under extraordinary difficulties to restore the southern states and to insure their future loyalty.

Southern society was chaotic. The whole social and economic order had collapsed. A war for which many of its leaders had been eager had left the South impoverished and exhausted, with its means of production destroyed. In this condition it had to make social and economic adjustment to a new order. It was torn by dissension between its moderate leaders, who wished to accept defeat and emancipation and adjust themselves as speedily as possible to existing conditions, and extremists, who, unwilling to face the consequences of defeat, sought to restore the old order in defiance of northern opinion and grim reality. Many states elected their old leaders to office, often before they were pardoned. This was human and un-

derstandable but patently unwise. Extremists opposed repeal of secession ordinances already nullified by the inexorable verdict of war. They objected to repudiating their Confederate debts. They enacted "Black Codes" which looked like reenslavement of Negroes. These codes, like many other impolitic acts, resulted in part from stubborn effort to restore the status quo ante, in part from an honest effort to work out a *modus vivendi* under extremely trying and unaccustomed conditions of life amidst newly freed Negroes unused to freedom. But southern actions put a powerful weapon into the hands of northern enemies of restoration.

Northern opinion itself was divided. The large but discredited minority which had opposed the war now sought to restore the South at once and on almost any terms. Many War Democrats and Lincoln Republicans also favored magnanimity and speedy restoration, but on Johnson's terms. On the other hand, a Radical minority were determined to keep the South out of the union or under military control until, through white disfranchisement and Negro suffrage, it could be "renade on a northern model" and permanent rule of the nation by the Radical faction could be assured. When Lincoln died, a great majority of northerners favored his and Johnson's policy. The Radical leaders, realizing that they were in a hopeless minority even in their own section, sought delay while they "educated" the people to extreme measures; and so successful were they that between April, 1865, and November, 1866, they were able to win over a group of adherents large enough to give them two-thirds control of a Congress from which southerners were forcibly excluded. This change of popular heart was accomplished by a campaign of misrepresentation and vituperation which blinded the public to the vital problems confronting the nation.

Indeed behind the smoke screen of Radical rodomontade were concealed issues whose solution would determine the fate of the United States for decades to come. The first of these was whether southerners could be trusted to return to participation in the union. While many northerners honestly believed that the former slaveholders were inherently wicked and that allowing them to regain political power would destroy the union, the Radical Republicans were more realistic. They opposed restoration of an unreconstructed South largely because they realized that it made probable a

combination of southerners with northern Conservative Republicans for the purpose of breaking the Radical control over Congress. The much discussed question of the dangers attending southern restoration was in reality therefore only a political device designed to keep the Radicals in power. The same was true of the Negro question. Men like Charles Sumner were sincerely interested in the Negro's welfare and determined to protect him against reenslavement; for the most part, however, Radical politicians felt concern over the Negro because he would vote Republican. Radical leaders were determined from the first to stay in office by giving the Negro the ballot, but too much opposition to Negro equality existed in the North to permit this to become an avowed issue of the congressional campaign of 1866.

The Fourteenth Amendment contained four distinct measures incorporated by the Radicals into one. Section one protected the civil rights of Negroes. Section two provided that if the Negroes were not allowed to vote, southern representation should be reduced according to the proportion of Negroes to the total population. Section three disqualified from holding public office all persons who, having held any civil or military office, however petty, under the United States or under any state, had then violated the oath of allegiance required for that office by voluntarily supporting the Confederacy. Congress alone by a two-thirds vote had the power to remove such disability. Section four repudiated the Confederate and guaranteed the federal debt.

The punitive section of the amendment was calculated to leave the South leaderless in the most trying period of its history; it was inevitable that its inclusion should make the whole amendment intolerable to southerners as well as to Johnson Conservatives in the North who might have accepted the other sections. The Radicals, however, refused to allow the different measures in the amendment to be presented separately; they were thus able to claim that Conservatives who objected only to the punitive clause were opposed to the more moderate portions. Bondholders, for instance, were convinced that the repudiation of the federal debt could be prevented only by the election of Radicals. By introducing a bill guaranteeing restoration upon ratification the Radicals led moderates to believe that the amendment embodied their definitive terms to the South, while, by failing to pass the bill, they left the door open to complete subjugation.

tion of the southern states when they had obtained a two-thirds control of Congress. Thus the Fourteenth Amendment played an important but purposely confused part in the Radical victory.

Economic questions, which really were at the heart of the Radical attack on the South, were kept in the background. The real danger from "the return of rebels to power" was not the overthrow of the union but the ousting of the new industrial forces from control in Washington by a renewed combination of southern planters and western farmers. Significant economic policies of the day still to be determined in permanent form were the questions of congressional extravagance, the incidence of taxation, contraction or inflation of the currency, the payment of federal bonds in gold or depreciated greenbacks, the role of the new national banks and the government's attitude toward the monopoly practices and corrupt methods of big business and toward the spoliation of the public lands for private gain. Of particular importance was the tariff question. High tariff men had been in a hopeless minority before the war. After the southerners withdrew from the union, they were able to obtain tariffs high enough not only to offset huge war taxes on industry but to afford additional protection against foreign goods as well. Then, by keeping southern representatives out of Congress and winning western farmers with a wool tariff, the protectionists were able to retain the war duties after the war taxes which they offset had been repealed. These were the economic issues upon which Radicals did not dare permit the "unreconstructed" South to pass judgment. Indeed northern opposition to the position of the Radicals was so keen that these questions were persistently excluded from political discussion. For years all criticism of the Radical program—which meant governmental support of big business—was effectively silenced by appeals to mob hysteria, such as the "waving of the bloody shirt" or the invoking of the sectional loyalties.

Radical leaders outgeneraled Johnson superbly. The president saw that the Radicals were determined from the beginning to proceed to extreme measures. Believing that to yield or to compromise on any point would mean ultimate defeat, Johnson refused to approve important matters concerning the South until southern states were permitted to participate in their enactment. This explains his opposition to bills

which ordinarily he would have accepted; it explains also his refusal to advise the South to ratify the Fourteenth Amendment. But Johnson committed an unfortunate blunder when he failed to oust all the Radical officeholders, with the result that the Radicals were able to wield the great patronage power against him. He erred further in permitting the Radicals to confuse and conceal the really important issues of the day, for his own position on these, particularly the economic ones, would have obtained majority support even in the North. The moderate third party movement, which could have swept the North, failed because the Philadelphia Convention of 1866 did not create a new party with party machinery and candidates; Conservative Republican voters in November, 1866, were therefore faced in most cases with the dilemma of choosing between Radical and Copperhead candidates. In spite of all this the Radical victory in 1866 in many states was won by only a slight majority. By no stretch of the imagination, then, could it be construed as a verdict in favor of Radical reconstruction. It was this election, however, which gave the Radicals the two-thirds majority in Congress which permitted them to carry out their southern policies unopposed.

The momentous Reconstruction Act, embodying the Radical program, was passed on March 2, 1867. It divided the former Confederate states (save Tennessee, which had ratified the Fourteenth Amendment and been readmitted into the union) into five military districts, where martial law was to prevail. It established provisional state governments, which could be abolished or changed at the will of the federal government. It ordered the election of delegates to constitutional conventions, with all adult males participating, regardless of color, except the southern leaders disqualified from officeholding by the Fourteenth Amendment. Upon the framing of constitutions which included provision for Negro suffrage and upon the ratification of the Fourteenth Amendment and the approval of the new constitutions by Congress, the seceded states would be ready for readmission; but no person could be elected to Congress who could not take the "ironclad oath" that he had never fought or held office under the Confederacy or in any way supported it. By 1868 five states, besides Tennessee, had been readmitted after meeting these onerous terms.

As late as the presidential campaign of 1868 the Republicans had not dared to include Negro suffrage for the North in the party platform. But

soon after their victory in the election they passed the Fifteenth Amendment, which provided that the right to vote should not be denied "on account of race, color, or previous condition of servitude." The amendment was ratified by March, 1870, but like the Fourteenth could not have been ratified at all except by forced rule of the South. As southerners became more and more restive under Radical rule, Congress enacted more extreme measures during 1870-72: laws to enforce the Fourteenth and Fifteenth Amendments; to protect Negroes against infringements of rights by individuals as well as by states; to grant jurisdiction to the federal courts in cases involving racial equality; to provide federal supervision of elections; to empower the use of military force to protect Negroes; to legalize suspending the writ of habeas corpus; and to penalize heavily the activities of the Ku Klux Klan. Just before they lost control of the House in March, 1875, the Republicans enacted a new civil rights law.

But the end was near. The excesses of the rule of carpetbaggers, "scalawags" and Negroes, most of the last as yet unfitted for public office, threatened to complete the ruin of the South. The old governing class of the tidewater and the small farmers of the up-country areas, whose relations had traditionally been hostile, now joined hands to combat the common foes, the enfranchised Negroes and their northern carpet-bagger friends. Nor could a military dictatorship be maintained permanently over a whole people; and, as soon as northern troops were withdrawn, southern whites, by open disregard of laws and the constitution, by intimidation of the Negroes and mob violence, took power back into their own hands. Northerners too had grown tired of trying to rule the South by force. They became eager to decide the vital economic issues which reconstruction politicians had evaded. It therefore became increasingly difficult to mobilize public opinion in support of the drastic measures necessary to keep the South Republican. In 1871 the "ironclad oath" was repealed; in 1872 Congress granted a general amnesty; and in 1877 President Hayes removed the last of the federal troops from the South. With northern support gone, the Republican-Negro governments were captured by the whites and for fifty years the South continued solidly Democratic.

Constitutional questions bulked large in the discussions over reconstruction. The southern states had justified their withdrawal from the

union by the theory that the constitution was a compact between sovereign states, which any state could abrogate when it ceased to serve the purposes for which it had been drawn up. The North justified its going to war to force unwilling southerners to stay in the union by the theory that the United States was an indestructible union of states no longer sovereign, from which no state could secede since every citizen of every state was also a citizen of the United States and owed supreme allegiance thereto. With the war ended, Johnson sought to restore the seceded states on the basis of the indestructible union theory; but this no longer served the purposes of the Radicals. Some of them now espoused a "conquered province" doctrine which denied southerners all rights save those the victors wished to grant; others reconciled their 1861 claims that states could not secede with their 1865 desire to deny them statehood by insisting that the southern states through rebellion had lost their status as commonwealths and had reverted to a territorial condition. Southerners, on the other hand, argued vigorously for the unimpaired rights of states. Actually, constitutional arguments were merely rationalizations of the economic and political desires which determined the respective programs. It was not constitutional precedent therefore but force of arms which led the Supreme Court to rule in *Texas v. White* [74 U. S. 700 (1869)] that the ratification of the constitution in 1788 had solemnized an indestructible union and that Congress had the power to approve or reject the governments of the southern states.

In discussions of constitutional precedents to support or deny the right of secession or the territorial status of southern states, the attempt of Radicals to overthrow the traditional form of American government has often been overlooked. The Radicals actually sought to concentrate power in the national government by substituting close centralization for the existing federal system and by transforming the states into mere administrative subdivisions. In place of the federal checks and balances they wished to set up a parliamentary system with executive, courts and the constitution itself subordinate to an omnipotent Congress. For three years President Johnson was kept helpless not only by the fact of a two-thirds majority which could always override vetoes but by specific legislation which took administrative power out of his hands, even to the extent of forbidding him to dismiss his own appointees without congressional consent.

Had the Radicals succeeded in removing Johnson, the president would have become a puppet in the hands of Congress; indeed the Supreme Court might easily have been the next victim. As it was, the court was for years cowed into avoiding decisions which would offend Congress. While *ex parte* Milligan [71 U. S. 2 (1866)] did declare military tribunals unlawful even in war time when the civil courts were functioning, this decision was not handed down until the Civil War had been safely over for two years. When the constitutionality of radical reconstruction was brought before it, the court dodged the issue; and in *Georgia v. Stanton* [73 U. S. 50 (1867)] and *Mississippi v. Johnson* [71 U. S. 475 (1867)] it found reasons for refusing to assume jurisdiction. In *Texas v. White* in 1869 it merely registered the result of the war and the will of the Radicals. It was not until public opinion had turned and the Radicals had lost control of Congress that the Supreme Court dared place its stamp of unconstitutionality upon Radical reconstruction in *United States v. Cruikshank* [92 U. S. 542 (1876)], *United States v. Reese* [92 U. S. 214 (1876)], the Civil Rights Cases [109 U. S. 3 (1883)] and *United States v. Harris* [106 U. S. 629 (1882)].

Reconstruction bequeathed an important heritage to the South. Here it brought years of suffering, the decline of the old aristocracy, the rise to political power of the white masses from the up country and the social and economic revolution which has created the "new South." Slavery was destroyed, but reconstruction did not solve, indeed it actually complicated, the social and economic problems of ignorance, inefficiency and racial differences that had existed under slavery. In spite of the presence of the easily circumvented post-Civil War constitutional amendments reconstruction left the southern Negro without adequate protection of his newly acquired civil rights, virtually without the ballot, socially inferior, economically exploited, and with scant means of improving himself or his status. From reconstruction the nation inherited a "solid South." To the South this has meant that its attitude toward national problems has been completely dominated by the necessity of maintaining a united front against the Negro; to the Democratic party it has meant the presence of a bloc of conservative votes great enough to prevent the party from becoming a truly liberal organization; to the nation it has meant political derangement caused by the inability of various groups in the south to join

similar groups in other sections against common opponents.

Reconstruction also left an important heritage to the North. The Fourteenth Amendment, presumably passed to protect the Negro, has been utilized by the Supreme Court to prevent the enactment of social legislation opposed by property interests and the public regulation of business practises. Also by a clever use of popular shibboleths northern industrialists, working through their allies, the leaders of the Republican party, succeeded in focusing national attention for almost a dozen years on the single question of reconstruction, while by preventing the union of the South and West, they were able to overpower the agrarian forces, the really dominant class in the country. In 1865 the new industrial forces would have been easily outvoted. But during the long years of reconstruction a new economic and social order was being nurtured to maturity by tariffs and other governmental favors and special privileges. By the time reconstruction ended and the South and West were permitted to combine politically once more, modern industrialism was too strong to be controlled. The age of big business had dawned. Radical reconstruction did not cause industrialization, but these years of undisturbed business control of the government molded its course.

RECORDS, HISTORICAL. According to the English Public Record Act of 1838 records include "all rolls, records, writs, books, proceedings, decrees, bills, warrants, accounts, papers, and documents whatsoever of a public nature." Some archivists, like Hilary Jenkinson, find even this definition too general and all inclusive and would restrict the term to certain types of legally authenticated documents. While this position deserves recognition, there does seem abundant justification for the use of the term in its wider acceptance as including all forms of data, whether written or unwritten, that may be employed as sources for the reconstruction of the life and activity of man in the past. In this sense it will be employed in the present discussion.

The concept of historical records will thus be as broad as any particular definition of history. On this question there is no consensus of opinion. In general the dominant interests of any age will condition the scope and content which will then be given to the history of past ages, and this in turn will determine the type of materials to be employed as historical sources. In an age when history is looked upon as a branch of literature the historian may be almost solely dependent upon literary records; that is, annals and chronicles. This view was long prevalent prior to the eighteenth century, and for some generations thereafter dependence upon the written record still remained predominant.

The industrial and political revolutions of the seventeenth and eighteenth centuries challenged the dominant position of the ruling class and

increased interest in social and institutional history. This was further intensified by the development of new sciences in the nineteenth century which opened the eyes of historians to new types of materials for the study of man's past, of which for the most part they had hitherto been unconscious. Among these archaeology has made the most interesting contributions, but ethnography, anthropogeography, philology and iconography have also greatly enriched the concept of history. In 1837 Thomsen, a Danish scholar, gave great impetus to the scientific study of archaeology; he set out to make a careful collection and classification of tools, weapons, artifacts with a wide variety of uses and physical remains of primitive man and to relate them to the geological strata in which they were embedded and to the flora and fauna with which they were found. Already a generation earlier the scientific study of pre-Greek civilizations in the Nile and Tigris-Euphrates valleys had been initiated. Since that time there has been gathered, classified, studied and interpreted an ever growing body of such materials from all over the world; while they are incomplete because the written record is lacking, they have been of immense value to the historian, assisting him to reconstruct the outlines of man's past extending back hundreds of thousands of years and thus enabling him to secure a better perspective on the few thousand years for which written records exist.

The more obvious types of historical records fall roughly into two main classes, written and unwritten. Among the latter are the physical remains, both human — hair, bones, and the like — and geographical records of the earth's crust, its climate, topography, flora and fauna, soil character, waterways, mountain barriers, plains, deserts and woodlands; in short, all those geographical agencies which operate as conditioning factors in the life of man and as such must be given due consideration in the treatment of any historical question.

Material remains, archaeological and monumental, are probably the most important of the unwritten records by virtue of their abundance and also, in primitive or early classical civilizations, because of the scarcity or entire lack of other contemporary records. Among these are to be mentioned: clothing, tools and weapons; coins, medals, seals, heraldic devices; objects of art and luxury, including jewelry, carvings in wood and enamel and sculptures in stone; metal work in all its variety and intricacy, glass and

textiles of various sorts; burial mounds, menhirs and dolmens, temples or shrines; theaters, colosseums and triumphal arches; town halls, castles and the humbler dwellings of burgher and peasant. The value of this type of material for the reconstruction of the life of primitive man is now fully recognized, but historians are not always alive to its significance for a period for which written records have become relatively abundant. Rostovtzeff has emphasized its worth as an aid in interpreting life in the classical period of Greece and Rome; Alfons Dopsch in his *Wirtschaftliche und soziale Grundlagen der europäischen Kulturentwicklung* (2 vols., Vienna 1918-20) has illustrated its use in reconstructing economic life in Europe in the early Middle Ages; and within the last few years historians of art, by relating their materials to other types of historical sources, have contributed greatly to contemporary knowledge, particularly of the Middle Ages. There is more history in a Gothic cathedral than in many tomes of written records.

On the border line between unwritten and written records are the linguistic and the ethnic records. At the opening of the last quarter of the nineteenth century the philologists claimed to hold the key to the explanation of virtually all history. Further study has modified these extreme views considerably, but the record of language can by no means be ignored. Especially in the scientific study of place names much light is being thrown upon obscure pages of history. A careful study of surnames in certain periods of the Middle Ages may reveal much of the development of industry in a given region; while phrases, proverbs, names of common things of everyday use, may provide a clue to the cultural affinities of a people and thus to their history. Such evidence must be used with caution, since nothing is more easily adapted and adopted than language, but in the hands of a carefully trained philologist it may be of great historical value. Much the same is true of myth, legend, folklore, ballad, epic, anecdote and tradition. There was a time when these were discarded as useless for historical purposes, but if scientifically studied and sifted they may yield valuable data, especially where they are controlled by other types of sources. This has been strikingly evidenced, for example, in the substantiation of Greek myths by excavations at Troy and Crete.

With the rapid development of photographic and cinematographic processes, graphic, pic-

torial and sound records are steadily becoming more significant. Graphic and pictorial records, such as charts, maps and portraits, have long been utilized as important sources by the historian; but the perfecting of the camera and the combination of photography and sound reproduction have introduced an entirely new element. It is necessary only to mention the still and motion pictures taken during the operations of the World War and the so-called "record of events" daily exhibited upon cinema screens to indicate the tremendous significance of this type of record for the student of contemporary history.

As the concept of history expands and the political preoccupations of historians give way to interest in cultural aspects of man's past, these various types of record take on new meaning and significance. But after due consideration is given them, the chief reliance of the historian must still be upon the written record.

These written records are of many kinds. They may be graven on stone, pressed in clay or written on papyrus, parchment or paper. They may employ pictorial characters, symbols or alphabet, requiring tools of different sorts in their writing and demanding various skills, such as epigraphy, papyrology, palaeography and diplomatic, in their deciphering and interpretation. It must suffice here merely to name some of the more important. First come inscriptions, of which valuable and convenient collections have been made from classical times—the *Corpus inscriptionum graecarum* (Berlin 1873—) and the *Corpus inscriptionum latinarum* (Berlin 1863—)—and of which perhaps the two most notable examples are the Behistun rock and the Rosetta stone, although their importance is by no means limited to the classical and preclassical age. Second come annals, chronicles and histories, the first consisting of brief jottings year by year, the second at its worst barely distinguishable from the annals and at its best shading into the histories. Third, poems and songs, epic, lyric or didactic, historical or imaginative, may be of great historical value. Fourth, there are documents of an official or quasi-official character, by which the narrative sources mentioned above must be supplemented and corrected; these include laws, decrees, all types of legally authenticated papers, municipal, manorial or corporation records, tax and rent rolls, census and other statistical materials, court records and notarial registers. There was great dependence upon this type of record during the latter half of the nineteenth century especially, and they must always

be employed to afford the framework for any historical synthesis. It is now realized, however, that even legally authenticated documents may be tendential and either wilfully or negligently erroneous. Historians are coming more and more to realize that they need to be vivified by a more vital type of record. Fifth, letters, diaries and memoirs constitute a group of materials ranging all the way from semi-official papers to the untrustworthy and hazy recollections of old age; the former two may be of extreme value as reflecting the day by day impressions of men in significant positions in political or civil life of events in which they may have been chief actors. Sixth, newspapers, periodicals and pamphlets also afford living records of the trends of thought and opinion regarding matters of timely interest.

In a broad view of history the historian is thrown into close association with and often dependence upon associated disciplines or sciences, both for the collection and for the interpretation of data of which he must make use. Traditionally there have been enumerated certain techniques, or "sciences," "auxiliary" to history: epigraphy, or the deciphering of inscriptions; palaeography, or the science of old handwriting; diplomatic, the science of the analysis and interpretation of documents, involving knowledge of the different methods of reckoning time, of the formulæ employed by various chancelleries at different periods and of the conventions used in the authentication of documents; numismatics, sphragistics and heraldry. While knowledge of these techniques is indispensable in the handling of certain types of historical records, the relation of the historian to workers in allied fields is of even greater significance. His dependence upon the geographer, the geologist, the archaeologist and the philologist for the gathering and interpretation of certain types of sources has already been commented upon. But no less close are his contacts with the sociologist, the anthropologist, the social psychologist, the economist and the statistician. The more he is concerned with man as a social being, the closer are these lines of contact drawn; and, despite the efforts of those who would attempt clearly to define the methods and objectives of each and thus to differentiate between them, it seems clear that the drift is toward a synthesis of the so-called social sciences. The contribution of the historian would then be in the method of approach and the perspective which the discipline of his subject matter imposes upon him,

and from which students in allied fields might well profit.

No discussion of historical records would be complete without some reference to the work of scholars in collecting and editing sources. A beginning in this direction was made, even before the invention of printing, in the *Specula*, most notable of which was that of Vincent of Beauvais in the thirteenth century. Very soon after printing became established, the collecting and editing of records began on a large scale. Much of this work was done hastily and uncritically, with little or no attempt to collate manuscripts, to discover the best manuscript of a given work or to furnish adequate apparatus in introduction or notes. Such were the *Monarchia Sancti Romani Imperii* of Melchior Goldast (3 vols., Hanover and Frankfurt 1611-14) and the *Maxima bibliotheca veterum patrum* of Margarinus de La Bigne (8 vols., Paris 1575; enlarged ed., 27 vols., Lyons 1677). Most notable in the early work of editing texts was that of the Congregation of Benedictines of St. Maur and of the Jesuits under the leadership of Jean Bolland. From the former, commencing with the early seventeenth century, has proceeded a number of important collections of sources and critical studies. Jean Mabillon's *De re diplomatica* (Paris 1681), which initiated the scientific study of palaeography and diplomatic, is indicative of the critical scholarship which went into their work. Best known of their collections of sources is the *Rerum gallicarum et francicarum scriptores*, or *Recueil des historiens des Gaules et de la France*. The plan of this work was conceived by André du Chesne in the seventeenth century, but he died when it was only begun. In the following century it was taken up by the Benedictines and under the editorship of Dom Martin Bouquet the first eight volumes of the *Recueil* appeared (1738-52). After Dom Bouquet's death his colleagues took over the work and several additional volumes were published. Following 1796 publication was continued under the auspices of the Académie des Inscriptions et Belles Lettres and the work was completed (1904) in twenty-four volumes, comprising a valuable collection of narrative sources together with some sampling of official documents in the later volumes. The great accomplishment of the Bollandist fathers has been the collecting, sifting and editing of the lives of the saints, *Acta sanctorum*, the first volume of which was published by Bolland in Antwerp in 1643; this work is still in process of publication. These

must serve as illustrations of what is best in the editorial work of ecclesiastical foundations. Obviously much of it, especially in the early volumes, is far from perfect. But the men who worked upon it were gradually perfecting techniques by which their successors and those engaged in similar enterprises have greatly profited.

Another class of publication comprises the great national collections, born largely of the desire to emphasize the importance of national history and to enhance the nation in popular esteem. Such is the *Monumenta Germaniae historica*, begun in 1826 by G. H. Pertz and still not completed, which attempts to collect the sources for German history from 500 A.D. to 1500. Much of the critical work in this series is admirable; some has needed to be redone in the light of new knowledge or new manuscripts. On the whole, however, it serves as a model for this type of collection. England in *Rerum britannicarum medii aevi scriptores*, or *Chronicles and Memorials of Great Britain and Ireland* (1858-1911), published under the auspices of the master of the Rolls; France in the *Collection de documents inédits sur l'histoire de France* (1835-), published under the auspices of the Minister of Public Instruction; Spain in *Colección de documentos inéditos para la historia de España* (1842-95); and Italy in *Rerum italicarum scriptores* (1723-51), now in process of reissue in an enlarged edition, have similar series. The Italian collection is notable as the first undertaking of its kind and also because it represents the work of a single editor, L. A. Muratori.

There are also important collections of materials for local history, such as that of the Surtees Society (*Publications*, vols. i-cxlvii, Durham 1835-1932); of special types of documents, such as the publications of the Pipe Roll Society (*Publications*, vols. i-xlvi, London 1884-1932) or the Selden Society (*Publications*, vols. i-l, London 1888-1930); of town or industrial records; and, of recent date, great collections of materials on contemporary diplomacy designed to substantiate the position of one or another of the participants in the World War, best illustrated perhaps by *Die grosse Politik* (40 vols., Berlin 1922-27).

With possible rare exceptions none of the collections of materials can be more than selections from the mass of historical data. Much of this has been collected with a special end in view, and all of it reflects either consciously or unconsciously the point of view of the editor

or editors who made the selections or of the group under whose auspices a given collection has been published. They are conditioned also by the quality of the workmanship which has gone into the collecting and collating of manuscripts and the preparation of the text. The personal equation will always remain, but with progress in technique, especially through the training of competent scholars by such an institution as the École des Chartes, the accuracy of the text and the quality of the critical apparatus have also greatly improved. The *Corpus scriptorum ecclesiasticorum latinorum*, for example, is a model of careful and scholarly editing.

RECREATION. The recognition of recreation as a social problem is largely the result of forces set in motion by industrial developments. Public entertainment of the spectacle type—elaborate pageants, athletic contests, chariot races and gladiatorial combats—fostered by governments in classic times partly as a means of allaying social unrest, languished during the Middle Ages, chiefly because of the disapproval of the Christian church and also because of social cleavages under which formal recreation became for the most part an upper class prerogative. The coming of industrialization with its concentration of population in urban centers brought recreation into new focus. The benefits of shorter working hours made possible by the introduction of the machine were offset by the high degree of fatigue resulting from mechanized, routinized occupations that inhibited not only physical activity but the exercise of creative capacity, which had

been possible to some extent under the craft system. It was this situation which drew attention to the importance of recreation as a community need and led to the development of the two major aspects of the recreation problem in its modern sense: commercial recreation and organized community recreation, or what might be called the recreation movement.

Commercial recreation owes its rise to the laissez faire system of the nineteenth century, which, in England and the United States, apart from sporadic philanthropic efforts failed to make necessary provision for the increased leisure of large sections of the population. The consequent assumption by private and commercial interests of the provision of recreation for financial profit rapidly developed into a large scale business enterprise, which at the present time represents millions of dollars in investment and in annual receipts. The description of commercial recreations as those in which a fee is charged is not altogether accurate, for not infrequently small fees are charged for public recreation facilities in order to pay for maintenance. A more accurate designation of commercial recreations would be those not provided and operated by publicly financed or philanthropic agencies but run primarily for profit. In addition to the traditional amusement enterprises commonly classed as commercial—the theater, including vaudeville and burlesque shows, motion pictures, billiard and pool rooms, street carnivals and amusement parks, dance halls, cabarets, night clubs and road houses—recent years have witnessed the development of swimming pools, summer camps, golf courses, tennis courts and skating rinks, all operated for financial gain. The commercialization of the public demand for recreation is further exemplified by professional baseball and football and by certain other sports, such as prize fighting and horse racing.

While recreation in general is to some extent correlated with the economic level of a population, this relationship applies particularly to commercial recreation. In the United States during the prosperous years following the World War commercial recreation in variety and extent probably surpassed that of any other country. Quantitatively commercial amusements are the most popular resource for the leisure time of the American people. In most cities where recreational surveys have been made it has been shown that with regard to volume of service commercial amusements are far more important than those which are privately endowed or publicly sup-

ported. Only scattered statistics exist, however, as to the total expenditures for commercial recreation. This is partly because of the varied and intricate character of commercial amusement enterprises and partly because no centralized method exists for reporting amounts paid for admission to places of amusement except in the case of those subject to taxation. In 1923-24, when federal taxes levied on practically all commercial amusements during the World War were still in effect, the total amount paid by the public of the United States for admission to places subject to this tax was more than \$768,000,000. Since all commercial amusements charging an admission of 10 cents or more were included, this figure probably covers moving picture and other theaters, concerts given for financial profit, baseball and football games, dance halls and amusement parks. On the basis of 85,000,000 admissions per week at an average admission price of 30 cents the amount spent in 1930 by the American public on motion picture entertainment has been estimated to be \$1,326,000,000. Computed from the federal tax paid by dance halls, cabarets, roof gardens and night clubs, the money spent on this type of commercial amusement for the year ending in June, 1930, amounted to approximately \$23,725,000. Another form of commercial entertainment which forged to the front during the 1920's is the radio. In 1930 the total retail sales of radios and radio parts reached \$500,951,000, apart from an estimated \$45,000,000 paid to broadcasting stations by advertisers. Pool, billiards and bowling have declined in recent years, but in 1920 the number of tables and alleys was 278,216. The attendance for a single day at the Coney Island amusement park in New York City is often 800,000. An estimate of the annual expenditures for a restricted group of commercial recreations in the United States for the decade ending 1930 was attempted by the President's Research Committee on Social Trends. The total arrived at was \$2,214,725,000, a figure probably far below the actual amount spent, inasmuch as there are numerous forms of commercial amusement for which no satisfactory estimates of expenditures can be made.

The unwholesome character of certain types of commercial recreation, their alliance with organized crime and vice, and their tendency to contribute to juvenile delinquency, have caused widespread popular agitation, which has resulted in varying forms of governmental regulation. The basis of such regulation is usually a sys-

tem of licensing and inspection, which in addition to restricting admissions, applies to physical conditions, including sanitation, ventilation, fire hazards and safety of buildings, and to the type of offering and the general conduct of the enterprise. In most communities this control is exercised through local municipal ordinances, although in some states there are laws governing amusements and public exhibitions. Occasionally a government goes even further than supervision and makes an effort to suppress commercial amusements which violate the social code or are considered a menace to public morals. Prohibitive legislation of this type has been applied to gaming devices, to gambling in connection with legitimate amusements and to dance halls or resorts fostering vice. Within recent years commercial interests have begun to exercise a voluntary control, endeavoring to improve the character of their enterprises as a means of court- ing public favor and attracting patronage. In many cities, for example, associations of managers or owners of dance halls and pool rooms have taken steps to set up standards and to bring pressure to bear within the trade to insure conformity to these standards. Motion picture producers are undertaking to exercise similar control nationally.

Growing realization of the importance of wholesome recreation led in the twentieth century to the development in the United States of organized community recreation as a public responsibility. Somewhat earlier, in an effort to mitigate the evils resulting from urban congestion, humanitarian and social reformers had sponsored the children's playground, the first type of organized recreation. During this same period the function of public parks, hitherto largely aesthetic, was widened to include provision for sports, games and other forms of outdoor recreation. Out of these scattered beginnings arose a concerted community effort to provide recreational facilities for all classes and ages. Private and philanthropic agencies were the first promoters of recreation, and such organizations as the Young Men's Christian Association, the Young Women's Christian Association, social settlements, women's clubs and parent-teacher organizations as well as industrial and labor groups lent their support to the movement and urged its development by governmental authorities. The extent to which the latter aim has been realized is apparent in the enormous range of recreational facilities which today are provided under municipal and some-

times state and national auspices. In most American cities provision is made not only for sports, athletics, swimming, boating and general outdoor recreations but for pageants, festivals, plays, community music, dancing and similar activities. Through the cooperation of the community center and the adult education movements civic and educational features are emphasized by means of debates, lectures and moving picture exhibits. Schools have extended their legal function to include equipment and leadership for many types of community recreation. School auditoriums have been supplied with stages for dramatics, portable school furniture has been installed so that classrooms may be cleared for all kinds of social occasions, evening classes in arts and crafts for adults are provided in many cases and neighborhood clubs are invited to use the facilities of the building for their activities. As public provision for recreation has developed, certain types of sport which because of their costly equipment were formerly available only to wealthy classes have been included in park planning. Golf links, tennis courts, polo fields, bridle trails as well as field houses containing bowling alleys and pool and billiard rooms have become common in public parks.

The War Camp Community Service organized during the World War helped greatly to accelerate the recreation movement, demonstrating as it did the beneficial effect of organized recreation in terms of community health and morale. The National Conference on Outdoor Recreation called by President Coolidge in 1924 drew attention to the numerous forms of outdoor recreation available in the United States and endeavored to coordinate national, state, county and municipal agencies in providing recreational facilities. One of the most important agencies in the development of a public opinion favorable to community recreation is the National Recreation Association, organized in 1906 as the Playground Association of America. Through its monthly journal, *Recreation*, its pamphlets, handbooks and numerous other publications, its field workers who assist communities with their programs, and its studies and surveys it has given both impetus and direction to organized recreation. It has been active in encouraging the provision of recreational facilities in rural communities where until recently, because of isolation on the one hand and the high per capita cost of leadership on the other, the movement had made little progress.

In the development of recreation as a new

form of public service varying types of administrative machinery have appeared. In several states early legislation authorized the expenditure of funds for play and recreational purposes by school and park boards. Since 1917 an increasing number of states have passed home rule recreation bills permitting cities to carry on year round municipal recreation programs under the direction of trained, salaried leaders. In some cases this legislation has provided for the administration of the work by a recreation commission, a method which is being applied in a variety of combinations with park boards, school boards or other municipal departments. Because of the range of functions which an administrative body must necessarily carry on, the majority of recreation leaders favor the coordination of all recreational activities, excluding the supervision of commercial recreation, in a single body with legal standing in the community and with adequate funds appropriated by the municipality. In 1915 only two states had enacted legislation empowering municipalities to create recreational departments as integrated elements of the city government. In 1927 twenty-one states had such laws.

Some notion of the extent of public recreation in the United States may be gained from the 1933 *Yearbook of the National Recreation Association*, according to which in 1932 there were 6990 outdoor playgrounds, 770 recreation buildings, exclusive of schoolhouses, 2052 indoor recreation centers, 1629 athletic fields, 4161 baseball diamonds, 472 bathing beaches, 374 golf courses, 1659 ice skating rinks, 108 stadia, 1094 swimming pools, 9267 tennis courts, 816 handball courts and 271 toboggan slides. A total of 12,684 separate play areas was reported, and 554 of these were opened for the first time in 1932. It was reported likewise that 1012 cities provided leadership for supervised facilities; 23,037 were paid and 9280 were volunteers. These cities voted bonds for recreation purposes to the amount of \$1,167,497.26, and budget expenditures for the year for public recreation totaled \$28,092,263.09, only about 3 percent emanating from private sources. In contrast with this record, figures for 1912 show that only 285 cities were maintaining supervised playgrounds and recreation centers, employing only 5320 workers and expending a total of \$4,020,-121.79.

In the administration of recreation, both public and private, a new profession has developed. Training courses for recreation workers are now

offered by some 400 educational institutions, and the National Recreation Association conducts a special school for recreation executives. High standards are set for scholarship, technical information, personal ability, leadership and character. Advanced study courses are required, and staff conferences are held at regular intervals to report upon and discuss recreation problems and programs designed to meet growing community needs.

Organized community recreation exists in only a few places in Europe, and where it does it may be said to imitate American methods. Theaters, opera houses, botanical and zoological gardens, art galleries and museums, which in most continental cities are municipally owned or subsidized, are customarily regarded as educational rather than recreational services. Furthermore, while it is true that since the World War interest in recreation has greatly increased in Europe, it has been concerned chiefly with workers' recreation. Trade unions and other labor organizations have made an attempt to organize leisure time activities for their members. Class divisions are everywhere apparent and many of the youth movements, with their emphasis on sports and physical activity, are religious or political in origin and are designed to serve only restricted groups. In countries where a dictatorship exists recreation is likely to consist of a superimposed program of activity with military preparedness as its dominant motive. This is largely true of the Italian *Dopolavoro*, instituted in 1925 primarily as a leisure time movement, and embracing nation wide educational and cultural as well as physical and recreational activities. Although admirable in scope, it is an integral part of a political technique and is not essentially an expression of popular interest, as is the case with public recreation in the United States.

Following the war an enormous increase in voluntary organized recreation, particularly in the field of sports, occurred in Germany. Nearly every large city boasted its athletic stadium or *Sportplatz* and all sorts of organizations, religious, political and social as well as the numerous branches of the youth movement, enthusiastically espoused recreation. The state lent its encouragement by granting subsidies to certain workers' sports federations. Hitler's accession to power, however, greatly altered the situation in Germany, and brought about a reversal to government imposed programs of recreation.

In Norway and Sweden, because of climatic

conditions, community recreation finds its best expression in winter sports. Aside from this emphasis, recreation in these countries has to some extent been circumscribed by the deeply entrenched system of formal gymnastics which dominates Scandinavian physical education and athletics. In Denmark recreation is promoted for the most part through the well established system of folk schools, while in Czechoslovakia it is centered in the *Sokols*, a nationalistic movement founded in 1862 which combines educational and cultural activities with organized sport, athletics and games. In the Scandinavian countries as in central Europe recreation has been receiving increased attention in connection with city planning, and in a number of towns provision has been made for new and enlarged park space and sports fields.

Belgium is one of the few countries on the continent where an attempt has been made at official provision for leisure and recreational activities. Before the eight-hour day became generally effective in 1921, the public authorities of several highly industrialized provinces appointed committees to formulate programs of recreation for workers and to provide facilities for their execution. The result has been the system known as *loisirs des ouriers*, which fosters playgrounds, community gardens, music, games, sports, gymnastics and educational lectures.

Complete indifference to recreation as a problem of public concern and conspicuous lack of recreation and leisure provision either official or unofficial have until recently been characteristic of France, where a tradition of individuality has frequently hampered the development of modern social welfare services. The same situation has prevailed in Spain and Portugal and in the Latin American republics. In the case of the latter English and American immigrants have within recent years introduced golf, baseball, soccer, tennis, cricket and other games, which are becoming popular among the natives. Public playgrounds modeled after those in the United States have been established under private auspices in Buenos Aires and Rio de Janeiro.

In England a traditional play spirit, largely spontaneous, offers little opportunity for supervised recreation. What organized recreation there is depends almost wholly on private initiative and backing and finds its expression through school and university organized sports, through the adult education movement and through industrial welfare. The last, rooted in a belief in the paternalistic method, enables a factory owner

or employer to provide recreational opportunities for his workers as part of a general welfare service. Recreational practise in English colonies for the most part follows that of the mother country and consists almost wholly of sports and competitive play.

The most significant example of a changed attitude toward recreation is to be found in Soviet Russia, where a comprehensive program including sports, athletics and cultural activities has been put into execution under government auspices. In Leningrad, Moscow, Kiev and other large cities parks of culture and rest have been established, equipped with playgrounds, athletic stadia and facilities for various sports. In addition a program of physical and recreational activity is offered in connection with schools, political organizations, labor unions, rest homes, sanatoria, organizations of young Communists and a great variety of other groups. Recreation is considered an integral part of a worker's life and essential to his health and physical fitness.

Until the advent of American teachers and missionaries organized community recreation in the Orient was practically unknown. In recent years, however, the governments of both Japan and China have taken steps to provide public playgrounds of the type familiar in America and have been active in educating native teachers as recreational supervisors. In the case of the Philippine Islands and Hawaii American rule

educational and recreational program in which organized play for both adults and children has a prominent place. In Turkey notable changes have occurred since the World War with regard to the public attitude toward recreation. With the emancipation of women and the extension of educational and welfare activities under the Turkish Republic, adults as well as children are participating in increased numbers in community sports and recreational activities. In April, 1930, under the auspices of Himayei Etfal (National Child Welfare Association) and the American Friends of Turkey a playground was opened in Angora designed to serve as a demonstration center and a model for the Turkish nation. In addition the Ministry of Education working in conjunction with the National Education Society has formulated a recreational program to meet the needs of adults.

Education of the public for leisure and provision of adequate community facilities for recreation constitute a question which in all countries

has taken on added seriousness with the economic depression. The enforced leisure resulting from unemployment has become one of the most urgent problems in industrial nations. It is aggravated by the fact that since 1930 there has been a decline in the expenditures for most forms of commercial amusement, an indication that increasing numbers of people who formerly relied upon commercial amusements for their entertainment are turning to public recreation, at a time when funds for its support are being curtailed. In some American cities the problem has been met by the use of unemployment relief funds for the construction of increased park and playground facilities. The scope of activities has been further enlarged by the recruitment of playground and recreation leaders from the ranks of the unemployed. This is only a temporary solution, however, and the planning of a systematic, permanent program of community recreation, based on a recognition of its social and economic importance and of the close correlation between participation in recreation and the economic level of the people, is one of the vital responsibilities of society.

RECRUITING. See MILITIA; CONSCRIPTION

RED CROSS. Of the wide flung humanitarian movements which have arisen during the past century the Red Cross is the most extensive in its reach and probably the most popular in its appeal. To its founders its present scope would

have seemed an impossible ideal. Their purpose was to ameliorate the sufferings of war, and that alone was an undertaking of great difficulty and complexity. They were by no means the first to attempt the protection of wounded soldiers. Military commanders had made agreements with one another; medical services of a kind had been instituted; a few idealists had sought to improve sanitation and to transform carelessness and ignorance into merciful competence. But the results were sporadic and unreliable. For the most part what meager medical services existed were considered a conventional part of the regular military organization and thus the rightful target of the enemy. Before reform could become widely effective the world had to be awakened to humanitarian sentiment and scientists had to be regarded as essential as soldiers.

The battle in which the French defeated the Austrians at Solferino on June 24, 1859, furnished the immediate conditions for the origin of the Red Cross. The suffering of the men on that day made a deep impression on Henri Dunant of Geneva, who was helping to care for the wounded. Three years later he published a little book, *Un souvenir de Solferino* (Geneva 1862), in which he called for official recognition of the neutrality of wounded soldiers and advocated the formation of international organizations trained in times of peace for the relief of men wounded in battle. Dunant's book aroused considerable interest, was translated into several languages and impressed particularly the Société Genevoise d'Utilité Publique. As a result of the efforts of the society a conference, attended by representatives of sixteen European states, was held in Geneva in 1863. The conference recommended that relief societies be formed in each country, to be authorized by the national governments to cooperate with the army medical services. The following year a diplomatic conference, convoked by the Swiss Federal Council, signed a convention in which the governments represented agreed to sanction the formation of relief societies, to acknowledge the neutrality of wounded men and of all persons and services engaged in their relief and to recognize the emblem of a red cross on a white ground, to be used not only by army medical services but also by official organizations assisting them. The principles of the Geneva convention were extended to naval warfare in 1899. Other diplomatic conferences, attended by delegates of the national societies and by repre-

sentatives of governments that signed the Geneva convention, have supplemented and made more explicit the provisions of the original treaty. By the end of 1864 the Geneva convention had been signed by nearly all the great European powers. The United States, occupied at the time with the Civil War and impeded later by official delays and indifference, did not sign until 1882, becoming thereby the thirty-second nation to ratify the convention. In 1930 there were fifty-seven officially recognized societies, covering practically the entire world, with a total membership of about twenty million persons. In Turkey, Egypt and part of Russia a red crescent has been substituted for the red cross, and the emblem of the Red Lion and Sun is recognized as equivalent in Persia.

The organization of the Red Cross is extremely decentralized. The International Red Cross Committee is the official central body, but it has no governing functions. Its twenty-five members, five of them honorary, are all Swiss citizens, and they serve without remuneration, assisted by a secretariat and by special delegations. Expenses, amounting to about 150,000 gold francs a year, are covered by subventions from the national societies and by the income from an inalienable capital fund. The international committee supervises a vast amount of miscellaneous research and case work. It has founded in Geneva an international institute for the study of ambulance material and has sponsored regular international meetings, including representatives of army medical services, to consider the problems of standardizing ambulance services. By means of commissions of experts and research activities it has attempted to devise ways of protecting civilians from the effects of chemical warfare, and it has also been active in the campaign for its abolition. During and after the World War the committee was concerned especially with the question of war prisoners, inaugurating visits of inspection to prison camps and administering aid to prisoners and their families. After the war the League of Nations turned to the International Red Cross Committee for the work of repatriating 650,000 prisoners of war still on enemy territory. Various legal and procedural questions which confront the Red Cross, such as communication with the citizens of a blockaded country, protection of civilians in enemy territories, administration of Red Cross relief in naval warfare and international organization of relief for disasters at sea, are also considered by the international

committee, and where necessary its recommendations are submitted to diplomatic conferences for decision. Shortly after its formation the committee began the publication of a bulletin, and in 1925 the *Annuaire de la Croix-Rouge internationale* was inaugurated. Since 1929 this has been published jointly by the committee and the League of Red Cross Societies.

The separate national societies are entirely free in their organization and administration, but each of them, whatever its internal organization, is headed by a central committee which represents it in all its international relations. There are a few principles enunciated by the international committee to which all subsidiary societies must conform. In any country there can be only one official Red Cross society; this society must be recognized by its government as an auxiliary to the army medical service and its government must have accepted the Geneva convention; membership must be open to all nationals, without discrimination as to sex, religion or political opinion; the scope of its activity must include the entire national territory and must embrace all appropriate aspects of military medical service.

The work of the Red Cross during the World War brought it dramatically to the focus of public attention. Membership, contributions and enthusiasm for its program increased so greatly that it took on the nature of a public trust; and when active hostilities were over, its services were found to be even more essential than before. Starving, disease ridden populations needed supplies and care; disabled men needed homes and training; regions devastated by the war and torn by civil strife needed help as sorely as had the forces in international conflict. Even before the war the necessity of Red Cross services in peace time had been discussed and some societies, especially the American, had extended their activities to include relief in time of disaster. But now the abstract principle was vitalized by urgent demands. Henry P. Davison, the chairman of the war council of the American Red Cross, led the way in forming an organization to cope with the situation. Early in 1919 a committee of representatives from the Red Cross societies of France, Great Britain, Italy, Japan and the United States was formed to consider plans, and on May 5, 1919, the League of Red Cross Societies was set up in Paris. All national societies are eligible for membership in the league, but their affiliation is entirely voluntary. By 1930, when the

Turkish Red Crescent became a member, all the national societies had joined. The purpose of the league is to afford a central organization for the humanitarian activities, both national and international, of the Red Cross in times of peace, and one of its fundamental principles is absolute freedom from political and religious discrimination. Its expenses are met by voluntary contributions from the constituent societies. The league cooperates with the International Red Cross Committee, especially in the administration of relief work, and also maintains close relations with other welfare organizations.

The relief division of the league was formed in 1924 to organize and coordinate Red Cross activities in this field and to serve as a bureau for research and information. In times of famine, epidemics, cyclones, earthquakes and floods, the Red Cross has proved such a reliable instrument for prompt and effective assistance that its service in disaster relief has developed into one of its most important functions. In 1921 Senator Giovanni Ciraolo, honorary president of the Italian Red Cross, suggested the formation of a federation for the administration of international disaster relief. The projected International Relief Union would provide for the coordination of all relief agencies in times of international disaster. While the national Red Cross societies would not necessarily be the representatives of their respective governments in the union, they undoubtedly would fulfil this function in many cases; and in any event the Red Cross, which has so distinguished itself in this work, would have an essential position in administration and execution. Under the auspices of the League of Nations a convention providing for such an organization was signed by thirty governments in 1927. It will become effective when ratified by twelve governments and when the subscription of 420,000 gold francs has been guaranteed.

In the field of public health the League of Red Cross Societies cooperates with existing institutions and serves as a center for information and propaganda. It publishes *World's Health*, a quarterly review in English, French and Spanish, and also a monthly *Information Bulletin*. It maintains a close relationship with the public health organizations of the League of Nations. A Nursing Division was formed in 1919, which advises the national societies in problems concerning the training and activities of nurses. Two international courses designed

to meet the needs of Red Cross nursing have been established in London.

About three fourths of the national societies have regular provisions for children's membership, and the League of Red Cross Societies maintains a separate Junior Division to coordinate this work. The Junior Red Cross teaches school children the elements of healthful living and attempts to inculcate in them a sense of civic responsibility. In a majority of the countries which have a Junior Red Cross special children's magazines are published. There are over eleven million junior members in the various Red Cross societies; nearly seven million are in the United States and there are another million or more in Japan.

In the 1920's there was a growing conviction that some kind of central supervisory body was needed to coordinate representatives of the various organizations of the Red Cross. For this purpose an agreement was reached in 1928 to institute an International Red Cross Conference, which should be the supreme deliberative body of the International Red Cross, composed of the International Red Cross Committee, the national societies and the League of Red Cross Societies. It was decided that the conference would meet every four years, at shorter intervals when desirable, and would be convoked by the central committee of a national society, by the international committee or by the league. By this means the single, loosely connected societies have become united in an international federation, which will give them the benefit of inter-relationship without in any way impairing their independence.

Some notion of the extent and financial importance of Red Cross peacetime activities may be gained from a survey of the expenditures on disaster relief by the American Red Cross Society between the years 1881 and 1931. During this period a total of over \$94,000,000 was spent for the relief and rehabilitation of victims of more than a thousand disasters in the United States and abroad. Conspicuous among them were the following: San Francisco earthquake and fire (1906), \$9,720,131; Messina earthquake in Sicily (1908), \$1,012,000; Ohio River valley floods (1913), \$2,472,287; influenza epidemic (1918), \$1,680,000; Chinese famine (1920-21), \$1,234,696; Japanese earthquake (1923), \$11,768,802; Florida hurricane (1926), \$4,485,604; Mississippi River floods (1927), \$17,498,902; West Indies hurricane (1928), \$5,933,726; United States drought (1930-31), \$10,894,836.

Since the beginning of the economic depression in 1929 the program of the Red Cross has been extended to include unemployment relief, particularly in rural communities and small towns devoid of other organized welfare agencies. By acts of Congress in 1932 the Red Cross was authorized to distribute a total of 85,000,000 bushels of government owned wheat to needy families in the United States and its territories. In 1932 and 1933 Congress assigned 844,000 bales of cotton to the Red Cross for the same purpose. The conversion of this raw material into flour and clothing and the administrative costs involved in the distribution to over 25,000,000 beneficiaries entailed an outlay of \$735,000 on the part of the Red Cross.

The World War of course marked a high point in Red Cross expenditures in both neutral and belligerent states. Exact statistics are difficult to obtain because of the diversity of activities undertaken by the Red Cross and the overlapping or coordination in certain types of service with other social and welfare agencies. The record of the American Red Cross is, however, indicated in reports compiled shortly after the close of the war. In addition to \$28,978,000 spent in the United States the American society extended war relief to twenty-five foreign countries, disbursing a total of over \$120,000,000. Chief among these countries with approximate expenditures for each were: France \$57,207,003; Belgium, \$3,875,161; Italy, \$11,972,819; British Isles, \$11,267,304; Switzerland, \$5,972,777; Russia, \$2,240,167; Siberia, \$8,225,769; Balkan countries, \$4,569,868; Palestine and the Near East, \$8,320,211.

Equally impressive was the contribution of the British Red Cross Society, which, working in conjunction with the Order of St. John of Jerusalem, reported a war relief expenditure of more than £20,000,000 between October 20, 1914, and June 30, 1920. This figure, which is exclusive of the separate amounts spent by each society between August 4 and October 20, 1914, comprised funds for the provision of hospitals, medical and surgical equipment, transportation of the wounded, inquiries for injured and missing men, services in connection with prisoners of war and grants toward the aftercare of sick and disabled ex-service men. British Red Cross activities were extended to Egypt, the Balkan countries and Russia as well as to France and Belgium. Mention should be made also of the operations of the other Red Cross societies within the British dominions, especially those of

Canada, Australia and South Africa. These organizations, although nominally branches of the British Red Cross, functioned as separate units with respect to their activities, revenues and expenditures.

Funds for the support of Red Cross societies are in most countries derived from membership fees and from popular subscriptions. In 1906 the American Red Cross had 9262 members and in May, 1917, immediately after the United States entered the war, it had nearly 500,000 adult members. Before the year was over membership had increased to 22,000,000 and toward the end of the war it reached a total of 35,000,000, or approximately one third of the population of the country. There are various classes of membership ranging from the payment of one dollar annually to one hundred dollars. Money realized through certain of these types of membership is set aside as a national endowment, while the remainder is utilized for current requirements. With the lessening demands made upon the Red Cross for war and post-war activities, membership in the majority of countries declined during the decade following the World War, a reduction which was of course accelerated by the economic depression beginning in 1929. In that year the American Red Cross reported slightly more than 11,000,000 members, including adults and children. In Japan the figure was approximately 4,000,000. The Italian and German Red Cross societies had memberships of over 1,000,000 and a dozen other societies reported more than 100,000 members each.

In time of war, disaster or other emergency popular subscriptions are usually called for to finance Red Cross undertakings. In the United States these are often given official endorsement through proclamation by the president, who also serves as president of the Red Cross. In a few instances local governmental aid has been made available for Red Cross activities. After the Ohio River floods of 1913, for example, the Ohio legislature appropriated \$250,000 for flood relief and entrusted its administration to the Red Cross. Federal assistance usually comprises the provision of services, such as transportation and communication facilities in time of disaster and the furnishing of equipment, tents, cots, blankets and other emergency supplies. In certain metropolitan centers, notably Cleveland, the local branch or chapter of the Red Cross is a member of the community chest through which funds are obtained for the support of welfare organizations throughout the city and county

During the World War, in addition to the regular annual membership roll calls, two special drives were held to raise funds for Red Cross activities. The first appeal made in 1917 for \$100,000,000 was oversubscribed by nearly \$15,000,000; a second drive the following year for \$100,000,000 resulted in a total subscription of \$182,000,000. Altogether, through membership campaigns and special emergency appeals, the American Red Cross collected nearly \$400,000,000 to carry on its war activities.

In England more than £20,000,000 was raised for the Red Cross war work, which included some £17,000,000 realized through donations, organized collections and gifts of supplies and approximately £618,000 in government grants. The campaign for Red Cross contributions was conducted largely under the auspices of the *London Times*, which for over four years opened its columns to the society's propaganda and supervised the collection of funds.

REEVES, WILLIAM PEMBER (1857-1932), British statesman and social economist. Reeves was born in New Zealand; after studying for the bar he turned to journalistic activities and later to politics. Both as a practical politician and as a descriptive writer he was the leading exponent of the state socialism of New Zealand. His socialism was drawn partly from his study of utopian experiments, which he described in *Some Historical Articles on Communism and Socialism* (Christchurch 1890). It was based even more upon the empirical necessities of a young country: in the 1880's New Zealand was suffering a severe depression, aggravated by land monopoly, unregulated immigration and the aftermath of a borrowing boom; and unemployment, low wages, sweatshops and labor abuses were rife. Reeves entered the New Zealand Parliament in 1887, in 1891 became minister of education and justice and the following year minister of labor in the newly formed Liberal-Labour cabinet. He was instrumental in shaping the experimental legislation of the period both in its general trend toward state socialism and in the various specific measures which resulted in the building up of a most comprehensive and effective labor code. The most discussed item in this code, establishing the system of compulsory arbitration, was introduced by Reeves in 1894.

From 1896, when he went to London as agent general, Reeves resided in England. In 1898 he published *The Long White Cloud* (London, 3rd ed. 1924) and in 1902 *State Experiments in Australia and New Zealand* (2 vols., London). He was active also in the Fabian Society and wrote several of its early tracts during the period in which the apparent success of the state socialist experiments in New Zealand exercised considerable influence upon the development of socialist thought in England. In 1908 he became director of the London School of Economics and Political Science, a position which he retained until 1919; his main influence was in the broadening of teaching and research, especially in applied economics, and the closer interrelation of the various social sciences. In 1917 he became chairman of the directors of the National Bank

of New Zealand, and gave his entire time to this enterprise from 1919 until his death.

REFERENDUM. *See* INITIATIVE AND REFERENDUM.

REFORMATION

LUTHERAN. In many respects the Reformation may be said to mark the beginning of a new era in the history of the European church and of European culture in general. It destroyed the monopoly of the mediaeval ecclesiastical hierarchy headed by the pope at Rome (*see* RELIGIOUS INSTITUTIONS, CHRISTIAN, section on ROMAN CATHOLIC; PAPACY) and thereby reduced the Catholic church to the comparatively modest status of one among many confessions (*see* RELIGIOUS INSTITUTIONS, CHRISTIAN, section on PROTESTANT; PROTESTANTISM). But at the same time it should be emphasized that in its attack on Roman papalism and traditional church institutions the Reformation constitutes in a very real sense the climax and convergence of a number of older forces which may be traced far back into the Middle Ages. For many generations there had been groups, clerical as well as secular, which were antagonistic to the system of ecclesiastical centralization dominated by the papal Curia and outspoken in their opposition to the extravagant claims of the Roman popes.

During the bitter fight between church and state which had flared up intermittently throughout the Middle Ages from the time of Henry II to Louis of Bavaria, the German emperors, as professed heirs of the Caesars and as exponents of the ambitious doctrines of Caesaropapism, had repeatedly challenged the theory of Roman supremacy expounded by the popes. A long line of publicists in the service of the various emperors had not only helped to weaken the faith of many believers as to the omnipotence of the pope but had served, even after the dwindling of imperial power in the fourteenth century, to keep alive the tradition of an "Emperor-Redeemer," who should assume his rightful place as spiritual and temporal leader of the universe. The significance of this imperial, antipapal tradition as a factor in preparing the way for the Reformation is indicated by the fact that when in 1519, on the death of

Maximilian I, his grandson Charles V ascended the throne with the declared intent of reasserting and reestablishing imperial primacy, he was overwhelmingly acclaimed by those insurgent groups which sought to reform the abuses arising out of excessive papalism. In his inaugural *Wahlkapitulation* he pledged that no German should be delivered over to the Roman tribunal without first being tried in Germany—a pledge which allowed Luther to stand trial in his native land. Although subsequently Charles himself proved to be a vigorous if unavailing antagonist of the Reformation movement in its later stages, the subversive forces of antipapalism and anti-Romanism in Germany drew strength from the traditional associations clustering around his office as Germanic head of the Christian world.

In drawing up his epoch making manifesto of 1520, *On the Christian Nobility of the German Nation*, Luther not only invoked the sentiments of German nationalism aroused by Charles' recent accession but also built upon a tradition which inside the church itself had for more than a century been combating with increasing vigor the claims of the popes to unqualified supremacy. The conciliar ideal of rooting out papal abuses had continued to inspire various schools of ecclesiastical reformers long after the leaders of the conciliar movement (*q.v.*) proper had been manoeuvred into compromising with the forces of papalism. The desirability of convoking a free council was advanced in nearly all the pamphlets and tracts of the fifteenth century and there was prolific argument as to whether the new council should be summoned by the emperor or by the pope, whether its personnel should include laymen and whether it should aim merely at correction of manners or at a reconstitution of the entire church.

Similarly the autonomous national church, which has frequently been pointed to as the particular creation of the Reformation, traces its origins to the later mediaeval period. As a means of repressing the democratic and regionalistic forces within the church the popes of the fifteenth century had entered into a number of concordats with the various national monarchies. Their main purpose was achieved but at the same time the new arrangement served to bring ecclesiastical institutions under the sway of the newly consolidated temporal powers. As the prince assumed ever greater control over the monasteries and churches in his realm, imposing heavy contributions and nominating bishops and priests, the framework of a purely national

church, independent of the pope, began to emerge. This national church therefore was essentially a mediaeval creation and merely supplied one of the foundations for the Reformation.

The Reformation movement in the towns likewise conformed to older patterns, particularly in respect to social alignments. For at least a century there had been developing an antagonism between the patricians and the commune, which was generally organized into guilds of handicraftsmen; in other words, between the conservative financial interests and the democratic artisanry. This social and economic alignment was paralleled by a cleavage between cleric and layman. With practically no exceptions the Reformation recruited its adherents from the guilds and the laymen, while the forces supporting the ecclesiastical status quo were concentrated to a very large degree in the aristocracy of wealth and the priesthood. In Basel, Münster, Constance, Strasbourg and other metropolitan seats the Reformation finally effected a solution of the old struggle over the rights and privileges of the burghers. The administrative organization adopted in the Reformation towns followed a more or less uniform pattern: at the head a magistrate; assisted by Protestant ministers who were intent upon checking magisterial arbitrariness and upon preserving the rights of the church; and, finally, charitable works to prevent poverty and beggary. The truth of the popular mediaeval saying, "Urban air is free air," drew into the tolerant atmosphere of the towns such freethinkers and nonconformists as Sebastian Franck, Kaspar von Schwenkfeld and David Joris.

In any analysis of the forces which were preparing the way for the Reformation considerable weight must be given to the piety prevailing among the masses of the people. When measured by popular standards of devoutness, the immorality, the mercenary greed and above all the hypocrisy of large numbers of priests seemed particularly unforgivable. "Once we meet God face to face we shall lament to Him that we are not permitted to kill the parson," sang the troop of pilgrims at Niklashausen on Tauber. But the widely current image of a papal Antichrist, wallowing in luxury and debauchery at Rome and draining the resources of the faithful, aroused such hatred on the part of the people against the head of the ecclesiastical system that the shortcomings of his priestly subordinates seemed comparatively trivial. Here again, how-

ever, the Reformation in revolting against the decadent luxury of the papal Curia and in pointing out by way of contrast the purity of the primitive Christian church was essentially a continuation of certain older currents in the mediaeval church. The Amalricians, the Joachimites, the Waldenses and numerous other heresies during the Middle Ages had deplored the abandonment by the pope of the ways of apostolic simplicity and Biblical purity and dreamed of a return to the golden age of the church as it was supposed to have existed in the days before Constantine, allegedly, had corrupted the papacy by endowing it with territorial holdings. Even in mediaeval monastic communities, such as the Brethren of the Common Life, the Beguines and Beghards and the Bursfeldian congregation, which did not reach the stage of open heresy, piety, free from materialistic greed, was zealously cultivated. In the more abstract field of dogmatic theology the rationalism of the Thomist realists had gradually been leavened with the postulates of the nominalists—so familiar later to Luther—as to the awe inspiring holiness of a divine will which man in his separate earthly sphere could glimpse only through revelation. For many generations in fact the Catholic church had been troubled in spirit, and the soil of the Christian faith was ready for a new sowing.

Although the Reformation may thus be said to have carried to completion the ecclesiastical and theological work of the mediaeval insurgents, it was also heavily conditioned by the new cultural and economic forces which were rapidly ushering in the modern system of capitalism. The transformation of natural economy, the expansion of commerce, the discovery of unknown lands, had generated a new mobility in the economic sphere. The great banking houses of Fugger and Welser were taking the lead in accumulating capital wealth. A new and more energetic way of life was introduced, which even when not explicitly antipathetic to the church was on the whole indifferent to ecclesiastical problems. Flourishing schools grew up in the towns, and in the higher spheres of thought and creative art the humanist scholars and the painters of the Renaissance were evolving a culture which by recapturing the spirit of pagan antiquity sought to restore man to a more central place in the universe. The scholarly researches no less than the general temper of the Renaissance humanists exerted a marked influence on the ideology and program of the Refor-

mation. Erasmus' translation of the New Testament (1516), conceived as both a philological work and a document of moral reform, proved an invaluable aid to Luther and other Reformation leaders, who in general drew upon the editorial and exegetic work of the scholars. Furthermore with the spread of a scientific outlook the increasing heterogeneity of religious beliefs began to be accepted as the natural process whereby the one divine Logos revealed itself in manifold forms. This type of humanist tolerance spread it not to Luther himself at least to such freethinkers as Melancthon, Zwingli, Hutten and Franck as well as to the Anabaptists and the Socinians.

But however great a role broader historical and cultural developments may have played in preparing the way for the Reformation, the purely individual and spiritual factors as personified in the restless monk of Wittenberg must be recognized as the immediately detonative force. Luther's emphasis on justification by faith alone contained, to be sure, numerous implications as to the proper regulation of state, church and society; but Luther himself, confronted throughout his active career with an ever shifting set of problems, was in no position to work out these implications systematically. In the main it was left to his adversaries to trace the ultimate consequences of his thought. Thus, although it clung consistently to a few basic essentials, such as free preaching of the gospel of justification by faith and the holding of sacraments in the manner prescribed by Christ Himself, the Lutheran Reformation, in striking contrast to the Calvinist, was essentially a process of flexible adaptation to new situations as they arose.

In 1517 Luther published his ninety-seven theses repudiating the mediaeval sacrament of penitence and the sale of indulgences as practised by the representatives of the pope. In 1519 in the course of the Leipzig controversy with Eck he denied the *jus divinum* of the papacy as well as the infallibility of conciliar decrees and proclaimed as the only true authority Holy Scripture interpreted by faith. In 1520, stimulated by the outburst of national enthusiasm for the new emperor, he issued his famous manifesto *On the Christian Nobility of the German Nation*, which sketched a comprehensive agenda to be taken up by a free council composed of princes and laymen and presided over by the emperor. As spokesman of the German nation he protested against the tyranny of pope, cardi-

nals and bishops, against the superstition of the people as manifested in pilgrimages and veneration of relics and against the celibacy of priests. He called upon the civil power to assume responsibility for prohibiting luxury, brothels and usury and upon the towns to set up boards of charity.

But the most far reaching and influential of his utterances was the strictly religious proclamation as to the universal priesthood of all true believers. In view of the fact that in the Catholic church all avenues of salvation are controlled by the priest, the elimination of a professional priesthood, as Luther recommended, implied the end of the Church itself. At an earlier stage Wycliffe had championed the ideal of a priestless church, but he had been unable to transform this ideal into reality. Luther, however, ruling out the conventional forms of mediation between God and man, succeeded in establishing the autonomous parish with a vicar elected and if necessary deposed by the parishioners. On December 10, 1520, Luther, in the act of burning the papal bull of excommunication and the books of canon law, broke categorically with the mediaeval church. In the course of his trial the following year at the Diet of Worms he pleaded for the rights of the individual conscience as against all human authorities; and although he himself repeatedly emphasized that this liberty of conscience was to operate only within the limits of the truth as contained in the Scriptures, a great stride had been made toward genuine freedom of belief.

By 1525 the attempt of the fourth estate to use the ideology and dynamic of the Reformation as a means of improving its own social and economic fortunes had come to a head in the Peasants' War. Although the Reformation cannot be said to have caused this revolt, it was beyond doubt a contributing factor, as can be seen from the change undergone by the peasants' program after the outbreak of the Reformation. Their later insistence on free election of vicars, freedom from taxation, free fishing, free forest and pasture in the name of Christ the Redeemer, was in part a reflection of Luther's teaching and in part a misreading of the new religious formula, "freedom of the Christian individual." Luther had defined religious liberty as the mastery of the true Christian over all things; the peasants interpreted this definition as implying that they were no longer compelled to perform the services imposed by clerical and lay landlords. In the early days of the revolt Luther,

although deploring this confusion of religious and economic issues, was anxious for a peaceful solution and therefore urged the landlords to remedy the abuses cited by the peasants in their Twelve Articles of grievance. But once the peasants had resorted to violence and arson, he issued his vehement pamphlet *Against the Thieving and Murderous Bands of Peasants*, which authorized the magistrates to use whatever force might be necessary in subduing the rioters. Luther was not inclined to be subservient to princes, but he exacted strict obedience to those in authority, both in this world and in the next.

The rapid spread of the Reformation movement throughout Germany in the period after 1525 may be attributed in large part to the contagiousness of a new and dynamic religious enthusiasm and faith. But at the same time it was forwarded by incidental factors of a more negative and secular character. In the first place, the emperor Charles V, who as claimant of universal supremacy in the spiritual as well as the temporal spheres would naturally be opposed to a radically regionalistic movement within the church, was preoccupied during the early years of his reign with international and domestic complications of a strictly political and diplomatic nature. It was not until the 1540's that he was in a position to concentrate on stamping out the forces of religious heresy in the German sections of his extensive empire, and by that time the Reformation movement had taken such firm hold that he was powerless to eradicate it. Similarly, although for a different reason, the princely electors who headed the various *Länder* in Germany could offer but feeble resistance to the subversive forces of insurrection. In the great majority of cases the territorial prince was at the mercy of his estates, which controlled the territorial finances and used this control as a means of enforcing their demands for thoroughgoing ecclesiastical reform. This antagonism between the regional prince and the regional estates was in fact one of the most powerful factors contributing to the progress of the Reformation. Even when the entire machinery of the Holy Roman Empire was brought into play, as in the case of the diets, the standing orders were so stilted and involved that there was almost invariably a fatal delay in their execution. As a result the diets of Worms, Nuremberg, Augsburg, Regensburg and the others which punctuated the Reformation movement were more in the nature of breathing spells than

effective agencies of compromise and pacification.

The organization of territorial churches, as provided by the Diet of Speyer in 1526, was carried out by Philip of Hesse, who likewise served as head of the political league of Protestants set up by the Second Diet of Speyer three years later. At the Diet of Augsburg in 1530 the Lutherans drew up their first confession. Following the defeat of the Schmalkalden the Peace of Augsburg in 1555 transferred the *jus reformandi* to the sovereigns, who pronounced themselves adherents of the Augsburg Confession of 1530. Henceforth the principle of *cujus regio ejus religio* left the matter of religious control to the discretion of the regional princes. Although as a result of the Peace of Münster and Osnabrück in 1648 Lutherans, Calvinists and Catholics were eligible for toleration, the more spiritualistic religious sects, such as the Anabaptists, were excluded, chiefly on the ground of their belief in free will.

The chief centers of Lutheranism in Germany were Saxony in the north, Hesse in the center, Nuremberg in the southeast and Württemberg in the southwest. Outside Germany Lutheranism gained its strongest foothold in Denmark, Sweden and Norway, among the German population of Hungary, Transylvania, Carniola, Corinthia and Styria and in the German towns in Poland and along the Baltic. It also recruited a following among many groups in Bohemia and to a far less degree in France and England, where it was overshadowed by other types of reform movements.

As a result of the Counter-Reformation, which under the leadership of the reform papacy (*q.v.*) succeeded to a large extent in eradicating many of the extreme abuses prevailing in the later mediaeval church (*see* RELIGIOUS INSTITUTIONS, CHRISTIAN, section on ROMAN CATHOLIC), a number of German territories, notably the Palatinate-Neuburg, the Palatinate superior and the margraviate of Baden were recatholicized. Other territories, such as Bavaria under the Wittelsbachers and Austria under the Hapsburgs, which had stood out against the forces of the Reformation, cooperated fully in the strenuous counteroffensive directed by a variety of newly created ecclesiastical agencies and religious orders (*q.v.*) under the leadership of the Jesuits (*q.v.*). Although the Counter-Reformation in Germany was in the nature of the situation much less concentrated than the analogous movements in Spain and the Netherlands under

Philip II, in France under the Guises or in England under Mary Tudor and Scotland under Mary Stuart, the work of such Catholic reformers as Julius Echter von Mespelbrunn, founder of the University of Würzburg, Cardinal Truchsess von Waldburg at Augsburg, Balthazar von Dernbach at Fulde and Stanislaus Hosius at Ermland went a considerable distance toward restoring in modified form Catholic cult and institutions.

W. KÖHLER

NON-LUTHERAN. While the forces leading to the non-Lutheran Reformation movements were in general the same as those operative in Germany and Scandinavia, their configuration differed from country to country. Regional variations in the character of existing institutions and modes of life, in the quality of leadership and group initiative, in relations to the Roman See, in the rate of economic change and in the chronological order in which the movements manifested themselves gave a particular stamp to the Reformation in each of the countries.

Next to Germany, Switzerland soon came to be the main fountainhead of reform. The sources of the Swiss movement lay first of all in the effort to establish and safeguard independence from the empire or from foreign rule; in the democratic spirit and constitutions of the commercial towns, especially Zurich and Geneva; in the conflict of municipal with episcopal authority over the control of the church; and in humanism. The Helvetic Reformation began in the imperial, guild governed and commercial town of Zurich, which since 1483 had become both increasingly democratic in constitution and increasingly powerful over ecclesiastical affairs in its jurisdiction. Zwingli, a patriotic priest, gave new vigor to the movement thus begun, first under humanist and later more under Lutheran auspices. His reforms were directed first of all against indulgences, non-voluntary tithes, the episcopal government of the church, the ornateness of worship and the mercenary Swiss military policy. Opposition to the papacy and the clergy, to monasticism, to confession and invocation of saints and finally to the mass and the use of images and music in the churches gradually developed, while upon the positive side the function of preaching was exalted and the sole authority of the Bible maintained. Yet the reform was political and social in the first instance and had less the character of a revival of religion than had been the case in the Lutheran

areas. The overt break between Luther and Zwingli on the subject of the sacrament was indicative of deeper causes of division: of the democratic and nationalist nature of the Swiss reform on the one hand and of its humanism on the other. Yet Zwingli's relations with the Anabaptist and peasant movements were analogous to those of Luther.

The Reformation in Geneva, although similar in its origins, was destined to become far more important than the Zwinglian movement in Zurich. The constellation of social forces was similar: the movement began with the assumption of power over the church by the council in opposition to a bishop of Italian nationality and with a protest against clerical abuses and ecclesiastical wealth; it proceeded to a second stage, namely, the simplification and popularization of worship and the rejection of hierarchy, mass and monasticism. Moreover in both centers the Reformation drew its primary support from the commercial classes, the country cantons remaining Catholic, and resisted the Anabaptist attempts at separation of church and state and radical reform of economic and political life. The differences which developed were largely due to the leader of the reform in Geneva, Calvin, who combined with humanist training and interests a more profound religious and moral passion as well as legal and governing ability. Far closer to Luther than Zwingli had been in his conception of the Christian life as based upon salvation by faith and the election of God, far more deeply stirred by the Bible and the deterministic doctrine of divine sovereignty, Calvin directed his reforms not so much toward the elimination of abuses and the substitution of state for hierarchical control as toward the positive program of developing a holy community. The early negative steps toward reformation had been taken by the citizens of Geneva under various leaders prior to the arrival of Calvin. With his advent and as a result of his activity civic government of the church was practically replaced by a theocracy in which the ministers or presbyters became the rulers of the state. Calvin gave precision and form to the theocratic rule through the measures which he adopted in the organization of church and state and through the highly logical and incisive development of his system of thought in the *Institutes of the Christian Religion*, a book which more than any other became the definitive guide of the churches of the Reformation.

The theocratic rule in Geneva was directed

particularly toward the reform of manners and morals not only of priests and monastics but of the people in general; and although Calvin was unrelenting in his attacks on the Catholic church, his energy was devoted more to the positive task of organizing Protestantism than toward that of destroying Catholicism. As a second generation reformer he carried on the work for which Luther, Zwingli and their associates had laid the foundations. By reason of its relation to the municipal government and its fear of the abuses to which unchecked power might lead the Calvinist reform allowed for a certain degree of popular participation in government, but on the whole it subordinated liberty to a strict principle of authoritarianism. Its rigid rule was extended over the sphere of economic affairs, where it was probably more effective, during Calvin's lifetime at least, than Catholicism had been. In many respects, however, particularly in its antagonism to luxury, its demand for thrift and diligence, its exaltation of secular work as divine vocation and its recognition, however grudging, of the principle of usury, it represented the interests of the commercial classes of Geneva, who were its primary supporters. And after the death of Calvin in 1564 these interests contributed to the gradual modification of the extreme authoritarianism of the theocratic regime.

In contrast to Lutheranism, whose permanent influence was limited in the main to Germany and Scandinavia, Calvinism became increasingly significant in the reform movements of other European countries, particularly of France, the Netherlands, Scotland and England. In France one aspect of the Reformation had been anticipated in the Pragmatic Sanction of 1438 and in the Concordat of 1516, which together gave to the French king a power over the church and a share in its wealth which German and English princes and Swiss cities gained only by means of separation from Catholicism. As a humanistic and individualistic movement, however, the Reformation in France began with the writings and preaching of Lefèvre and the growth of popular interest in the Scriptures. After 1536 under the leadership of Calvin, who remained constantly in close touch with the French Protestants, it took on a more definitely Protestant content. With some minor vacillations, which may be attributed in the main to shifts in foreign policy, the monarchy was vigorous in its prosecution of Protestantism. Yet the movement gained adherents throughout France, particularly in the

commercial cities and among the artisans; and after the middle of the century Protestant churches, organized on the presbyterian plan, were established in many places. The increasing adherence of members of the nobility to Protestantism was greatly expedited after the death of Henry II (1559) and the passing of the absolute monarchy into the hands of unpopular regents. During the next forty years Protestantism was involved in the succession of civil wars, which while nominally wars of religion were largely dynastic and social in character. Thanks to the terms of the Concordat of 1516 Francis I and most of his successors remained loyal Catholics. The masses of peasants, who as usual identified their interests with the king, did not offer a congenial soil for the growth of the Reformation movement. As a result Protestantism in France, although well represented among the feudal nobility and the bourgeoisie, never became a popular movement, since the former group was declining in power and the latter was never sufficiently strong at this period to exert a decisive influence.

The salient features in the social background of the Reformation in the Netherlands were the struggle of the feudal nobility with the monarchical absolutism of Charles V and Philip II, the rise of a strong middle class in towns which had become the commercial capitals of sixteenth century Europe, the efforts of the guilds to maintain their ancient privileges in the face of monarch and rising capitalist, the tendency toward the national unification of independent provinces, insistence upon home rule and revolutionary temper on the part of the poor. The humanism of Erasmus inaugurated the Reformation, for which the mediaeval Brethren of the Common Life with their mysticism and work in popular education had prepared the ground. The Dutch towns, being closely related to Germany by commerce and language, were so receptive of Lutheran ideas that by 1527 two thirds of the population were said to "keep Luther's opinions." Persecution was constant, but no open resistance developed until the Anabaptists, combining political and economic with religious ideas, attracted many among the lower classes and rose in revolt. After their sanguinary defeat this movement was guided into pacifist and sectarian channels by Menno Simons.

Lutheranism and Anabaptism were succeeded by Calvinism. Its dissemination in the Netherlands, coinciding with the abdication of Charles V and the accession of the Spanish Philip II, was

forwarded by the growing antagonism of the people to foreign rule and increase in taxation. Because of its readiness to resist aggression, its principle of organization and its attraction of middle class groups which had been untouched either by Lutheranism or by Anabaptism, Calvinism developed a strength which the other Protestant movements had lacked. The war which ensued had the combined characteristics of a war of independence, a civil war waged in the interests of constitutional and republican government and of national unity, and a religious war. The lines of cleavage varied: large sections of Catholicism supported the war for independence, but on the whole the Protestant, middle class and urban, nationalistic and republican interests coincided, while leadership came from a few families of the nobility. Calvinism was as much the source of the political and economic movements as it was their reflection. In the final result the Netherlands were divided into the northern, independent, Protestant and semi-republican United Provinces and the southern, Catholic, Spanish Netherlands, which had also gained autonomy although dynastically they were united with Spain.

The progress of the Reformation in England was due primarily to more obviously political interests. The separation of the Church of England from Rome under Henry VIII was not dissimilar to the separation of the Gallican church, which had remained Catholic in doctrine and ritual. Political and economic interests played the chief role; the separation was part of the program of political absolutism whereby both the influence and the wealth of the church were put at the disposal of the monarch. The Reformation as a religious movement was too slight in sixteenth century England to force upon the separated church a decisively Protestant character. Nevertheless, Protestant ideas penetrated not only into the ranks of the clergy but also into the urban and merchant groups on whose support the programs of Henry and Elizabeth were forced to rely, while under the weak regencies which ruled for Edward VI these groups exercised an even larger influence. As a result the doctrines and rites of the separated English church reflected, while they did not wholly represent, the current Protestant ideas and practices. The coincidence of the Catholic reaction under Mary with a foreign policy which seemed to subordinate England to Spain identified Protestantism more than ever with nationalism, while the Protestant use of the native language,

particularly in the Scriptures and the *Book of Common Prayer*, associated the religious movement with the rise of the national culture. On the whole therefore religious interests were secondary to political and national interests in the sixteenth century Reformation in England. The religious revival and the middle class revolt against political and ecclesiastical absolutism appeared much later and combined forces in the Puritan and parliamentary movement (see PURITANISM).

In Scotland, on the other hand, the Reformation appeared as a reaction not so much against the papacy as against the local Catholic churches and their priests, while Calvinist ideas of divine sovereignty, Biblical authority and the decisive importance of the Protestant doctrines for eternal salvation were effective at an early stage. On its political side the Scottish Reformation represented the desire for national self-determination against France and England rather than against the papacy, and this phase of the movement was carried on not under the auspices of an absolute monarch but under those of the lower nobility and of the merchants. The weakness of the monarchs and their dependence upon foreign support, the strength of the Protestant leader John Knox, imbued with Calvinist doctrines and bearer of the Calvinist system of organization, were of primary importance in the development of the highly Protestant character of the Scottish church.

Although it is difficult to summarize a movement so diverse as the Reformation, it is evident that its results were fairly consistent despite individual differences in the various areas. One consequence was the redistribution of power to the monarchy and the bourgeoisie, at the expense of the feudal nobility and the priestly hierarchy associated with it. Another common product of the movement was the establishment of political, religious and cultural autonomy in the various sections of Europe, even in regions, such as France and Belgium, where the Protestant religion did not come to prevail. Furthermore the Reformation broke up the mediaeval system of authority, for although it supplanted the old authorities with new ones, the latter were in principle pluralistic and unable to claim for themselves in the long run the rights which unified authority is capable of demanding and establishing. Moreover the Reformation by its doctrine of the Scriptures inclined political and religious societies strongly in the direction of constitutionalism and opened the way to the

principle of individual experience or reason as the necessary concomitant authority. Redistribution of wealth through the acquisition by courtiers and middle classes of the church properties, the relaxation of mediaeval restrictions on banking and trade, which had a moral rather than a direct effect, and the Protestant doctrine of vocation contributed considerably to the rise of modern capitalism. In these respects chiefly the Reformation laid the bases of the modern nationalistic, democratic and capitalistic cultures.

REFORMATORIES. See PENAL INSTITUTIONS.

REFORMISM is the name for an attitude characterized by the belief that the improvement or the salvation of the social order, or both, can be accomplished through the alteration of some particular institution, activity or condition. Reformers may be, in their general social attitudes, either conservatives or liberals but they are not exponents of reformism unless they hold that some limited and specific rectification or betterment or restoration of a social structure or associative relation will bring about a general improvement of society.

The reformer operates on parts where the revolutionist operates on wholes. The reformer seeks modifications harmonious with existing trends and consistent with prevailing principles and movements. The revolutionist seeks re-direction of trends, arrest or reversal of movements and mutation of principles. To the reformer the status quo is essentially healthy but a little out of gear in this spot or that. To the revolutionist the status quo is unhealthy and no part of it is good. Both reformer and revolutionist differ from the liberal in that they are concerned with complete and cataclysmal changes; the one in some determinate item, the other in the social whole. To the liberal, social change proceeds continuously, from next to

next. Its tempo varies, and its consequences are definite though gradual alterations of the institutional forms which together compose society. Since the liberal looks upon society as a historical and mobile growth, he regards the processes and means of change as more important than the results of change. But to the reformer and the revolutionist, society is essentially structural rather than confluent; and they regard the social order as a necessary pattern, composed of parts, each and all of which may be more or less successfully set up, remodeled and maintained. Reformers seek the construction of the patterns necessary to the right form for this or that situation. So, such a concept as ballot reform assumes that manhood suffrage is right, that there is a necessarily correct way of exercising the right to vote, and seeks to define and to implement this correct way. The steps leading to the ordination of the Australian ballot, and to its supplementation by voting machines, are reforms. Similarly, civil service reform regards the existing patterns of administrative organization as good, but endeavors so to reorder the administrative machinery as to inhibit patronage and the spoils system and to take officeholders out of politics by means of competitive examinations, security of tenure and the like. "Reform" schools are postulated on the constancy of human nature and operated with the purpose of redirecting human habits. Tariff reform has analogous attitudes and premises with respect to markets. So have spelling reform and temperance reform regarding their respective fields.

Some ostensibly revolutionary movements may have reformist programs while many reformist movements may have revolutionary implications. Such, for example, are the single tax movement in the United States and Fabianism in England. Fabianism has been difficult to distinguish in its essential direction and goal from liberalism, and indeed the Fabian Society always numbered a great many liberals among its members. The single tax is declared by its champions to have revolutionary implications. What would make a reformer of a single taxer or a Fabian would be staking the solution of all social problems and the remedying of social evils exclusively on some one specific individual doctrine or measure. Prohibitionists are reformers of this order. They advocate prohibiting the production and consumption of alcoholic beverages as a social cure-all. Single taxers treat their proposed method of taxation in the same way.

It is this insistent exclusive particularism which distinguishes the reformer from the revolutionary as a psychological type. The reformer might be described as a fetishist, the revolutionary as an apostle of a new faith. The Fabianist or the single taxer regards some particular component of the existing establishment as of paramount importance in the well being of the entire structure. The champion of the new faith desires to abolish established faiths altogether. The reformer does not quarrel with the totality of the mores. He merely wishes to make some individual component of them dominant. The revolutionist aims to transform the mores in toto.

Instances of sheer reformism may be found but on the whole reformism is usually met either as an incidental accompaniment of other attitudes, such as the conservative, the liberal and the revolutionary, or as a distortion of them. When it appears as distortion, it goes, as a rule, with psychopathic traits of the personality, of the kind commonly to be observed in official and volunteer censors, in spelling reformers, in professional patriots, and in similar riders of hobbies which give the impression of being compulsive. In the young, reformism of this type is often no more than a phase of adolescent and post-adolescent conflict projected outward. In the mature it may be the stereotypy of the youthful condition, or the defensive projection of an unwonted inner urge.

Within the context of the aggregated totality of social life, reformers and revolutionists are simply names for the different focalizations of the process of social interaction. Reformers serve as points of division for social forces, now liberating them, and again damming them up. They appear always to function as dynamic and not inert members of any given social situation in which they figure. They enter into that situation as correctives or adjusters, and their consequences are very rarely congruous with their powers and intentions. As a rule, the consequences fall far short of, and sometimes, tremendously exceed, that which the reformers have planned. The cases of ballot reform, civil service reform and prohibition present outstanding instances of this ambivalent inadequacy.

REFRIGERATION. While the use of natural ice and snow for the preservation of meat and fish has been employed sporadically ever since prehistoric times, the origins of the modern industry of refrigeration may be assigned to seventeenth century England, where natural ice obtained from nearby ponds was being hawked from carts by London fishmongers. In Paris also toward the end of the same century snow and ice were being sold regularly. By the beginning of the nineteenth century natural ice had come to be regarded as an established article of commerce and supplies were steadily acquired by butchers, fish dealers and confectioners.

The natural ice industry was first developed in the United States and Norway. The pioneer in the American ice trade was Frederick Tudor of Boston, who began his business in 1805 by catering to local needs and by making shipments of ice to the West Indies and the southern states. Before very long he had exhausted the possibilities of neighboring ponds and rivers and was cutting ice in Maine for shipment to the Boston area. The advent of brewing, particularly in the middle west, gave a further impetus to the industry, with the result that in the post-Civil War period ice making became an important activity in middle western centers. The census of 1880 estimated that the natural ice harvest, after due allowance for waste, probably yielded more than 8,000,000 tons for actual consumption. A large export trade in ice, with the United Kingdom and the West Indies as the chief markets, flourished from 1870 to 1890; in 1872, 53,553 tons of ice were exported, but by 1900 the total had dropped to 13,720 tons. The European trade was almost completely monopolized by Norway, which supplied Germany and the United Kingdom, for the most part for their fishing trade.

It is interesting to note that whereas the United States by the end of the nineteenth century was a large consumer of ice, in Europe ice consumption had not yet made any real progress. Natural ice had never been used extensively for refrigerating purposes, while such artificial refrigeration as was being practised was applied chiefly to perishable articles in wholesale quantities; that is, in the cold storage industry. Indeed today, even after the great advances made in mechanical refrigeration, the United States is still the only country where refrigeration is generally known and more or less widely used both for household and for commercial purposes.

From the second decade almost up to the end

of the nineteenth century food preservation by dehydration, heat sterilization and chemicals was being more widely used than refrigeration by natural ice. Tinned, or canned, meat and beef extract were made available for commercial exploitation as a result of the inventions of Nicolas Appert, Augustus de Heine, the brothers Pellier and Justus von Liebig during the years 1809 to 1863. In fact by 1880 England was importing 8000 tons of canned meats from Australia.

Even prior to the application of mechanical refrigeration the search for some means of transporting and storing fresh meats, fish, fruits and other perishables without change in their taste or texture led to experiments with refrigeration systems using natural ice or brine mixed with natural ice. Crude refrigerator cars, heavily insulated and cooled by tanks or cylinders of crushed ice and salt, were used in experimental shipments of meat and fruits in the United States as early as 1868. Shipments of chilled and frozen beef from the United States to England were made in 1874 and 1875, one of them using blocks of natural ice in a container which occupied 25 percent of the refrigerated chamber space and another using brine circulated in pipes, cooled by a mixture of ice and salt. Cold storage warehouses, cooled by blocks of natural ice or by ice and brine pipes, were in operation at Boston, Chicago and London by 1875. However, the use of natural ice was limited by the expense and uncertainty of procuring and preserving an adequate supply, particularly at points far distant from the source. It was only when mechanical ice making machines gradually came into use that a supply of ice was assured for refilling the bunkers of railroad refrigerator cars on 3000-mile journeys across the American continent.

The physical foundations for the present systems of mechanical refrigeration were laid in the first quarter of the nineteenth century. The discovery by physicists of the dependence of temperature upon pressure provided the theoretical basis for experiments with compression and absorption systems using air or a volatile liquid as the refrigerant. The inventor of the forerunner of the modern compression apparatus, his model being patented in 1834 with ether as the refrigerant, was Jacob Perkins, an American then residing in England. Many of the earlier commercial machines introduced by John Gorrie in the United States and by J. J. Coleman, A. S. Haslam and T. B. Lightfoot in

England also depended upon the expansion and compression of air. The first successful shipment of meat from Australia to England arrived in 1880 on the *Strathleven*, which was equipped with a Beil-Coleman cold air machine. During the 1890's the dry air machines for reasons of economy gave way in importance to those based upon the compression and expansion of a volatile liquid, such as ammonia, carbon dioxide or sulphur dioxide. These had been developed by J. C. De la Vergne in the United States, Charles Tellier and Ferdinand Carré in France, James Harrison and T. S. Mort in Australia and Carl von Linde in Germany between 1850 and 1880.

By 1890 the new methods of refrigerated storage and transport were well established. The Mechanical Refrigerating Company began operation in Boston in 1881. A Chicago ice cooled warehouse shifted to mechanical installation in 1886. In 1882 on the Victoria Docks in London, the London and St. Katherine Docks Company installed a cold air machine in a small underground chamber with a capacity of 500 sheep carcasses. Transatlantic ships, beginning with the *Circassia* in 1879, were rapidly fitted with mechanical refrigeration. American railroads were hauling meats to eastern markets in refrigerator cars, mostly owned by the meat packers, and were building up a traffic in fruits and vegetables from California and Florida to New York City.

The stimulus afforded by refrigeration to the transportation industry was startling. The transcontinental movement of fruit from the west coast of the United States to New York City grew from one experimental shipment in 1889 to 4000 carloads in 1900 and 65,000 carloads in 1927. Deliveries of fruits and vegetables from the south and west by the Pennsylvania Railroad at its New York City terminals increased from 7000 packages in 1890 to over 500,000 in 1927. Imports of fresh beef, frozen and chilled, into the United Kingdom grew from 55 tons received from the United States in 1874 to 483,000 tons received in 1910 from South America, the United States, Australia and New Zealand. From 1874 to 1910 nearly 5,000,000 tons of fresh beef alone were shipped to Great Britain from overseas.

The urban consumer was no longer compelled to depend upon seasonal supplies of perishable produce obtained only from local sources. In their *History of the Frozen Meat Trade* Critchell and Raymond estimate that the annual United

Kingdom per capita consumption of beef, mutton and pork, which was limited to 72 pounds in the decade 1851-60, expanded to 110 pounds by 1882, 43 pounds being furnished by imports. By the 1930's the *Fruit and Vegetable Trade Journal* of the Covent Garden (London) Market was able to report that English tables were being supplied with peaches, plums and apricots from South Africa; apples from Nova Scotia and various sections of the United States; pears from California; grapefruit from the West Indies; oranges from Java, Spain and California; and lettuce, asparagus and cauliflower from France. In 1932 the fresh fruit and vegetable supply of the New York market was drawn from 43 states and 23 foreign countries at an average haul of over 1500 miles. The yearly shipments of fresh fruits and vegetables in the United States now exceed 1,000,000 carloads, approximately 80 percent of which is under refrigeration.

The rise of refrigerated transportation brought fundamental changes in the geography of production. Meat and fish packers, fruit shippers, butter manufacturers and poultry dressers hastened to establish operations in far away producing sections where supplies were cheap and abundant but hitherto unavailable to world markets. The herds of cattle and flocks of sheep in Australia and New Zealand and on the Argentine pampas multiplied, while those in England declined. Danish and New Zealand butter captured the English market. Vast tracts of territory, such as the Imperial Valley in southern California, were developed under irrigation to produce cantaloupes, watermelons, lettuce, asparagus and tomatoes for consumers nine days distant by the fastest freight train. The face of the production map was altered beyond recognition by refrigerated transport.

The cold storage industry was another off spring of mechanical refrigeration. In the United States the space in cold storage warehouses is estimated to have increased from approximately 100,000,000 cubic feet in 620 plants in 1904 to nearly 700,000,000 cubic feet in 1363 plants in 1927. In the latter year about 400,000,000 cubic feet were located in public and combined public and private warehouses handling all manner of perishables; the remainder was in private storage establishments, primarily those of the meat packers. The growth of the cold storage industry brought with it important improvements not only in the technique of mechanical refrigeration but also in that of humidity control, protection of products

by glazing or wrapping, and other measures which reduce deterioration from desiccation, oxidation, rancidity, absorption of foreign flavors, and molds and other contaminations.

Cold storage warehouses act as reservoirs to carry surpluses of seasonable produce commodities over into the period when consumption exceeds production. Thousands of tons of apples, pears, poultry, fish, eggs, butter and cheese are held in terminal warehouses from a few days to many months. Cold storage warehouses are not confined to terminal consuming areas, many being located in producing areas and at intermediate transit points. At producing points they are used for temporary storage and for precooling of fruit to be shipped in refrigerator cars. Storage houses at transit points are used to hold products destined for wide distribution and also often form an important adjunct to the transportation systems in the manufacture of artificial ice for re-icing of refrigerator cars.

The growth of the cold storage industry was accompanied by public complaint against the sale of cold storage products without proper identification as well as against the alleged monopoly of distributing channels and the manipulation of prices. In the United States this resulted, beginning with 1911, in the appearance of legislative and administrative regulations of the conduct of the industry and the sale of cold storage products. As a rule the basic laws provided that cold storage plants should be placed under the inspection of state authorities, that cold storage goods should be marked as such and that goods could be retained in cold storage for limited periods only (6 to 10 months). In recent years there has been a tendency to repeal such laws and to substitute minimum quality specifications for certain products, such as eggs, regardless of the length of time held in refrigeration. The alleged monopoly features of the cold storage business have been generally met by laws placing warehouses under the regulation of public officials.

The manufacture of artificial ice was another development of mechanical refrigeration. The ice manufacturing industry in the United States increased from 775 plants in 1899 to 4110 plants in 1929, employed 6880 wage earners in the earlier years as compared with 32,184 in the later year and manufactured 4,000,000 tons of ice in 1899 as compared with 44,000,000 tons in 1929. By 1918 the production of artificial ice in New York City exceeded the receipts of natural ice harvested from the upper Hudson River. By

that year there were approximately 100 plants with a combined daily capacity of 16,335 tons, which were manufacturing and selling 1,800,000 tons per annum of artificial ice in New York City.

The corporate history of the ice business in recent years has followed the familiar course of other industrial activities. Consolidations and mergers of companies have taken place and the appearance of public utility companies in the ice manufacturing field has been of particular interest. However, plants have not increased in size and the ice business still seems to be largely localized. Freight rates and handling charges are high, and there is considerable loss of weight and deterioration of quality when ice is kept in freight cars. In order to protect itself from competition the industry, through trade associations, has worked out informal agreements, combinations of delivery systems and consolidations of local companies. As Mr. Justice Brandeis in his dissenting opinion in *New State Ice Company v. Liebmann* [285 U. S. 262 (1932)] has pointed out, the ice business in the United States has acquired many of the attributes of a monopoly. In Europe and elsewhere, because the consumption of ice is not nearly so common, the industry is relatively unimportant. The maximum daily output of ice in London was estimated in 1923 to be about 2000 short tons, as against 16,000 tons in New York City as of 1918. Ice production and consumption in tropical cities are much lower than in cities of similar size in the United States. In 1923 the output during the warm season in Mexico city (population 968,000) was estimated at 150 tons per day; in Havana (population 585,000), 700-800 tons per day. In a number of European cities ice plants are owned and operated by municipal authorities.

A recent development of great potential significance in the preservation of foodstuffs by refrigeration is the so-called quick freezing (less than 1 hour) of fish fillets, cut meats and fruits and vegetables. The process of freezing whole fish has been known and practised for more than 60 years, but the earlier methods required a period of from 10 to 48 hours. In the decade before the World War German experiments and small scale Danish and Norwegian commercial activity in freezing fish by direct immersion revealed that quick freezing resulted in a superior product in that the flesh of fish frozen in this manner retained its juices, flavor and texture much better upon defrosting than did the slow

frozen fish. Authorities are not in entire agreement as to the explanation of this phenomenon. Some advance the theory that the smaller ice crystals formed in the tissues by quick freezing are more easily contained in the elastic cell walls and do not rupture the membranes or allow the juices to flow out upon defrosting. Others call this physical, or mechanical, explanation erroneous, as evidenced by experiments which show that destruction of cell structure in fresh fish by mechanical means results in very little loss of juice. These authorities seek the explanation of the superiority of quick freezing in colloid chemistry.

At all events the introduction of quick freezing began in 1924 to revolutionize the fish industry of the United States and has since made some progress in the meat, fruit and vegetable industries. In 1929 a total of 120,000,000 pounds of fish was reported as frozen by the various warehouses and freezing plants in the United States. The more modern methods of quick freezing substitute indirect contact for direct contact with brine by immersion or spray. Fish fillets, cut meats and packages of fruits are placed in metal plates or pans which are immersed or floated in or sprayed by brine solutions, ranging in temperature from 0° to - 50° Fahrenheit according to the process employed.

The quick frozen product is packaged either before or after freezing, stored at a low temperature and distributed in insulated cartons by refrigerated freight cars and trucks. Among the advantages claimed for quick frozen products, in addition to the palatability, attractiveness and convenience to the consumer, is the reduction in wastage. For example, under the old method of distribution 185 pounds of inedible portions, ice and container accompanied every 40 pounds of edible fresh fish. Now the 40 pounds are shipped in attractive, branded packages, self-refrigerated; and the inedible portion is converted into useful by-products at the packing plant.

Extreme price fluctuations and glutted wholesale markets have largely been eliminated in the fish industry by the new methods of distribution, founded upon the quick freezing process. On the other hand, it is now possible to build up more or less permanent surpluses of cold storage warehouse stocks, which may affect the long time trend of prices. In this respect the fish industry may be following the meat, butter, cheese, egg and poultry trades, where refrigeration and cold storage warehousing have brought

new price making factors into being by conserving and carrying over seasonal supplies.

Outside of fish distribution quick freezing has made but limited progress. An impressive number of products, including steaks, chops and roasts, berries, peaches, cherries, peas, beans and spinach, have been frozen and offered for sale to the consumer at certain retail markets and in hotels, restaurants and institutions. There are numerous problems and difficulties yet to be solved before these products can be said to have achieved a significant position in the food trades or the family diet.

Some of these are production problems related to the quality and cost. Much remains to be done in the field of production research. The high cost of fixed plant installations combined with the seasonal character of supply, particularly in fruit and vegetable areas, presents difficulties which may perhaps be met by the use of mobile equipment. Distribution problems are equally important. Quick frozen foods must be stored and handled at lower temperatures than other products. Adequate low temperature rail and truck transportation and cold storage facilities are not always available. The ordinary retail market or grocery store is ill equipped to store or display goods at low temperatures. A number of companies are now engaged in the manufacture of refrigerated display cabinets, but the cost is such that the retailer with little capital must be financed in his purchase of this equipment.

Nor is the consumer prepared to accept frozen foods on a large scale. Fewer than 20 percent of the houses wired with electricity in the United States have automatic refrigeration systems. Sales of electric household units increased from 4000 in 1921 to 965,000 in 1931. Total installations were estimated at the close of 1932 as over 4,000,000. The principal obstacle to the spread of frozen food consumption, however, is the availability of fresh, unfrozen produce at all seasons of the year, transported under refrigeration at relatively low cost.

The growing importance of perishable foods, whether fresh or frozen, reflects the triumph of refrigeration. At least 75 percent of the family food purchases of the urban consumer in the United States fall within the perishable class—fresh meat, poultry, milk, butter, cheese, eggs, fruits and vegetables, fish. It is common observation that this portion, particularly milk, fish, fruits and succulent vegetables, has been growing, while the consumption of cereals and

of dried and canned products is increasing less rapidly or actually declining.

REFUGEES. Any person who under the stress of *force majeure* has left his home and become dependent on the hospitality of others is a refugee. For the purposes of the present discussion, however, the designation may be restricted to persons who have left the territory of the state of which they are or were nationals and no longer enjoy the effective protection of that state.

Even this definition covers a wide variety of cases. There is the individual political refugee who is still legally able to return to his state but does not do so because return would expose him to disagreeable consequences. There are cases in which some of the inhabitants of a country, including at times the government, have fled across its frontiers before invading forces. In older days it was not uncommon for an entire national community to migrate, abandoning its former territory to an enemy.

The individual political refugee has been a familiar figure in history. Since the days of

David and of Coriolanus it has been common for a prince or pretender, worsted in his home country, to find welcome and support, alone or with his adherents, at the court of some neighboring state. This situation still recurs (as recently as 1924 the present king of Albania was sheltered and assisted in making a bid for power in Yugoslavia) and will continue so long as states exist which are anxious to exploit the embarrassments of their neighbors. At the present time, when politics are based less on dynastic considerations and more on broad social tendencies, it has become common for a state to welcome the victims of a social regime dissimilar to its own. Thus the non-revolutionary countries of Europe sheltered the émigrés of the French Revolution, and states with liberal institutions, such as England and Switzerland, have often harbored refugees from the rule of autocracies. Mazzini, Karl Marx, Lenin and Trotsky stand out as famous examples of refugees of this type. Many countries make it a point of honor to grant an unrestricted right of political asylum, although this has often involved them in difficulties with the governments concerned. In fact many revolutions have been hatched on foreign soil. On the other hand, the part played by refugee movements in keeping alive the national spirit of a country oppressed by a foreign autocracy has often been very important; notable cases are those of the Magyar emigration after 1848 and the Polish exodus after 1863. Since 1919 Paris and Vienna have been the main centers for political refugees. Some of these settle down permanently abroad, but most of them hope and many are able to return eventually to their homes. Their numbers are generally few, and if their political importance has often been very great, the economic problem which they present is small, particularly when they are supported either by comrades at home or by sympathizers, private or official, in their place of refuge. As a rule they consist chiefly of the intellectual class, which requires little capital to establish itself.

The problems presented by large scale refugee movements vary widely. In earlier days, when the prevailing mode of life was still largely nomadic, it was quite common for whole national communities to become refugees. Refugee movements are indeed difficult to distinguish from simple migrations or wars of conquest, and such distinctions as can be made are often blurred by later events; but it may be fair to treat as refugee cases only those in which the

persons involved were more or less at the mercy of those receiving them.

It is impossible to do more than give examples of this type of movement. For some centuries the Roman Empire received innumerable national communities of refugees, mainly of Germanic or Turki origin. When few in numbers, they were usually drafted with the army; when numerous, they were given the status of *foederati*; that is, they were left under their own chiefs, given lands, generally on the frontier, and employed on frontier defense. In an age in which land was plentiful, population sparse, the standard of living low and its manner simple the economic problem involved by this process was not at all complex; a grant of vacant land and perhaps a supply of one harvest's seed corn commonly sufficed. Occasionally emergency relief was given; the failure to supply such relief when promised to an exceedingly powerful body of refugees, the Visigoths, and attempts by the local population and officials to profiteer at their expense led in 378 to one of the decisive battles of the world, that of Adrianople. Outbreaks of plague, cholera and similar epidemics were apparently frequent among the refugees, and those who had no military value were often enslaved. The ethnographical and political consequences of the large scale admission of these communities were very great, for when the central authority weakened they recovered their independence and formed national states in their new homes.

Similar movements went on throughout the Middle Ages, particularly in the countries bordering on the great and ever unquiet Eurasian steppe. A variety of tribes took refuge with the various Russian princes or the kings of Hungary. They were usually granted land for settlement and certain economic and social safeguards (e.g. self-government, exemption from taxation), in return for which they had to perform military service whenever required. The famous Cossack bands of south Russia originated with Turki hordes who had taken refuge from stronger nations in the steppe, being reenforced by Russian and Ukrainian runaway serfs and masterless men, who preferred dangerous liberty to tilling the land under a Polish or a Russian lord. In 1239 Hungary received 200,000 Cumans, the survivors of a great battle with the Mongols on the Volga, and later Hungary and Austria gave shelter to many Serbian and other fugitives from the advancing Osmanli Turks. In doing so they provided themselves with sorely needed military reenforcements; but the benefit

was not unmixed. The wild immigrants solved their own economic problem by plundering the local peasants; while, since man power was valuable, the loss of it was resented by the ruler from whom the refugees had fled. The Mongol khan used the pretext that the king of Hungary was sheltering his fugitive slaves (the Cumans) to invade and practically destroy Hungary. A similar complaint by the Turkish khan with regard to Justinian's relations with the fugitive Avars in 558 had led to the first diplomatic relations between Europe and central Asia.

The part played by refugee movements in spreading knowledge has often been important. The manuscripts brought to western Europe by fugitive Greek monks after the fall of Constantinople gave an immense impetus to the revival of learning and arts known as the Renaissance; and knowledge of other types was widely spread by the religious refugees who were so numerous in a somewhat later age when, as conditions of life became more settled, national migrations ceased to be frequent (although they occurred up to quite modern times in central Asia and Africa).

From the sixteenth century to the eighteenth the commonest type of refugee was the religious. It is hardly necessary to stress the part played by such refugees in many events of world importance, such as the formation of the United States. If some of the earlier American colonists were adventurers, many were true religious refugees, such as the Pilgrims of the *Mayflower* and the earlier inhabitants of Pennsylvania, which, founded as a Quaker colony, afterwards became a home of refuge for dissidents of many other faiths. Land was still plentiful, and many of these refugees had time to make their preparations and to take with them the supplies necessary for their establishment. The American colonists moreover retained the protection of their governments and were not altogether in a friendless condition.

Far worse of course was the case of victims of fanaticism, such as the Moors expelled from Castile in 1502 or the Moriscos driven out in 1609, who were given only three days to embark and allowed to carry only their personal property with them; the sale of their immovable property was expressly forbidden. No provision was made for their reception in Barbary, and most of the half million or more victims perished.

The story of the Protestants expelled from various Catholic countries during the Counter-

Reformation is much happier. They were usually welcome in Protestant countries, both out of religious solidarity and for their useful virtues; and while their expulsion nearly always impoverished the country which they left, their reception enriched that which they entered. English weaving, water engineering and finance owe much to the Dutch merchants, weavers and artisans who fled from the terrorist rule of the duke of Alva and to the later Huguenots; and Prussia had no more useful colonists for the waste spaces of the present Polish Corridor than the Austrian Protestants expelled from Salzburg.

A special and important place in the history of the movement is held by the Jews, who may be called a nation of refugees. In the Middle Ages and the Renaissance their experience was parallel to that of other religious refugees. In the fourteenth century masses of them fled from Germany before the crusaders and Flagellant friars but were received hospitably by the kings of Poland and Lithuania, who granted them substantial privileges and assigned them the role of a middle class. Since there had hitherto been virtually no middle class in eastern Europe, the influx caused no great dislocation of the economic life, particularly as the Jews were denied admission to existing guilds and industrial corporations. Likewise the professed Jews expelled from Spain in 1492 were well received in the Ottoman Empire, which saw the benefit of introducing an intelligent middle class. The individual loss and suffering attendant on these large scale migrations were, however, very great. The German Jews were fleeing for their lives; the Spanish Jews had received four months' notice but had no adequate means of disposing of their property or collecting debts due them.

In the late nineteenth and the early twentieth century a steady stream of Jewish refugees from actual or threatened persecution in Russia and Rumania poured westward into England and the United States. For the first time these refugees had to face the modern problem of fitting into a social organization already highly developed. As, however, the labor market was still in general expanding, the difficulties could be met by transitional assistance and relief. To this end the great Jewish associations were formed; the Alliance Israélite Universelle, for example, carried through remarkable work in assisting migration, organizing emergency relief, advancing settlers the means to establish themselves, maintaining schools and assisting poor scholars. The

Jewish Colonisation Association was concerned principally with agricultural settlement. It founded colonies as far apart as Russia and Brazil, Palestine and the United States. The later emigrants generally enjoyed the help of relatives who had preceded them. Thus the Jews led the way in organizing the essential of refugee settlement—provision in advance of the means to tide over the transitional period.

Refugee movements of the old type still occurred in the Balkans, particularly in Macedonia, where at least four nations—Turks, Bulgars, Serbs and Greeks—were contending for mastery, each taking every opportunity to destroy all members of the exceedingly mixed population which did not belong to its own nationality. Each bout of fighting or change of sovereignty thus gave rise to large refugee movements, the members of the defeated nationalities fleeing to their kinsfolk. It has been estimated that in Macedonia alone, in the short period from 1912 to 1925, seventeen migratory movements took place, hundreds of thousands of persons being affected. Bulgaria alone received some 250,000 immigrants from 1878 to 1912.

All Balkan countries were affected, and a rough and ready exchange of population took place, the incoming refugees driving out earlier inhabitants of a hostile nationality and settling on their lands. In 1913 the idea arose of organizing this exchange. Meanwhile various west European and American committees helped to relieve the distress. Charitable bodies, like the Quaker societies, began to organize emergency relief in all parts of the world for refugees who hoped to return to their homes when the crisis was past. The foundation of the International Red Cross Society was also of inestimable value.

The importance of modern organization was tested in the World War, when the governments and considerable fractions of the populations of Belgium, Serbia and Montenegro fled from their homes before the armies of the Central Powers. Two hundred thousand Belgian refugees entered France, and an equal number took refuge in England. The latter were received and cared for by the War Refugees Committee headed by Lord Hugh Cecil, financed by voluntary subscription with government assistance and facilities. After a transitional period the refugees were absorbed into the economic life of the country and after the war were repatriated. The Serbian government was established in Corfu and the refugees, after transportation in allied vessels to that city, were distributed throughout Europe

although largely in France, being supported by voluntary effort and by the allied governments. Although the mortality among the refugees was high, the organization for dealing with them was certainly more efficient than any which had preceded it.

After the war there was an influx in the opposite direction, from the succession states into the territory of the Central Powers. The governments concerned were usually prepared to receive and to grant nationality to refugees of their own race. The German Flüchtlingsfürsorge maintained concentration camps and placing offices. Hungary gave many Magyar refugees posts in its administrative services, thus gravely burdening the national budget. The fate of unwanted elements, however, was tragic. These were too often refused naturalization and were relegated to the ranks of the stateless.

A far more serious problem was created by the exodus from Russia. As a result of the Russian Revolution and subsequent civil wars millions of Russians had been uprooted, and of these about 1,500,000 members of the former ruling class or of counter-revolutionary armies were clearly unable to return to their native country. In 1919 and 1920 about 100,000 of these were in Manchuria, from 300,000 to 400,000 in France and Germany each and the remainder in eastern Europe. The sudden arrival of General Wrangel's counter-revolutionary army in Constantinople made that city a special center of congestion and extreme misery.

The allied governments, the charitable organizations and the east European states were spending large sums on relief; but this could not continue indefinitely, particularly as the last named were themselves very impoverished. It was urgently necessary to relieve the congested centers and place the refugees throughout the world where they could find work. For this purpose an international authority was indispensable, particularly since many refugees had no identity papers whatever and governments were often extremely suspicious of Russian refugees as possible Bolshevik agents.

In 1921 the International Red Cross and other great charitable societies requested the League of Nations to appoint a high commissioner to supervise the work in connection with the Russian refugees, define their legal position, organize their employment and repatriation and coordinate the efforts of the charitable organizations. In August, 1921, Fridtjof Nansen was appointed League high commissioner.

Besides the Russians Nansen subsequently took charge of the 200,000 to 250,000 Armenians who had survived the war and the massacres in Turkey and had fled into Greece, Bulgaria or the new French mandated territory of Syria, with some smaller groups of Assyrians, Assyro-Chaldeans and a few Turks who likewise had no natural protectors. The League has refused, however, to take over the "stateless persons" of central Europe or such political refugees as the Ruthenes and Montenegrins. These remain dependent on chance or charity.

The work was carried on first by Nansen, then, under his supervision, by the International Labor Office and after Nansen's death by the Nansen International Office for Refugees, an international bureau under the auspices of the League, which contributes toward its upkeep. The office is assisted by an Inter-Governmental Advisory Commission, on which the chief governments interested are represented, and an Advisory Committee of private organizations. The center is in Geneva, and many governments help the office to maintain local representatives.

The office acts as the agent for the distribution of certain relief funds; but its functions are not to supply relief, which if given at all is administered by governments or private societies. Its object is to enable the refugees to be absorbed in normal economic life. The most desirable solution is clearly repatriation. Nansen succeeded in negotiating the unmolested return of several thousand Russians. A plan to irrigate a tract around Erivan in the Soviet Republic of Armenia and settle there 50,000 Armenians fell through because governments would not supply money or accept the security for a loan offered by the Soviet government. Recently, however, the government of Erivan itself has undertaken the cost of the scheme, and 20,000 Armenian refugees are to be settled there. Some thousands are returning annually to Erivan. For those definitely unable to return, "Nansen passports" for Russians and Armenians respectively were introduced; these were accepted by many governments in lieu of ordinary passports. Subsequent intergovernmental arrangements have enabled the holders of these certificates to enjoy certain rights usually granted to foreigners by treaty. They are thus no longer entirely defenseless, although their rights still lag far behind their needs.

The Nansen passports have proved a great help in the work of settlement. The relief of the congested areas was carried through with con-

siderable success, the office acting as organizer and intermediary. It soon became clear that the work was one of detailed placing in a labor market which was overcrowded in most countries. France and Belgium, however, absorbed large numbers for several years, and some refugees were successfully placed in oversea countries. The office still deals with several thousand cases annually. The economic depression which began in 1929, however, hit the refugees severely. They were usually the first to be discharged from employment and were sometimes expelled from their countries without a home to receive them. In 1933 nearly 150,000 who were able to work were unemployed.

The office proposes to wind up its work by December 31, 1938. It has done invaluable service at a cost which has never exceeded a few thousand pounds annually; but it is clear that the only final solution lies in repatriation or nationalization, and the latter is growing increasingly difficult in modern times.

A special settlement scheme was carried through in Syria by the mandatory government with the help of the Nansen office for the Armenians, thousands of whom had spent years in malarial concentration camps, foci of misery and disease. New urban quarters and some village settlements were constructed, and the camps were to be closed at the end of 1933. In this way about 40,000 Armenians were definitely settled.

Somewhat different problems arose in connection with Greece and Bulgaria. In the autumn of 1922, after the crushing defeat of the Greek army by the Turks in Anatolia, over 1,000,000 destitute and panic stricken Greek refugees poured into Greece from Anatolia and Thrace. Greece was willing to receive them and to grant them nationality, but the task was far beyond its powers. Nansen was empowered to deal with the emergency and to distribute relief and medical aid. Afterward an exchange of population between Greece and Turkey was arranged. This raised the final number of immigrants to some 1,700,000 but left a reasonable amount of land available for their settlement. The League of Nations gave its authority for the raising of a loan of £12,300,000, which was administered by a Refugee Settlement Commission consisting of representatives of the League and of the Greek government. The work was handed over to the Greek government on December 31, 1930. It has been brilliantly successful. Over 50,000 agricultural houses and some 30,000 urban

houses have been built and about 170,000 agricultural families and 25,000 urban families established and maintained through their initial difficulties at an average cost of £14.0 per person. The appalling mortality of the first period has been checked, and the refugees have been turned into self-respecting and self-supporting members of the world community. The face of Macedonia has been reconstructed, drainage and irrigation have been carried through and a new source of wealth has been added to the world.

Similar work on a smaller scale was accomplished in Bulgaria, where out of the 220,000 refugees who had entered Bulgaria between 1913 and 1925 about 30,000 families, or 120,000 individuals, needed help. The task was begun in 1926 and almost completed by 1933. A loan of £2,400,000 and \$4,500,000 was raised under League auspices. The land was surveyed and allotted, houses were built and drainage and improvement works were carried out. Incidentally the general health and agricultural standards had been greatly improved, both in Bulgaria and in Greece.

It is clear that the refugee problem has been affected profoundly by modern conditions of life. In the increasing complexity of present day society a man is less easily able than ever before to dispense with the normal protection of his state; and the delicate relations of economic life are more easily dislocated, and with more disastrous effects, than the cruder conditions of the past. Greece and Bulgaria were still exceptional cases, since the recent movements of population had made land available for the immigrants, whom the new countries could regard as a source of strength and wealth. Even so there was much ill feeling between the immigrants and the other inhabitants; and while the help of the League enabled the settlement to be carried out with comparative ease, the process was basically uneconomic, since subsequently neither country was able to meet the full service of the settlement loans. The position of the refugee who has no mother country to receive him is miserable indeed. Modern organization of charity and relief and advanced medical knowledge may relieve the acuteness of the first crisis. But the ultimate absorption of the refugee who is unable ever to return to his home has become increasingly difficult. The question has been inordinately complicated by the excessively difficult economic conditions of the post-war period. On the other hand, it is only in times of difficulty and unrest that refugee movements on a large

scale are likely to occur. Where repatriation has proved impossible, naturalization is the only final solution. The countries which are reluctant to facilitate this solution might well reflect on historical evidence, which indicates that while refugee movements have usually occasioned great suffering among the refugees themselves, they have often enriched the countries which have granted hospitality and have almost uniformly impoverished those from which they fled.

REGIONAL PLANNING. The need for regional planning is evident in the growth of the modern metropolis beyond its officially designated city limits. During the decade from 1920 to 1930 the increase in population of the 85 largest cities of the United States was 5,622,986, a rise of 19.4 percent; but the growth in the population of the areas in the metropolitan regions surrounding these cities was 4,362,936, amounting to 39.2 percent. This change in pop-

ulation distribution is typical of urban communities in other countries as well. The chief causes of this spread of population in suburban areas beyond the city limits are to be found in the rapid development of modern science and transportation, especially the motor vehicle, the increasing tendency toward industrial decentralization and the growth of residential suburbs. Because the extension of the city limits has not kept pace with the spread of population, grave problems of municipal administration have resulted, bringing with them new and difficult changes in city finance and taxation. In an effort to meet these problems the movement for regional planning has grown up, sponsored both officially and unofficially by municipal and industrial engineers, architects, housing experts, economists and rural and town planners. In most cases the regional plan does not correspond in area with any single administrative unit. There is no government organization ready to approve and execute the plan, which moreover usually has no legal sanction. The chief value of regional planning is that it takes care of problems which are dependent upon the consideration of two or more communities, thus providing a method of action without annexation or actual amalgamation. Although cities and their suburbs have remained politically separate, the city and its surrounding areas are becoming more and more interdependent. This interdependence is evident in the public utilities, in provision for education, in recreation facilities, in land uses, in the transaction of private business and in the social and economic life of the region as a whole. The limited plans which have been made heretofore for the metropolis or for the surrounding communities have proved inadequate usually because they have not been comprehensive in character or well coordinated. They have been sporadic and timid, often limited to one subject, such as thoroughfares or parks, or else they have been concerned with only a single suburb or an area too small in extent to meet the requirements.

There are in the United States nearly a hundred regional planning commissions or organizations. These include unofficial organizations which act in a voluntary advisory capacity with a view to bringing about adherence to the regional plan, and official commissions created under the authority of a legislative act. Nineteen states and the District of Columbia are represented in the list, among them California, New York, Illinois, New Jersey and Pennsylvania. In

Illinois the State Chamber of Commerce has made studies to determine the advisability of forming a unified, systematic plan for the development of the state's resources. In Iowa the State Board of Conservation and the State Fish and Game Commission have issued a report on a twenty-five-year conservation plan. In New York state studies of widespread scope were made as early as 1925 by the Bureau of Housing and Regional Planning. Impetus is being given to the movement for non-urban planning by the activities of the National Land Use Planning Committee, composed of representatives of various federal departments and the Land Grant colleges, the purpose of which is to determine a plan for the suitable use primarily of rural land areas.

Good examples of regional planning in the United States are the Boston Metropolitan Planning Division of the Metropolitan District Commission; the Chicago Regional Planning Association; the Regional Planning Commission of Los Angeles County; the Milwaukee County Regional Planning Department; the Regional Plan of New York and Its Environs; the Niagara Frontier Planning Board and the Niagara Frontier Planning Association; the Regional Planning Federation of the Philadelphia Tri-State District; the Santa Barbara County Planning Commission; and the National Park and Planning Commission at Washington, D. C. The first official metropolitan regional planning in America was carried out in Boston with the appointment of metropolitan commissions for sewerage in 1889, parks in 1893 and water in 1895. These commissions were highly successful from both technical and administrative aspects. In 1919 the three commissions were combined as the Metropolitan District Commission. In 1923 regional planning received recognition in the appointment of the Metropolitan Planning Division. Other special Boston metropolitan commissions were appointed later.

The most notable metropolitan regional plan in the United States is that of the Regional Plan of New York and Its Environs undertaken in 1924 under the auspices of the Russell Sage Foundation. It presents a graphic plan of all ways of communication and land uses, indicating the areas best suited for business, industry, residential use and open spaces. Proposals are made as to express routes, other major regional routes, important connecting routes, new railway belt lines, suburban rapid transit and parkway systems. Specific plans are pre-

sented for civic centers, new railway stations and airports, waterfront improvements and pleasure resorts. The plan is advisory in character. It has been prepared to give guidance to over 400 municipalities in 3 states. Its scope in time extends to thirty-five years. Many of the proposals in the plan have already been adopted and in part executed. A regional plan association has been formed to promote the carrying out of projects and to keep the plan up to date.

A group of business and civic organizations of the regions contiguous to and including Philadelphia, Wilmington, Trenton and Camden in 1928 raised a fund of approximately \$600,000 to cover the cost of surveys, studies and preparation of a comprehensive regional plan. To administer this fund the Regional Planning Federation of the Philadelphia Tri-State District was incorporated in May, 1928. The directors established as a governing principle that the federation should not concern itself in any of its activities with political boundaries or governmental technique, but should confine its investigations and recommendations to the physical needs as related to growth and distribution of population in the area as a whole. The federation adopted as a corollary to this first principle the policy of acting in a purely advisory capacity. Its objective was to indicate the present and probable future social, economic and physical requirements of the region as a whole through planning technique. In order to assure faithful adherence to these policies the federation obtained the service of leading planning consultants, employed a staff of technical assistants and appointed a representative Technical Advisory Committee comprising about 200 of the chief engineering officials of the counties, cities, townships and boroughs of the region.

The program for the Tennessee valley is the first deliberate large scale effort in the United States to inspire a systematic and balanced development of the social and economic life of a given community. The act of Congress sets up the Tennessee Valley Authority, a corporation reporting to the president. Under his direction its function is to insure the emergence of a smoothly operating and well matured program. The act provides for the proper use, conservation and development of the natural resources of the Tennessee River drainage basin and of such adjoining territory as may materially be affected by the development. The general purpose is to foster an orderly and proper physical and social development of the Tennessee valley

area. The president is authorized in making surveys and plans to cooperate with the several states affected. The act contains a provision for the building of transmission lines as a "yardstick" of public transmission of power by which the effectiveness of the power industry may be measured. The authority is empowered to assist in moving families from abandoned mining and lumber camps to new communities, planned and built to combine agriculture and industry.

Throughout England and Wales more than a hundred regional plan committees of different kinds are at work, covering an area of over 10,000 square miles. Most of these schemes, however, while regional in scope, are really extended joint town planning schemes and are largely advisory in character. The regional plans are intended as an ideal goal rather than as a working program for immediate execution. They endeavor to secure the most suitable use of land, adequate means of communication, ample open spaces, the control of building development and the protection of the cultural and aesthetic amenities of the countryside. Among the many English regional plans the following selected examples may be mentioned: west Middlesex (suburban); mid-Surrey (semirural); Manchester (industrial); southeast Essex (rural); the Thames valley (preservation of amenities).

The Ruhr regional planning federation (Siedlungsverband-Ruhrkohlenbezirk) is the most notable illustration in Germany, and perhaps in the world, of a statutory body authorized to act either by controlling and coordinating or by actually carrying out plans which will serve the advance of regional planning in an industrial district. The planning legislation was established by the Prussian act in 1920. In the area under the authority of the federation, about 1500 square miles, there are 20 important towns and 10 rural district councils, the latter containing 17 small towns and 250 smaller rural communities. The federation is controlled by an assembly, an executive and a director. Fifty percent of the representatives to the assembly come from the county boroughs and rural district councils, the rest being delegates of industry, representing employers and employees equally. The principal work of the federation as fixed by law comprises the drafting of comprehensive plans for the entire district; reservation and care of large open spaces; planning and construction of the main roads; determination of traffic routes for the future development of railways, tramways and other forms of transit and transportation; selec-

tion of industrial sites; and housing. The work of the Ruhr regional planning federation is supplemented by the Ruhrverband, which deals with all regional matters pertaining to sanitation.

National planning is an attempt to coordinate regional planning, just as regional planning coordinates city planning. It should follow broad lines and take into consideration the requirements of the country as a whole, including open spaces, distribution of population, location of industries, public utilities and provision for various forms of circulation. Good examples of national planning are to be found in Scotland, Holland, Italy, Egypt, Soviet Russia and Mexico. National planning sometimes extends into international planning, as in the case of the navigable canals between Holland and Belgium, the proposals for the Danube River, the St. Lawrence River project for the United States and Canada, the Niagara Frontier Regional Plan and the plans for the Rio Grande River, involving joint action of the United States and Mexico. Rivers and valleys are units for planning and not natural frontiers. The natural frontiers are the sea, the desert and the mountains.

The best European example of national planning is that of Bonifica Integrale, launched in Italy by the law of 1928 as a regional planning program of national scope. The Sibari project is one of the most significant of its undertakings. In the watershed of the Crati and Sibari rivers the Fascist regime is engaged upon a diversified program designed to restore the richness and glory of the region which flourished in 500 B.C., but which has for centuries remained desolate. The Bonifica Integrale has as its definite objective the stabilization and betterment of rural life in all its aspects through the execution of a program of planned land utilization embracing the whole of Italy. It is a comprehensive and far reaching enterprise of social usefulness. The improvement works comprise the construction of arterial highways to afford an adequate transportation system connected with the railhead at the new village of Sibari. This village is one of eight model rural centers, each housing 500 inhabitants, and intended first to accommodate the workers on the project and later as homes for the settlers. The cost of the Sibari project, which is scheduled for completion by 1943, is estimated at \$12,500,000 and is to be shared largely by the state and by the interested landowners. The complete program for the national plan which has been adopted calls for a capital expenditure of \$500,000,000.

Giprogor, the Soviet state commission for planning cities, is entrusted with city and regional planning throughout the Soviet Union, with the exception of the Ukraine. It has undertaken some 60 projects, ranging from Leningrad to Sakhalin island in the Pacific and to Tiflis in Transcaucasia and is designed to apply to a total population of 35,000,000. Planning in the U.S.S.R. begins with the largest elements, the proper placing of industries and transportation for the state or nation. This leads logically to regional planning of large economic units. Two factors of great importance require mention: first, the public ownership of all land, which means that cities may be built according to plans that utilize the land to the best advantage; second, the size of cities, which in all other countries is an uncontrollable factor. In the U.S.S.R. this element is officially controlled in connection with all new cities and regions. Even in the older cities the planners search for permanent solutions which will not breed new difficulties for the future. Stalingrad is a good example of regulation of the size of cities on the basis of social, economic and industrial efficiency.

A National Planning Board for the United States has recently been appointed. Its duties will include studies of long range effects of public works and low cost housing from the social and economic aspects. The inquiries will concern all types of public works, federal, local and private. In an effort to enlist interest in the broader implications of regional planning the Harvard Graduate School of City Planning has introduced a course in national and state planning, designed to acquaint students with the changing social and economic needs of American life and to show the importance of long range planning in the physical development of the nation.

REGIONALISM. The term regionalism is of comparatively recent origin and has not yet acquired any accepted precise definition. It was first used in 1874 in the works of the Provençal poet de Berlioz-Pérussis but did not come into wide currency until the 1890's. Regionalism has been called a manifestation of "world federalism" and an intermediate stage between administrative decentralization and federalism. It involves such diverse problems of modern political and cultural life as those of minorities, administrative decentralization, local self-government and autonomy, the cult of homeland and earth and local patriotism. It is most

intimately related to particularism and opponents make the charge that it leads to separatism. In a very general way regionalism may be defined as a counter movement to any exaggerated or oppressive form of centralization. It must not, however, be considered solely from the viewpoint of political control or governmental administration. Regionalist problems arise only where there is a combination of two or more such factors as geographical isolation, independent historical traditions, racial, ethnic or religious peculiarities and local economic or class interests. Regionalism must be distinguished from nationalism in that it recognizes a higher national unity and superior national interests transcending the attachment to the local region. It must be distinguished also from mere sectionalism in that it is not based exclusively on regional economic or class interests but involves certain ethnic factors, such as cultural, traditional or linguistic peculiarities, which provide a basis for what is often termed a subnationality. Because of the wide ramifications of the subject regionalist problems may be discovered in any of the countries of Europe and America. But France as the classic land of political unity and administrative centralization is also the classic land of regionalism, and the French regionalist movement may be used as a paradigm for regionalist movements of other lands.

On the eve of the revolution France was a territorially unified and centrally governed state, thanks to the long established policy of its rulers. It was not, however, administratively centralized in the modern sense of the term, for it was neither legally nor economically unified. It was divided into the *pays d'élections*, with a royal financial administration, and the *pays d'états* (Brittany, Provence, Languedoc, Dauphiné, etc.), where a strong local consciousness prevailed despite the fact that the historical rights of the estates to levy taxes no longer played any important role. The revolution of 1789 accomplished the great historical feat of welding the nation into a unified state. July 14, 1790, the day of the great federation, was truly epochal because on that day small local defense groups and federations of national guards from cities and countryside merged together to form a self-conscious French nation. The leaders of the Constituent Assembly, headed by the abbe Sieyes, followed the tendencies of the monarchy in their drafting of the constitution. Not only did they retain the monarchy as the guaranty of

political unity; they went further and broke up into small *départements* the old provinces which, although no longer possessed of any administrative unity, had still preserved their own historical and cultural individuality.

As France became engaged in war with monarchical Europe the administrative centralization inaugurated by the Constituante developed into an all embracing revolutionary dictatorship and made the way clear for Napoleon's dictatorship and centralization. The law of Pluviôse of the year VIII (February 17, 1800), whereby the prefects, subprefects and mayors in the *départements*, *arrondissements* and municipalities were to be appointed by the first consul, marked the completion of French centralization.

Cultural centralization accompanied this administrative centralization. A national system of education from the village school to the highest institutions of learning was created by Napoleon and received the misleading appellation of Université Impériale, or Université de France. Napoleon's system of higher education has been compared to a strongly knit army. A grand master appointed by the emperor exercised supervision over the entire educational system, and all the provincial institutions and their faculties were dependent on him. It was not until 1806 that the academies became modern universities, juristic persons with corporate rights. This cultural centralization may be considered one of the leading causes of the spiritual poverty characteristic of the French provinces. The intellectual life which was still flourishing in the provinces at the time of the revolution was almost completely stifled during the following period. Everything worked toward making all of France a suburb of Paris, as Octave Feuillet wrote to Napoleon III in 1867.

This rigid centralization has continued to the present despite changes in forms of government and since the Restoration has met with much opposition and criticism. Politicians and parliamentarians, from Villèle, the royalist conservative deputy and minister of Louis XVIII, to Clemenceau, Briand and Poincaré, have put forward various proposals to counteract centralization. Writers and philosophers like Auguste Comte and Alexis de Tocqueville have attacked it in their works. Such radically different writers as the Catholic conservative economist Le Play, in his *La réforme sociale en France* (2 vols., Paris 1864), and the bold anarchist and federalist Proudhon, in his *Du principe fédératif* (Paris 1863), were vigorous opponents of centralization.

The vague desires for decentralization during the 1860's found expression in the then popular "Nancy Program," which demanded that communal matters be regulated by the commune, regional affairs by the region and national by the nation. The works of two Orleanists, Prévost-Paradol's *La France nouvelle* (Paris 1868) and Duc de Broglie's *L'ue sur le gouvernement de la France* (written in 1861 but not published until 1870 in Paris), received wide attention. Both writers demanded local self-government. Duc de Broglie advocated the reestablishment of the provinces, while Prévost-Paradol was the first French writer to introduce the concept of "regional assemblies," to be formed from the *conseils généraux* of several *départements* and to be based on geographic and economic considerations.

The law of 1871 concerning *départements* and the municipal laws of 1884 and 1890 marked steps toward decentralization. Paul Deschanel in his *La décentralisation* (Paris 1895) made a plea for the transformation of the French bureaucratic communal administration into corporate form, after the manner of the English and German systems, and for the "replacing of the activity of the officials by that of the citizens."

The cultural reaction against the domination of the French capital set in at a comparatively early date. There were many groups which lamented the disappearance of picturesque folk idioms, local industries and other provincial peculiarities and which aimed to reawaken the slumbering spiritual and cultural life of the various provinces. These currents are related to the movement to revive the various dialects of Provence, Brittany, Alsace and Flanders, the patois which for many decades had been very effectively counteracted by the centralized school system. Many independent local newspapers and periodicals of an outspoken regionalist character began to appear at the turn of the century.

The first important regionalist movement against Paris, however, arose in Provence. Provence had always maintained a proud and independent stand. The Provençal cahiers in 1789 had pledged its representatives to demand the right of self-government for Provence. This spirit animated the seven Avignon poets who followed the summons of Roumanille in 1854 and, calling themselves *félibres*, formed a union of poets with the clearly formulated purpose of reviving the Provençal language. Frédéric Mis-

tral, who soon became the leader of this group, succeeded in creating a new Provençal literary language based on the dialect of the lower Rhone valley. He compiled a large dictionary of the Provençal language, founded a museum in Arles and sought to widen the movement to include all of southern France. Gascony, Limousin, Auvergne and Dauphiné kept aloof from the movement, however, and its center remained in the valley of the Rhone.

The *félibristes*, looking upon themselves as the heirs of the troubadours, sought to restore the entire mediaeval culture which had flourished in the southern provinces and was now forgotten. They revived the singers' competition, chivalry, the *jeux floraux* and the *cours d'amour*; every seven years they chose a queen of the Félibrige, who placed a silver crown on the head of the master of the *gai savoir*, the *gaya scienza*, the "happy science," of the troubadours. The romantic strain was at first predominant in the Félibrige, and the statutes of 1876 distinctly prohibited "political and religious discussions" at meetings.

The recognized master, Mistral, did, however, introduce a political note in his *Calendau*, which appeared in 1867. In a famous note to this poem he lamented the subjection of the much more cultured south by the "barbarians" of the north and above all the fact that this fusion of north and south went beyond the stage of an *état fédératif*. In another place Mistral declared his political ideal for France to be an *état fédéral* with all the modifications made necessary by modern conditions. His position was directed not against France or against unity but "rather against the system of extreme centralization carried on by the state officials with such shocking rigidity."

The Félibrige became increasingly political. An École du Félibrige came into being in Paris. The young *félibristes* (Frédéric Amouretti, Charles Maurras, Auguste Marin) issued a declaration on February 22, 1892, in which they demanded "freedom of the communes" and declared their aim to be "the liberation of the soul of the provinces from their departmental prison." "We are autonomists, we are federalists," they announced, "and if any people of Northern France want to go along with us, we stretch out our hand to them. . . ."

Similar movements soon arose in other regions of France. In Besançon, Franche-Comté, Charles Beauquier in 1869 founded a weekly, the *Doubs*. He published a dictionary of the

provincialisms of his homeland in 1881, issued a collection of folk songs in 1894 and undertook the larger task of publishing a collection of the popular traditions of Franche-Comté. Beauquier also made many proposals during the years between 1890 and 1910 for a new administrative division of France.

Charles Le Goffic was the leading spirit in the founding of the Union Régionaliste Bretonne. In his *L'âme bretonne* (Paris 1902) he revived the customs, songs and legends of Brittany and its ancient historic traditions. Maurice Barrès became as famous for Lorraine as Mistral was for Provence. The most powerful source of national energy, according to Barrès, was to be found in the local homeland, the "region." In his *Les déracinés* (Paris 1897) he presented a brilliant development of these ideas. He called for regional universities and for a system of elementary education which would be expressive of the individual character of the various regions. "There are," he said, "Lorraine, Provençal and Breton truths." An opponent of division into *départements*, he demanded the reorganization of France into larger administrative units, either regions or provinces. He called for "regional assemblies" and local parliaments which would regulate the details of local administration.

Under the influence of the geographer Vidal de la Blache a series of doctoral dissertations on the different regions of France were published. The *Revue de synthèse historique* put out a series of studies, *Les régions de France*. Similar regional monographs were published in the *Annales de géographie* and in the *Bibliothèque régionaliste* of Frédéric Charpin.

In 1900 all the currents opposed to excessive centralization in France were united and organized in the Fédération Régionaliste Française (F. R. F.). Charles Brun, one of the leaders of this organization, has declared on numerous occasions that its aim was a federal state. Since the time of the Girondists, however, the word federalism had acquired a disreputable connotation and, as Proudhon pointed out, became almost synonymous with treason. It was for this reason that the founders of the F. R. F. did not dare to commit themselves openly to federalism, preferring to call their paper *Action régionaliste*.

The F. R. F. soon went beyond the sentimental regionalism of the poets. It sought to replace the artificially constructed *départements*, which had become outmoded in the new age of the railroads and the automobile, by larger

homogeneous regions which were to be administrative and judicial districts, economic provinces with regionalist universities as the seats of a regional intellectual and cultural life. Jean Hennessy, who has been president of the Ligue de Représentation Professionnelle et d'Action Régionaliste since its formation in 1913, has been active in behalf of economic, political and administrative regionalism.

The success of the movement is attested in the fact that the service branches of the mines, the water supply and the forest administration and of the postal system are today regionalized. The administrative reform of 1926 replaced the *arrondissement* courts by 131 *département* courts, the jurisdiction of each comprising several *arrondissements*. One hundred and six subprefects were removed; the prefect councils of the *départements* were abolished, being replaced by 22 regional administrative courts, small state councils which may be called upon for judicial advice. An interesting and important decree was that of November 5, 1926, which permitted the *départements* to form *syndicats*, or corporations, created for specific purposes, with more far reaching powers than those possessed by the Commission Départementale set up in 1871.

The importance of French regionalism today lies chiefly in the economic sphere. Le Play had based his proposals for social reform on economic considerations and had laid great stress on the agricultural and industrial homogeneity of the new administrative units which he proposed to create. In a similar way Vidal de la Blache undertook to work out a plan for seventeen industrial regions. In 1898 Jean Jaurès declared that "the growth of Paris would be illusory or dangerous unless the economic activity were diffused all over the country." Men of all parties have pointed out the general neglect of the economic needs of the provinces. Charles Maurras showed that Paris received the best agricultural and industrial products from all over the land. The French railway system no longer fills modern requirements. All the lines converge to Paris and there are no adequate connections between the provincial systems. There are no fully developed ports, because the hinterland is not organized sufficiently. Before 1924-25 there were no industrial and agricultural chambers. The Bank of France has collected almost all the savings of France in Paris and a large part of this capital is invested in foreign enterprises. Hennessy and Jean Buffet in his book *Du régionalisme au nationalisme financier*

(Paris 1917) call for regional banks to supply capital for great economic enterprises, which in turn will improve the existence and enhance the value of the regions.

With the World War the regionalist problem emerged from the sphere of congresses and debates into reality. The burning questions concerning the destroyed but once most productive regions of the northeast, the amalgamation of Alsace-Lorraine and the whole problem of economic reconstruction all pressed more urgently for solution and regulation.

Henri Hauser, in his excellent study *Le problème du régionalisme*, points out the amazing and significant contrast of the war situation with that of the period of the revolutionary wars or of the War of 1870-71. During the World War, despite the need for the most intense concentration of all powers and notwithstanding certain forms of economic dictatorship, there was a recrudescence of local initiative and independent activity which France had not seen for a long time. Whereas during the years 1870-71, at the time of the enemy invasions, the prefects, mayors and local assemblies hardly dared to act without instructions from Paris, the situation in the fall of 1914 was quite different. Apart from the occupied areas the natural connections between many parts of France and the capital were destroyed, and Paris itself faced the danger of enemy occupation. The various regions, left to their own resources, engaged in spontaneous and effective activity; they cared for the needy, sheltered the wounded and fugitives and created jobs for the unemployed. Municipalities, local boards and all kinds of organizations shared the responsibility almost equally.

On October 25, 1915, the premier, Viviani, and the war minister, Millerand, issued a decree authorizing the establishment of a Comité Consultatif d'Action Économique in every army corps region of the inner zone; such committees were to function during the whole war period. This innovation was along the lines of the reforms long urged by the advanced regionalists, notably Jean Hennessy. These economic committees had a double task. Their military function was to keep the war administration informed of the conditions of production in the various regions. In addition they were to use all available means to increase production and counteract the tendency toward increased prices. This development was, as Hauser says, only a "timid regionalism," but the committees advanced definitely toward independence and

made practical and successful contributions during the war to land cultivation, transportation and problems of food and coal supply. So well did they preserve their status, although they varied in significance and degree of influence, that there was a strong tendency to retain them even after 1918.

This tendency paralleled the movement led by the minister of commerce, Étienne Clémentel, which aimed to divide France into economic provinces. This plan was related to the law of 1898 regulating the powers of the chambers of commerce. The all too numerous and often feeble chambers of commerce were to be grouped anew on a regional basis. On February 28, 1919, when their activity was about to cease, the economic councils were transferred from the supervision of the War Ministry to that of the minister of commerce. On April 5, 1919, a decree empowered the chambers of commerce to set up seventeen chambers of commerce districts, or economic provinces (*régions économiques*). The chief cities of these regions were Lille, Amiens, Rouen, Caen, Nantes, Rennes, Limoges, Bordeaux, Toulouse, Montpellier, Marseille, Grenoble, Lyons, Nancy, Paris (with two regions) and Clermont-Ferrand. The economic committees were incorporated into the *régions économiques* on April 6, 1919.

The economic committees indeed gradually lost the significance they had possessed during the war. In every economic province a Comité Régional des Chambres de Commerce was set up over the existing advisory committee. This became the actual economic organ of the region and it pushed the older institutions into the background. The new regional committee and its general secretary acquired far reaching rights of economic initiative. Together with the central government such committees were to attend to such questions as the building of harbors, canals and local railroads, the utilization of land, the betterment of working conditions and the like.

This reform in the classic land of administrative centralization signalized a decisive victory for the regionalist idea. The socialist Georges Renard expressed the hope at the time that these new regions would become "organic elements of national existence" and that no longer would important matters of local concern, such as the construction of branch line railroads or provision for filtered drinking water, be decided by a few deputies in the Chamber, quite ignorant of the problems involved. The overburdening of

the French Chamber of Deputies with detailed and local questions has often been lamented and constitutes one of the motives behind many of the proposals for regionalist reforms.

Regionalist tendencies are to be found in the most varied political camps of contemporary France. Clémentel once said that "regionalism is the organization of democracy," but men whose ideal is quite removed from bourgeois democracy also subscribe to it. On the one hand there are the revolutionary syndicalists who, recalling Proudhon and the bold experiment of the Paris Commune of 1871, wish to organize new regions out of the federation of communally constituted *syndicats*. On the other hand there are the monarchist leaders of the Action Française, such as Charles Maurras and Léon Daudet, who embody all the reactionary, militaristic and ultranationalist tendencies and who find the ideal form of government for France in a romantically transfigured *ancien régime* with a "free church" and free communes and provincial estates.

The regionalist movement has also caused some stir in Corsica, in Béarn and particularly in Brittany; this last region has at times tended toward the development of a rather ridiculous separatism. The language question also plays some role in various districts, as, for example, in French Flanders. The most difficult situation exists in the three departments of Moselle, Haut-Rhin and Bas-Rhin and particularly in the two latter, where, according to Gooch, "sentimental" and "administrative" regionalism, especially as related to the language question, are closely linked. The Alsatian autonomist movement, based on strong local feeling, is directed chiefly against the rigorous manner in which the French language has been introduced in the schools and for official usage. It represents a type of cultural regionalism, although in Alsace there is also a strong desire for self-government and centralization seems particularly oppressive.

Next to France, Spain is the land in which regionalism is of the greatest moment, especially in Catalonia. Catalan regionalism goes back to the period between 1100 and 1162 when Barcelona was a city-state similar to the Italian republics. This fact, however, is of significance only as a historical tradition. During the reign of Philip IV (1621-65) there was a separatist revolt in Catalonia, which recognized the sovereignty of Louis XIII of France. During the wars of the Spanish Succession the old desires of republican independence were again revived and Barcelona

was encouraged to follow an independent policy. The treaties of Utrecht and Rastatt (1713-14), however, put an end to Catalan independence. In 1710 the *Decreto de nueva planta* did away with the special privileges accorded to the Catalan language in the law courts as well as with many other privileges of the Catalans.

At the beginning of the nineteenth century Catalan national consciousness was virtually extinct. Catalan criminal law had disappeared in 1822, the Catalan language had been abolished in the schools in 1825, the commercial law was discarded in 1829, separate courts in 1834, coinage rights in 1837 and regional administration in 1845. In 1834 Spain was divided into forty-nine provinces, each with a civil governor at the head, after the fashion of the French *départements*, so that the old historical provinces lost all significance. The constitution of 1845 then completed the process of centralization after the French model. The crown, the ministries and the state council exercised virtually all the power and they named the provincial and municipal administrative bodies.

In 1833 there developed the movement which sought to bring about a *renaixença* of Catalan culture. It began with an insignificant episode: Aribau, a Catalan employee of a Madrid bank, wrote an ode in the Catalan language in honor of his employer's birthday. This ode was published in the Barcelona paper *L'apor*, which together with *Europeo* became the organ of the romantic regionalist movement in Spain. Its leaders sought to revive Catalan culture, but they did not believe in the possibility of reviving the Catalan language. The revival of the Catalan language must be credited chiefly to the work of the scholar Rubió y Ors, who occupies a role in Catalan regionalism similar to that of Mistral in the Félibrige movement.

In 1859 the town council of Barcelona revived the old festival of *jochs florals*. In the 1860's a Catalan press was inaugurated with the publication of *Un troç de paper* and a literary review, *Gay saber*. At the same time Frederico Soler sought to restore the Catalan theater. Paralleling the development in France, Catalan cultural regionalism paved the way for a political movement. According to Salvador de Madariaga, Rubió y Ors did more for the "political rebirth" of Catalan nationalism than any other individual. It is difficult to draw the line here between regionalism and federalism. According to Madariaga, Catalan regionalism is "in the narrower political sense" an "offshoot of federalism."

In the first Spanish Republic of 1873-74 federalist problems played an important role. The Cortes of 1873 elected as president a federalist, Orense, who proposed a federal constitution like that of the United States, which was to divide Spain into autonomous states. The federalist delegates could not, however, agree on the size of these states. The majority wanted to reconstitute the old provinces as states, while the minority held out for smaller states consisting of only one city or canton. The prime minister, Pi y Margall, was a disciple and translator of Proudhon and therefore inclined toward the idea of cantonal autonomy. His followers were mostly urban workers who were either socialists or anarchists.

Pi y Margall himself was a Catalan and a representative of the union of Catalan regionalism with the more general federalist tendencies which have appeared in Spanish history. Valentín Almirall, originally a follower of Pi y Margall, departed from his mentor in laying greater stress upon the development of a regionalism which should be specifically Catalan, divorced from the more general Spanish federalist movement. With his book *Lo catalanisme* he became the founder of the left republican wing of the Catalan regionalist movement. He edited the newspaper *Estado catalán*, which was published in Spanish; in 1879 he followed with *Diari Català* and in 1882 he founded the Centre Català, whose purpose was to further the Catalan idea and whose membership was drawn from the most diverse political tendencies.

The regionalist movement in Catalonia is as variegated as that of France. "Clericals and anti-clericals, Catholics and free thinkers, men of the right and men of the left . . . reactionaries and liberals . . .," according to Madariaga are participants. The bishop of Vich, Torras y Bages, with his *Tradició catalana* (Barcelona 1892), represents the Catholic right wing. For Almirall Catalonia signified "progress, free thinking and democracy," for Torras y Bages, "faith, order and above all tradition." Neither of them, however, has regarded Catalonia as a nation.

Enrique Prat de la Riba represented a decided step in this direction. To him Catalonia was a nation. His ideal was a federation of all Catalan speaking regions—Valencia, Balearic Islands and Catalonia proper. Although his ideas marked an advance over the older romantic regionalism, Prat did not abandon romantic dreams completely; indeed he hoped for the inclusion of the Catalan speaking districts of France. For Spain

he desired an Iberian federation with greater Catalonia, Castille and Portugal as the confederate states. Until his death Prat was the undisputed spiritual leader of Catalonia; the present leader, Cambó, is his disciple.

The Centre Català, founded by Almirall in 1882, could not permanently hold together the entire Catalan regionalist movement. Another branch of the movement developed, more moderate in political outlook aside from the Catalan question; it founded the Lliga de Catalunya in 1887 and a newspaper, *Renaixença* . The Lliga became the most important instrument of the Catalan movement.

In 1892 the assembly of Manresa was convened and a list of Catalan demands was drawn up, which has come to be known as *Las bases de Manresa*. Spain was to be reorganized on a federative basis and Catalonia was to retain control of all branches of internal administration, including the right of coinage and military powers. The federal government was to direct all matters common to the federal states: defense, foreign policy, interstate communications and tariffs. The expulsion of non-Catalans from all public offices in Catalonia was also demanded.

While theoretical questions and programs of action which could scarcely be realized at the time were being discussed at the assemblies of Reus (1893), Balaguer (1894) and Olot (1895), Catalonia was shaken between 1892 and 1896 by a series of anarchistic outbreaks. Furthermore with the signing of the Peace of Paris in 1898 Spain lost the remainder of its colonial possessions. Out of the crisis which followed this defeat all the political parties emerged in different forms.

At the turn of the century Catalan regionalism entered a new stage. The Centre Nacional Català and the Unió Regionalista combined, scored a victory in the elections of 1901 and soon thereafter were amalgamated into the Lliga Regionalista. The leaders of this important Lliga were Prat de la Riba and the jurist and politician Cambó. The "radical," anticlerical, bourgeois revolutionary and republican forces in Catalonia were headed by Alejandro Lerroux.

In the new Spanish Republic the demands of the Catalans, Galicians and Basques for autonomous administration of their affairs in the fields of culture and education, public works, transportation, justice and police have played a significant role. The Catalan state president, Macià, originally an extreme separatist, toned down con-

siderably his earlier bold demands for independence. The "Catalan Statute" put through by him in September, 1932, is very moderate. The Catalan republic was proclaimed a few hours before the Spanish Republic. But the Generalidad de Cataluña, which has been called "something between a state and merely a functional league of provinces" or a "sort of glorified county council," is really no state at all, despite the fact that it entered into an agreement with the Spanish state as an independent party. According to the statute, Catalonia may regulate its own educational system; it also possesses certain civil legislative powers and its own municipal administration. Spanish and Catalan are both recognized on a basis of equality as the languages to be used in the schools and in the administration. Catalonia is to carry out the laws of the central government, which retains command of foreign policy, defense, the right to declare war, as well as the imposition of indirect taxes and duties.

The Basque inhabitants of the provinces of Álava, Vizcaya and Guipúzcoa, like those of Navarre, have maintained a separate existence in the Spanish monarchy for a long time. The king was only the *seigneur*. The Basques governed and administered their own affairs and did not pay taxes or render military service; their country lay outside the Spanish customs border. These privileges were known as the Basque *fueros*. During the Carlist War (1834-39) the Basques in their struggle for the absolutist ruler rallied to the cry, *Paz y fueros*. The temperament of the people, the topographical peculiarities and the influence of the church have served to preserve the inclination to separatism; the local church was not in the least anxious for the spread of the Castilian language.

At the beginning of the twentieth century, when the Catalan movement had just reached its apex, an enthusiastic Basque student, Sabino Arana-Goiri, was studying in Barcelona. When he returned to Vizcaya he sought to arouse a particularist movement in his homeland. He wrote *Biscaya por su independencia* (in Spanish, Bilbao 1892) but died at an early age in 1903 without having attracted any appreciable following. Three years after his death the nationalist Basque party was founded in Bilbao. It declared itself for "the tradition, the church, the ancient laws and institutions of the land, language and art of the people." Spanish industry, banking, the technical world and particularly the professions are filled with men of Basque origin who consider Basque nationalism an aberration

In economic circles too this nationalism arouses almost no respect, although one of its most energetic benefactors is a well known steel magnate of Bilbao. The desire for autonomy, however, is recognized and the Basques are responsible for the creation of the most progressive communal and provincial administration in Spain.

The Galician movement represents primarily a revival of a forgotten language and culture. Galician is closer to Portuguese than to Spanish. Castilian poets, up to the fifteenth century, often chose the Galician language for their lyrics. Galician was discarded then as was the Catalan tongue, and it became the language of the lower classes. Today, on the other hand, the Galician verse of Rosalia Castro and the Catalan poetry of Maragall represent the best lyric expression of nineteenth century Spain. At the opening of the twentieth century language societies, such as the Irmandades da Fala, were formed with a view to reviving Galician as a cultural tongue. A Seminario de Estudios Gallegos is still in existence. Some of the leaders look upon the old University of Santiago de Compostela as the future center of a new Galician culture.

In Italy regionalism has played a modest role. Here too it often appears as a mild form of federalism. Thus at the time of the Risorgimento the neo-Guelphian school represented by Gioberti maintained that Italy should be a federation of states headed by the pope. Cattaneo, elaborating on the ideas of Dante, looked toward a strong federation (*lega di stati*) under the presidency of an emperor, while the revolutionary republican Ferrari advocated a loose republican federation. Mazzini in 1861 published a pamphlet, *L'unità italiana*, in which he advocated the formation of twelve regions. Montanelli followed with *Dell'ordinamento nazionale* (Florence 1862). In these and similar writings of republicans the discussion no longer centers about the creation of a confederation, but rather the establishment of local administration in a unified Italy.

When in 1859 the Sardinian monarchy assumed the administrative organization of the newly won territories (Lombardy, Emilia, Sicily, Umbria), powerful voices were raised in behalf of administrative regionalism, and legislative measures to that effect were introduced into Parliament. The minister of the interior, Farini, entertained such plans and his successor, Minghetti, was strongly in favor of such ideas. An opponent of French centralization, although

he objected also to imitation of the American or Swiss constitution, he advocated the combination of a strong unitary policy with good local administration. He thought that self-sustaining regions should hold the balance between the old historical provinces and the new territorial entities created by the government and should assume fairly far reaching powers of self-government.

Despite Minghetti's proposals and others a system of centralization, modeled on the French, made headway. Such a system, it was hoped, would be better able to consolidate the union and overcome the particularist aspirations in the annexed regions. The fifty-nine—after the acquisition of Venetia and Rome sixty-nine—provinces were fashioned along the lines of the French *départements*. The local officials, governors and syndics, appointed by the central government, correspond to the French prefects and mayors.

Centralization remained practically unchanged in Italy until the late nineteenth century. With the advent of the left to power in the 1880's and 1890's individual proposals like those of Crispi were put forward. These also dealt with the problem of a new grouping of the provinces, but they had no concrete results. Many scholars and politicians of the period, such as Bertolini, Marchetti and Calenda di Tavani, published monographs on the problem of regionalism. Saredo, in his commentary to the communal and provincial law (6 vols., Turin 1890-98), recommended the creation of regions based on geographic, historic and social factors.

The problem of regionalism did not come to the fore again until the eve of the World War, when the voice of a republican was raised in its favor. In his *Decentramento politico e amministrativo* (Rome 1914) Macaggi introduced the proposition that the Italian Parliament was overburdened with questions of detail. Like many in French democratic and republican circles, he declared the monarchy, hampered as it was by historic tradition, to be incapable of decentralization. He was aware of the fact that even republican France also suffered from an overdose of centralization, and he cited the reform projects of Leroy-Beaulieu and Briand. His own regionalist proposals were more emotional in character and were not elaborated in any detail.

There was a revival of regionalist feeling in Italy after the World War. This was partially a reflection of the fact that the newly annexed regions, which under Austrian rule had en-

joyed a marked degree of self-government, did not allow themselves to be incorporated without friction into the centralized system. Two tendencies may be distinguished during this period. One was represented by a Catholic peasant party, which maintained that agricultural interests could best be preserved in a regionally administered system. Traces of the neo-Guelph party were continued in this party, although a strong regionalist program was never formulated. Much less significant was the second tendency, called "insular" or "Sardinian," which created a stir for a short period. It was a sort of reactionary federalism similar to that in Brittany and the Basque provinces. A population cut off from the great stream of modern ideas by its geographical position desires to preserve its old physiognomy and hopes to realize this in a region with a definite political status. When the proponents of such theories were reminded that these far from economically prosperous regions could not exist without the help of the central government, they reduced their demands, advocating merely an administrative regionalism which would divide the tasks of state and region somewhat along the lines of the old program of Saredo. Later these demands were still further modified; the object now was decentralization rather than regionalism. In the parliamentary debates of February 26, 1921, a demand was made for local officials with the necessary powers to maintain a system which may be designated as deconcentration. In the completely centralized Fascist system, however, there is no room for true regionalism.

The United Kingdom has had to face problems which have been considered as aspects of federalism: the Scottish autonomy movement and the Irish question. On the other hand, certain of its problems have been compared to those of French regionalism. Here the prime desideratum was to lift the burden of government from the central Parliament. This problem had already occupied public attention at the time of Gladstone, who, in inaugurating the so-called committee system, had transferred certain powers from the plenum to committees. In the meantime another solution was proposed. The Irish, seeking to utilize the separatist tendencies of the Welsh and the Scotch for their own home rule, issued the slogan of "Home rule all round." According to this plan certain functions of the central Parliament were to be transferred to the nationally constituted governments of Ireland, Scotland, Wales and England. Had

this system been realized, the United Kingdom would have been transformed into a confederation of states.

At the Conference on Devolution of 1920 Murray Macdonald represented the system of national devolution, or complete devolution, which was identical with that of "home rule all round." Separate parliaments, to be elected in England, Scotland and Wales, were to be "subordinate to, but separate from the parliament of the United Kingdom." A counter proposal was presented by Lowther, who advocated the setting up of grand councils in England, Scotland and Wales "consisting of a Council of Peers and a Council of Commons, the latter to be composed of all the members returned to the House of Commons to sit for the constituencies in that area." Herman Finer subsumes under the problem of devolution the narrower one of regionalism as "devolution to locally elected bodies, in large, non-national areas, coincident with certain districts on which industrial, commercial, agricultural, transport and social factors impress an unity of interests." Finer holds that no appreciable diminution of the burdens of Parliament would result, "for the services which could be regionalized would save practically no time, while those which would save time could not possibly be regionalized."

In the United States regionalism has really never appeared. Such sectional manifestations as have occurred in the history of the country from time to time—the threat of New England to break away from the union in 1814, the secession of the southern states in the Civil War, the alignment of the agrarian west and south against the industrial east in 1896—were the results of economic antagonisms rather than consciously held regionalist philosophies. Certainly as far as tradition, culture and language are concerned, if the small, occasional and temporary islands of immigrant settlement are excepted, the United States has always presented the aspect of a unified nationalist grouping. Efforts have been made, however, to foresee the future development of the United States along regionalistic lines, notably by the historian Frederick J. Turner, whose theory of sectionalism is in effect a regionalist approach. Thus in 1925 Turner wrote: "The significant fact is that sectional self-consciousness and sensitiveness is likely to be increased as time goes on and crystallized sections feel the full influence of their geographic peculiarities, their special interests, and their developed ideals, in a closed and static nation."

He even went so far as to say that "economic interests are sectionalized." Aside from a small southern literary coterie, which has sought to redirect southern life into the old and abandoned pre-Civil War channels, there has been but slight substantiation of Turner's prediction.

The new state of Poland has also been confronted with what may be termed regionalist problems. The present day administration of Poland with its *województwa*, *starostwa*, mayors and communal representatives is very similar to the centralized system of France. The provisions for the autonomous administration of the *województwa*, districts, towns and village communities have not yet been made uniform. The Polish regionalist movement, like that of France, is of romantic origin and goes back to Adam Mickiewicz (1798-1855) and the Philomates, that enthusiastic circle which flourished in Vilna, Nowogródek and Lithuania. Stanisław Witkiewicz and Kasimir Tętmajer, on the other hand, sought to make Podhale, the northern slope of the Tatra Mountains, into a Polish "I."

Tętmajer's *Na skalnem Podhalu* (In rocky Podhale, 5 vols., Warsaw 1904-10) and Witkiewicz' *Na przełęczy* (On the pass, Warsaw 1891) are the classic expressions of this Tatra regionalism. Cultural regionalist demands analogous to those of Mistral and Barrès are also to be found in contemporary Poland. The school should cultivate the characteristics of the narrow regional homeland and direct its efforts toward the development of a natural patriotism rooted in the soil. Art and science are to draw their sustenance from the locality. A Biblioteka Regionalna and regional museums are highly. In Poland too a regionalism with administrative and economic aims has developed out of this cultural regionalism. Zborowski, director of the Tatra museum in Zakopane, has set up a program which, while it does not infringe upon the unity of the state administration, demands decentralization and self-government at least with regard to cultural and economic activities and the administration of justice. The problem of the revision of the map has also emerged in Poland in connection with changes in district boundaries. Since 1926 there has been a demand for economic regions differing in type according to their location, population and culture. Regional commissions of *województwa* have studied in detail the possibilities of regionalist reforms and have become particularly active in Lublin and Warsaw.

In Germany the movement which has been

called regionalism during the last decade had still another orientation. Here the aim was not to minimize the effects of state centralization but rather to reorganize Germany on a new economic, geographical, cultural and social basis, without too much concern over the boundaries of the old federal states. The German regionalist movement sought to pave the way for the German unified state. This is evident in Apelt's book *Vom Bundesstaat zum Regionalstaat*, in which the regional state is depicted as an intermediate stage between the federal and the unified state. In 1926 the national committee of the Republikanischer Reichsbund convoked a congress of leaders and issued a noteworthy memorial entitled *Welche Wege führen zum deutschen Einheitsstaat?*. In German republican and democratic circles as well as in the columns of the *Sozialistische Monatshefte* the question of state regionalism was connected with that of the organization of Balkanized Europe into a customs union and a community of nations. These projects together with the proposals of French regionalists like Jean Hennessy, Charles Brun, Lucien Coquet and the European aspirations of the Alsatian René Schœckle justify Gooch's characterization of regionalism as a manifestation of world federalism.

REGISTRATION. See STATISTICS.

REGISTRATION OF LES. See LAND TRANSFER.

REGISTRATION OF VOTERS. The purpose of registration of voters is to prevent voting frauds. The requirement that all electors wishing to vote shall be registered prior to the election makes it possible for party workers or, if the state laws so provide, for election officers to investigate their residence and other necessary qualifications. In rural communities and small municipalities, where the election officers are usually acquainted with the voters, there is little need for registration; but in large cities, where the election officers cannot be expected to know all the residents of the precinct, it is essential. In the United States it was common in some cities before the adoption of registration systems for corrupt party organizations to employ "repeaters," who on election day went from precinct to precinct voting under fictitious names and sometimes from fictitious addresses.

The first registration law in the United States was enacted by Massachusetts in 1800. The assessors were required under this act to prepare a list of qualified electors, which was posted and revised prior to each election. Other New England states adopted registration laws within a few years, but most of the states elsewhere did not provide for registration until after 1850. New York, for example, enacted a registration law in 1840 applying to New York City, but repealed it two years later and did not again require

registration until 1859. Pennsylvania enacted a registration law for Philadelphia in 1836 and for the entire state in 1869. Most of the early laws were defective and did not put a stop to voting frauds. In Pennsylvania, for instance, gross election frauds prevailed in the large cities prior to the adoption of a compulsory, personal registration law in 1906.

At present only two states, Texas and Arkansas, do not provide for registration; they do, however, require the payment of a poll tax for voting, and the lists of poll tax payers are sent to the polls and serve somewhat as a registration. In many of the other states registration is not required for rural districts and cities with less than a designated population. In some there is a special registration law with a simpler procedure applicable to rural districts and small cities.

Registration systems in the United States differ widely from those in other countries. In the former the work is ordinarily performed by special election officers, often by a special registration board for each voting precinct, to which the voter is required to apply in person; in other countries registration lists are customarily compiled by some public officer or committee, from assessment and police records, and without personal application by the voter. In England the registration lists are compiled annually by the assessing officers and after being duly published by the town clerk are corrected by the revising barrister of each of the electoral districts, who holds hearings for this purpose. In the dominions in general, however, special election officials prepare the registers of voters. In France (except Paris, which has a somewhat different system) the lists are prepared by a special board in each commune (or in each election district, if there is more than one in the commune), consisting of the mayor (or, if a district, an adjoint designated by him), a member selected by the municipal council and a third member appointed by the prefect. The necessary information concerning the residents is secured from the perpetual census which every commune maintains. After the list has been posted, a communal (or district) court of revision, composed of the registry board with the addition of two members selected by the municipal council, hears and decides protests against the omission or inclusion of particular names. Appeal is allowed from the decision of these courts and may be carried as high as the Court of Cassation; actually, however, few appeals are taken. In the German cities the lists of voters are compiled by the municipal

election bureau from the elaborate registration records maintained by the police. The list is kept up to date through information obtained from the police, reports of deaths and marriages and court decisions involving disqualification. Provision is made for hearing complaints regarding the lists and also, under exceptional circumstances, for allowing persons to vote even though their names are not on the register. Such permission, evidenced by a *Wahlschein*, is sparingly given, normally amounting to much less than 1 percent of the votes cast. Munich employs an elaborate system of self-registration which does not involve personal appearance but is managed through the distribution of blanks by the owners and superintendents of dwellings. The voters' returns, however, are checked against lists obtained from police records.

Registration laws in the United States are of several types. They may be classified as compulsory or non-compulsory, depending upon whether or not a person may vote even though he has not been duly registered prior to election day. Registration laws are usually compulsory, but in a number of states a qualified elector who has neglected to register may register and vote on election day. Ordinarily he is required to produce two or more witnesses to swear to his qualifications. Non-compulsory registration laws have been made necessary by court decisions holding compulsory registration invalid. The experience in several states indicates that this type of registration is subject to abuse in hotly contested elections.

Registration systems may also be classified as personal or non-personal, depending upon whether the voter is required to apply in person for registration. In large cities personal registration is the rule, but in a number of states the registration officers of each precinct are authorized by law to meet on a designated day and prepare a list of qualified electors of the precinct. In actual practise they usually copy the register used at the previous election, with the result that many names of persons who have died or moved out of the precinct are continued on the registers for years. Non-personal registration leads to padded lists and instead of providing a protection against voting frauds actually encourages them. It is supposed to be the most convenient type for the elector, who is registered without having to bother about it himself, unless he moves from one precinct into another, in which case it is necessary for him to ascertain that his name has been placed on the list.

Registration systems may be permanent or periodic, depending upon the frequency with which a new, general registration is required. Under a periodic system the existing registration lists are discarded and all voters are required to register again periodically (annually, biennially or quadrennially). The principal criticisms of this system arise from its cost and bother to the voters. Within recent years there has been a considerable movement toward permanent registration, under which the voter, once registered, remains so as long as he continues to reside at the same address. The voter is usually registered upon an individual record, consisting of a card or loose leaf form; if he changes his address within the same city he is permitted to transfer his registration to his new address, with less bother than a new registration would involve. The movement for permanent registration is indicated by the following list of states which have recently adopted it: Minnesota in 1923; Wisconsin and Iowa in 1927; New Jersey in 1928; Michigan and Ohio in 1929; Kentucky and California in 1930; Washington in 1932; Indiana in 1933. Permanent registration bills have been introduced in a number of the other states within recent years, and the movement will probably continue to spread.

A great deal of criticism has been raised against the existing periodic registration systems, which are expensive, unduly troublesome to the voters and unsuccessful in preventing voting frauds. The annual cost of registration per voter in some cities with such systems averages nearly one dollar, while under permanent registration the cost has been about thirteen cents per voter in Milwaukee and only slightly higher in other cities. The average annual cost of registration per voter in some of the larger cities of the United States has been estimated as follows:

New York	\$.711
Philadelphia	.840
Chicago	.646
Boston	.554
Detroit	.223
Baltimore	.637
Cleveland	.763
St. Louis	.580
Milwaukee	.137
Kansas City	1.080
San Francisco	.423
Omaha	.260
Portland, Oregon	.134

Boston, Milwaukee, Omaha and Portland have permanent registration, while Detroit, Cleve-

land and San Francisco have adopted permanent registration since these cost statistics were computed. The high cost under periodic systems is caused by the necessity for carrying on a general registration of all voters every year or so, with a large number of precinct registration officers and with such incidental costs as rental of registration places, records, advertising and printing.

Permanent registration usually results in the registration of a somewhat higher percentage of qualified electors than do periodic systems. Other factors, however, such as the closeness of elections, the strength of party organizations and popular interest, are equally or more important in this connection. A detailed statistical study of the percentage of eligible electors registered under each system in comparable large cities shows that under permanent registration from 5 to 15 percent more voters register than under periodic systems.

Another criticism of existing registration laws is that they have proved ineffective in preventing voting frauds. Some of the most striking cases of frauds within recent years have taken place in Chicago, Philadelphia and Pittsburgh, each with expensive and cumbersome registration systems. On the other hand, cities with permanent registration, such as Milwaukee, Omaha, Boston, Minneapolis and Portland, Oregon, have had no election scandals for years. The most expensive registration systems may be the least effective in avoiding voting frauds. Many of the existing periodic registration systems are too well controlled by the precinct party organization; the voter is not identified at the polls by means of the signature; and the means for investigating and keeping the lists corrected are often defective.

The features which have been commonly adopted with recently enacted registration laws, and which may be looked upon as essential to a sound system, include the following: central registration at the election office of each city throughout the year; individual card or loose leaf records for each voter; provisions whereby the voter may send in a signed request for transfer; correction of the lists for deaths, transfers and failure to vote over a two-year period, with resort to a house to house check up when necessary; identification of the voter at the polls by his signature; and permanent registration.

REHABILITATION in recent times has come to have a specific meaning which relates it exclusively to disabled persons. In this sense it refers to the occupational reestablishment, with a view to complete or partial economic independence, of the physically handicapped and covers measures of every kind which tend to bring this about, whether they be therapeutic, psychological, educational or socio-economic.

The movement for rehabilitation has taken form largely within the present century. For generations the attitude toward the disabled had been one of aversion and neglect or of pity with its attendant almsgiving. With the increase in the number of disabled following the industrial revolution and the widespread introduction of machinery, social forces were called into being which undertook to cope with the problem. As early as the 1890's agitation on the part of the charity organization societies resulted in the establishment of a number of special bureaus for the employment of handicapped persons. Modern social work, an outgrowth of the charity organization movement, has through its case work approach continuously emphasized the policy of enabling the handicapped and dependent to become self-supporting. Other factors which hastened the development of a rehabilitation program were the rise of modern orthopedic surgery and the care of crippled children, which by the first decade of the twentieth century had advanced considerably on the hospital side and somewhat on the educational and vocational side. Workmen's compensation for industrial accidents, which had its origin in Germany in 1884 but did not take root in the United States until 1911, likewise directed public attention to the problem of the disabled. One of the secondary objectives of this movement was the search for methods of "reeducation" of injured workmen. The final influence serving to bring about a rehabilitation program was the World War. The attention given to the physical and vocational restoration of disabled soldiers and sailors

in all countries led to the inference that methods which could restore war victims to economic efficiency would prove equally effective in the case of victims of industrial accident and disease.

In the United States the result of these various trends was the passage of the vocational rehabilitation act of 1920, which established for the first time a nation wide governmental service for the economic reclamation of the physically handicapped. Prior to the federal act twelve states had on their own initiative enacted legislation providing for the vocational rehabilitation of civilians, but in only six had the laws begun to function. The federal act created an advisory service and to states engaging in rehabilitation work furnished aid in proportion to the population and contingent upon the expenditure by the state of an equal amount from public funds or private funds cleared through the public treasury. The amount of federal aid authorized is \$1,000,000 per year, but the actual appropriation and expenditure have never exceeded \$979,000 in any one year. The federal aid and the equal sum appropriated or raised by the states are expended for administration, for tuition and supplies and in certain cases for artificial limbs or appliances where such are essential to rehabilitation. These funds cannot be spent for personal maintenance of the disabled during their period of training or for physical restoration or permanent equipment. Within a year after the passage of the federal act twenty-five states had accepted its terms and by 1933 the number cooperating had risen to forty-five, with the District of Columbia as an additional unit.

In the majority of states the administration of the rehabilitation program is lodged in a division or bureau of the state board for vocational education, which quite generally is affiliated with or identical with the state department of education. The administrative agency on the federal side is the Federal Board for Vocational Education, which had been created earlier by the Smith-Hughes Act of 1917. The execution of the work is left to the individual states. In the District of Columbia a later act of Congress authorized a direct service by the Federal Board for Vocational Education. The scope of activity permitted the states by the act of 1920 is very broad. Those eligible for rehabilitation are "persons disabled in industry or in any legitimate occupation," a phrase which has been construed to mean "any person who, by reason of a physical defect or infirmity, whether congenital

acquired by accident, injury, or disease, is, or may be expected to be, totally or partially incapacitated for remunerative occupation." This definition includes victims of industrial and all other accidents; the victims of disease, such as children crippled by infantile paralysis; the tuberculous; the cardiac; the blind and the deaf; as well as persons suffering from congenital diseases, such as clubfoot and spastic conditions.

Rehabilitation work is largely in the hands of persons drawn from the vocational education field who in addition have had training or experience in vocational guidance and placement and in social case work. Unlike the educational program of a state, it is not accomplished by working with clients in groups. Each case receives individual treatment and a large amount of personal supervision. Sometimes physical reconstruction is the chief end, while again the aim is the restoration of morale. But at all times expert guidance is essential, for the training of the physically handicapped presents special problems in addition to the general requirements of vocational preparation. As a rule the staff member to whom a disabled person is referred retains charge of him until final occupational adjustment has been effected. He makes a diagnosis of the case, plans and supervises the vocational training, arranges any incidental or supplementary services which may be necessary and attempts to find remunerative employment for the disabled person. After placement a certain amount of follow up work is usually necessary. As the rehabilitation program has proceeded, increasing stress has been laid upon vocational training. Instead, however, of direct provision for this training by the state rehabilitation bureau, the accepted practice is to make contracts with existing training agencies. These include public and private vocational schools as well as many business and industrial establishments where so-called "employment training," or training on the job, may be arranged. In this way training for a considerable number of occupations is possible. In the only comprehensive study made of the occupations followed by rehabilitated persons, that of the Federal Board for Vocational Education published in 1925, it was found that 628 different occupations had been utilized in rehabilitating 6097 persons.

Because of the close cooperative arrangements with industrial commissions enjoined by the federal act a large proportion of those helped by the official rehabilitation agencies are industrial

accident victims. In the report of the Federal Board for the fiscal year ended June 30, 1932, they comprised 1709 out of the total 5550 who had been successfully restored to wage earning. The explanation lies in the fact that compensation cases are reported promptly, are usually assured of medical care and have an income which is often sufficient to assure the disabled person of maintenance while he is being trained. Of this total those disabled by disease during the year reported numbered 2159, those disabled by public accidents 1283 and the victims of congenital conditions 399.

When the type of injury is considered, leg disabilities are found to be the most numerous, constituting 2328 of the total number of cases in 1932. Hand disabilities numbered 569 and arm disabilities 419, or a total of 988 for the upper limb disabilities as contrasted with a total of 2640 for the lower limb disabilities, the latter figure representing the 2328 leg disabilities and the 312 foot disabilities. These statistics confirm the experience of rehabilitation workers as to the readiness with which the vocational adjustment of the various types is secured. Hand and arm disabilities are found to be the greatest handicap.

For the blind and the deaf separate activities have existed for many years. Rehabilitation work has therefore been of help to these groups chiefly through its flexibility of training and its readiness to experiment along new lines. The number of totally blind clients rehabilitated during the year ending June 30, 1932, was 104, of partially blind 277. There were 151 deaf and 155 partially deaf. Although the tuberculous are included in the definition of disabled persons, the number treated thus far has been negligible. Likewise cardiac cases while considered eligible have been represented to only a small degree. Because the scope of the program, both federal and state, has been restricted to permanent physical disabilities, the mentally handicapped have not been taken into consideration except in cases where a neurosis accompanies the physical affliction. Rehabilitation of war victims was in the hands of a special agency of the government under the Veterans' Bureau until 1926. Since that time any disabilities which persist or reappear are referred to the agencies serving civilians.

Occupational therapy, which has many points of contact with rehabilitation, has been valuable as a special service in reclaiming the victims of industrial accidents. Its usefulness was demonstrated during the World War, when disabled

soldiers in army hospitals were provided with light manual occupation, such as basketry, weaving, rug making and other forms of handicraft. This work, carried on under medical supervision, was at first diversional in character and later developed a practical prevocational significance. Although occupational therapy has a therapeutic rather than a directly economic objective, it has been of value in restoring the morale of disabled persons, in effecting functional improvement in orthopedic cases and in discovering aptitudes which could later serve as the basis for economic rehabilitation.

With the advent of the official federal-state service there arose a strong tendency to centralize all rehabilitation work in public agencies. In some instances private placement bureaus working for the rehabilitation of the crippled were discontinued. In others coordination with the state service was effected. As rehabilitation work increased in volume, the movement for local participation by cities and counties gained considerable support. Under this plan rehabilitation workers are engaged by the cities or counties, usually with some financial assistance from the state, and the program is conducted under the general supervision and with the cooperation of the state. Thus it has been possible to enlist the aid of a greater variety of cooperating agencies and to increase the number of disabled persons who are given care. In addition to the industrial commissions which refer the compensation cases the most active participating agencies in this local rehabilitation movement are the hospitals and schools for crippled children, which report their patients as rapidly as they reach vocational age, public health nurses, family welfare organizations and associations for the care of the tuberculous.

When a handicapped worker is considered with a view to placement, attention is given to his general qualifications, the nature of his handicap, his physical condition in other respects and his age. Another important factor is whether he is entering an occupation in which he has had previous experience or a new field for which he has been retrained. In some states placement is handled through the regular public employment offices, while in others it is a distinct service performed by the rehabilitation agency. Both methods are still in the experimental stage, and the results thus far obtained have supported the principle of treating the rehabilitation problem as a unit rather than as a number of separate services.

In the early years leaders of the rehabilitation movement believed that the increasing mechanization of industry would open up many new opportunities for the physically disabled. Experiments by a few large factories proved that in the limited operations favored by modern industry the handicapped could succeed quite as well as the able bodied. In general, however, employers hesitated to hire disabled workers because of the additional hazard to which such persons were exposed and also in most states because of the employer's liability under the workmen's compensation laws for complete disability benefit in the event of further injury.

That rehabilitation is closely related to social insurance developments in the United States as in other countries is shown by its place in the workmen's compensation movement and particularly by the references to it in the compensation acts of New York, Minnesota, Wisconsin, North Dakota and other states as well as in the federal Longshoremen's and Harbor Workers' Compensation Act. Experience has shown that rehabilitation is generally more effective in states where it is correlated with the workmen's compensation acts. In New Jersey, for example, the permanent disability award is discontinued after four hundred weeks if the worker declines to submit to such treatment as has been recommended by the state rehabilitation commission. In Oregon rehabilitation is made available to a larger number of industrial accident victims by the provision, under the workmen's compensation law, of living expenses for the injured person and his dependents during his period of training. New York, Wisconsin and Minnesota also provide special retraining benefits for the industrially injured.

The force which has urged and supported continuance of the federal participation is the National Rehabilitation Association, an organization of professional and lay persons interested in the vocational restoration of the disabled of all types. An active ally has been the International Society for Crippled Children. Other groups which have done effective work in promoting rehabilitation and government administration of programs include war veterans' organizations, trade unions and labor groups.

Definite statistics as to the exact number of the disabled for whom vocational rehabilitation is feasible are quite generally lacking. According to the Federal Board for Vocational Education the number in the United States, including victims of both accident and disease, ap-

proximates 84,000 annually. The total number actually rehabilitated by the official service since the beginning of the work is said to be about 55,000. It is evident therefore that unless a very considerable group are given care by private agencies or unless many more than generally supposed are able to make their own adjustment, a large number are still in need of assistance. It is significant that the majority of those who have been made self-supporting are between twenty and thirty-five years of age. In the experience of rehabilitation workers, while it is not impossible for a person who is disabled at fifty to be retrained, his chances of success are less than those of a younger man. Perhaps the best indication of the success of a rehabilitation program is a comparison of rehabilitated and non-rehabilitated workers in terms of their earning power. That the former group has a distinct advantage over the latter is evident from the following table, which is a summary of a nation wide study of 6400 rehabilitation cases made by the Federal Board for Vocational Education in 1927-28:

	Skilled	Unskilled
Average wage before disabled	\$28.85	\$19.71
Average wage after disabled	4.92	5.15
Average wage in rehabilitation job	26.61	22.10

In general the difference between the system of rehabilitation prevailing in the United States and the system in European countries is that the American plan contemplates governmental action and administration with incidental cooperation from private agencies, while in Europe the method followed is work by private agencies with governmental subsidies. The first country to adopt a policy of rehabilitating cripples under public auspices was Belgium. A school opened at Charleroi in 1908 was doing effective work when the World War broke out. In 1914 a similar institution, the École Joffre, was established in France at Lyons and later became the model for other schools in that country and elsewhere on the continent. At the present time France is the only nation that has followed the United States in establishing a governmental agency for rehabilitation—the École de Rééducation Professionnelle des Mutilés operating under the Ministry of Pensions, which has charge of the war disabilities. An interesting feature of the French law is that it makes vocational training compulsory for any persons who have suffered amputation and who are also eligible for a military pension. The effect of this requirement

is to induce many cripples who might otherwise remain pensioners or become public charges to take advantage of vocational training and eventually become self-supporting.

The organization which has general charge of rehabilitation in England is the Central Council for the Care of Cripples. Assistance from public funds is available for training under the Education Act of 1921. In the Scandinavian countries the existing system was brought about largely through the efforts of the Danish clergyman Hans Knudsen, who in 1872 began a movement which embodied all of the recognized principles of modern rehabilitation. Today these countries have well organized rehabilitation services, which for the most part are in the hands of private organizations and institutions subsidized by the government. Before 1914 Germany, like Belgium and Sweden, had already made considerable progress in the development of a system of vocational training for the disabled. The pressure of the war and the need for retraining soldiers caused the movement to expand rapidly and to become coordinated with civilian rehabilitation. At the present time Germany has the advantage of a statute which makes it compulsory for employers to hire a fixed percentage of physically handicapped workers, a system which of course presupposes and is based upon a careful plan of vocational guidance and training.

Rehabilitation depends for its successful accomplishment upon public support. Together with accident prevention and workmen's compensation it is an essential factor in overcoming the disabling effects of modern industry. The future of the movement, however, rests not so much upon its own expansion in terms of government expenditures and successfully rehabilitated cases as upon the solution of the larger problem of unemployment.

Kratz, *Bulletin*, no. 120 (1927), "A Study of Rehabilitated Persons" by Tracy Copp, *Bulletin*, no. 132 (1928), and "Workmen's Compensation Legislation in Relation to Vocational Rehabilitation" by F. J. Clayton, *Bulletin*, no. 126 (1927); Copp, Tracy, "Gains in Vocational Rehabilitation" in *American Labor Legislation Review*, vol. xvii (1927) 79-86; "Rehabilitation of the Wounded," ed. by Carl Kelsey, in *American Academy of Political and Social Science, Annals*, vol. lxxx (Philadelphia 1918); Richter, L., *Das Gesetz über die Beschäftigung Schwerbeschädigter*, Bücherei des Arbeitsrechts, n.s., vol. vii (Berlin 1927).

REICHENSBERGER, AUGUST (1808-95) and PETER FRANZ (1810-92), German Catholic political leaders. August Reichensperger was born in Coblenz, served as provincial judge in Cologne and Treves and in 1849 was appointed appellate judge in Cologne. As a member of the Frankfurt National Assembly in 1848 he attacked the revolution on the ground that its recognition would result in a permanent state of revolution. He defended the fundamental law of personal freedom but was opposed to unlimited freedom of occupation and uncompensated peasant emancipation and agrarian reform. As a Catholic he advocated freedom for the church and the clerical order. For several years he was a member of the Prussian assembly and leader of the Catholic deputies. He played an outstanding role in the establishment of the Catholic Center party, which he and his brother Peter along with Mallinkrodt led during its early years. In the Reichstag he fought against the growing military appropriations and in 1879 advocated universal disarmament. Originally he opposed the anti-socialist law of 1878 but defended it later because of the radicalism of the Social Democrats. He advocated the independence of federal from state finances as a means of safeguarding the Reich's federal constitution. He played a major role in German social reform legislation, always emphasizing the necessity of a Christian basis for the political order and for personal liberty. Although he was a supporter of monarchical government, he believed it should be founded on democratic institutions.

Peter Reichensperger was born in Coblenz. In 1850 he became appellate judge in that city; from 1859 to 1879 he was counselor to the higher tribunal in Berlin. For four decades he served as

a member of the Prussian state assembly and for twenty-one years as a member of the Reichstag. Like his brother he was an opponent of economic and political liberalism but an advocate of personal freedom based upon a Christian moral order.

The Reichensperger brothers stemmed from the upper liberal Catholic bourgeoisie of western Germany, which was influenced by the temporary French annexation of the Rhineland and by close contact with the west. Despite this liberal aspect, however, the Reichenspergers preserved the conservatism characteristic of hidebound Rhenish Catholicism, which determined their political philosophy as well as their economic and social ideas.

REID, WHITE-LAW (1837-1912), American newspaper proprietor and diplomat. Reid acquired his early newspaper experience chiefly on the Cincinnati *Gazette*, for which he was correspondent on the Civil War battlefields and in Washington. In 1868 Horace Greeley persuaded him to join the staff of the New York *Tribune* and in 1869 made him virtually managing editor. After Greeley's death in 1872 Reid acquired a controlling interest in the paper and for the next thirty-three years, except for short intervals, was actively engaged in its management. Under his ownership the *Tribune* became institutionalized; it was converted from the personal organ of an editor into a great newspaper property, and as such its ties with the prevailing order of things became closer and closer.

Following Greeley's candidacy for the presidency in 1872, for which Reid was largely responsible, the *Tribune* for several years steered an independent course, but by 1876 it was back in the Republican ranks and thereafter was generally regarded as a party organ. Nevertheless, Reid preserved a considerable degree of independence. While he could close his eyes to the weaknesses of Blaine, he consistently fought

the state bosses Conkling and Platt and freely criticized Republican administrations when he considered them blameworthy. On economic questions, however, the *Tribune* never deviated from the paths of regularity: it was a staunch defender of protection and sound money; it fought efforts at government regulation of industry and also labor's right to unionize; and the violence of its attacks on Bryan in 1896 (he was likened to Benedict Arnold, Aaron Burr and Jefferson Davis) had much to do with making that presidential campaign a bitter class contest.

In the 1890's Reid, in company with Captain A. T. Mahan, Albert Shaw, Theodore Roosevelt and Henry Cabot Lodge, became an ardent oversea expansionist, although he was by no means a jingo. A member of the peace commission following the war with Spain in 1898, he was the leading advocate of American retention of the entire Philippine archipelago. In writings and addresses thereafter he defended the constitutionality of expansion but opposed all plans for making states out of the new possessions. He supported warmly Roosevelt's policy in Panama and the Caribbean, predicting an American protectorate over all that area. Reid was minister to France during 1889-92 and ambassador to Great Britain during 1905-12. His career in the two capitals was marked by success in cultivating cordial relations rather than by any outstanding concrete achievements. In London particularly his Anglophilism and his personal charm promoted the growth of a friendly understanding between Great Britain and the United States.

REIMARUS, HERMANN SAMUEL (1694-1768), German historian and philosopher. Reimarus, professor of ancient languages and philosophy in his native city of Hamburg, lives in history primarily as the author of the *Fragmente*, which Lessing, against the author's wish, published as a supposed find in the Wolfenbüttel library.

Under the influence of Voltaire, Bolingbroke, Collins, Toland and Mandeville, Reimarus in the *Fragmente* attacked passionately all revealed religion. He related in his own language the *chronique scandaleuse* of the Old Testament. He transformed the history of religions into a history of clerical deceit, greed and ambition. His

conception of Jesus as "armed prophet" was of the highest importance for the development of political thought: as Reimarus presents the story, Jesus desired to establish secular rule under the cover of religious phrases, at the head of a devoted following somewhat in the manner of Savonarola, the Münster Anabaptists or the English Fifth Monarchy Men. Only after an abortive rebellion did the apostles perpetrate a sort of "spiritual coup d'état" by dressing up the messianic myth in imaginative form. It was through their "communistic" welfare organization that the apostles won a political following. The modern view of primitive Christianity as a communist rebellion has its source in Reimarus, as have also modern judgments of the chiliastic prophets as leaders of a band of "saints" in a fight for power, booty and wealth. Notwithstanding the extreme nature of his conclusions and despite all his one-sidedness and shallowness, Reimarus' work exercised a stimulating influence on the study of the life of Jesus, on the recognition of the eschatological element in primitive Christianity and on the historiography of chiliastic social movements.

Reimarus was a confirmed opponent of the materialism of the French *encyclopédistes*. His *Wahrheiten der natürlichen Religion*, an almost classic German expression of deism, played a role in the history of German idealism. He incorporated the idealistic German trend of the philosophy of the Enlightenment as well as the later socio-philosophical optimism and eudæmonism. God, according to Reimarus, created an entirely reasonable world which has no need of miracles, revelation or redemption. The basic religious truths are contained in the "eternal evangel" of reason and are not tied up with any particular historical revelation in any particular corner of the earth's surface. Man is destined for happiness. Everything in the world has its purpose and is arranged for the use of living creatures. God's providence is revealed even in the folds of the rhinoceros' skin. Evil in the world is but an appearance and, as in later classical economics, becomes the cause of good through an "unseen hand." "It constantly points the course to the good."

Reimarus was also of great importance as a pioneer in animal psychology and animal sociology. He originated the concept of instinct. Praised as the founder of modern animal psychology, he stood in reality with Aristotle and the scholastics. He opposed ascribing intelligence to animals and thereby humanizing them.

Consequently, he attacked Rousseau's "human animals," as he called them, living without morality or society in a state of nature. He likewise attacked the pessimistic conceptions of human nature and society held by Mandeville and Machiavelli. "Reason, freedom and perfectibility" were for him the criteria of human-kind and of human society.

MICHAEL FREUND

Works: *Wolfenbüttel Fragmente*, ed. by G. E. Lessing (Brunswick 1774-78), later ed. as *Fragmente des wolfenbüttel'schen Ungenannten* (Berlin 1784), tr. by C. Voysey (London 1879). The *Fragmente* can also be found in Lessing's collected works, vols. xi-xii of the Lachmann ed. (3rd ed. Berlin 1886-1924). The *Fragmente* is part of a larger work, "Apologie oder Schutzschrift für die vernünftigen Verehrer Gottes," not completely published; parts of it appeared as *Ubrige noch ungedruckte Werke des wolfenbüttel'schen Fragmentisten*, ed. by C. A. E. Schmidt (n. p. 1787), and in *Zeitschrift für die historische Theologie*, vol. xx (1850) 519-637, vol. xxi (1851) 513-78, and vol. xxii (1852) 380-494. *Die vornehmsten Wahrheiten der natürlichen Religion* (Hamburg 1754; 6th ed. by J. REINACH, SALOMON (1858-1932), French archaeologist. Reinach came of a prominent Jewish family which had moved from Germany to France early in the nineteenth century. He did active archaeological work in the Greek islands, Asia Minor and Tunis but his great contributions were made through his writings, which cover philology, archaeology, art, philosophy, anthropology, history and religion. In nearly a hundred books and more than five thousand articles Reinach reported and inter-

preted the findings of field workers and made available to other scholars vast stores of museum material. He was one of the first to apply anthropological theories in the explanation of archaeological data. Influenced by Frazer and Robertson Smith, he read signs of totemism and tabu into all the cultures of classical antiquity. After 1900 he turned to the scientific study of religions not only because of an interest in religious origins and history but because he felt that scientific understanding opened the way to popular emancipation from the thralldom of religion, which he defined as "a sum of scruples which interfere with the free exercise of our faculties." In reconstructing the origins of religion he drew materials from prehistory, preliterate cultures, survivals in modern cultures and the psychology of the higher animals, children and contemporary primitives. He concluded that the earliest elements in the religious complex were tabu and animism, the one resulting in social codes, the other peopling the environment with spirits in varying ramifications of fetishism, polytheism, ancestor cults and monotheism. The animistic element also led men to include animal and plant species in their own group, while tabu protected the members of these species. Totemism thus established was an important phase of early cultures leading to the domestication of animals and to agriculture. The host of spirits was controlled by magic, "the strategy of animism," which was the mother of the true sciences. The priesthood then organized the unwieldy and non-rational mass of tabus and so took the first step toward the emancipation of man from religious scruples which rationalism will some day complete.

A better understanding of the materials formerly classified under totemism has negated many of Reinach's interpretations. During the last two decades both anthropology and the science of religion have abandoned schematic theories of religious origins as well as the idea of a unilinear law of religious evolution, and they now tend to supplement the psychological approach with the findings of all auxiliary sciences. Reinach's reconstruction of religious origins, like that of all the pioneers, is outmoded but still retains the charm of a work of art.

For thirty years Reinach was joint editor of the *Revue archéologique*. As editor, professor at the École du Louvre and director of museums his life was devoted to scholarship. He took no active part in politics. The Dreyfus affair moved him to translate Lea's *History of the Inquisition*

(3 vols., Paris 1900-01). During the World War he interpreted American opinion in a four-volume work, and in his *Paix précaire ou paix durable* (Angers 1916; first published in English in *Nation*, vol. cii, 1916) he suggested a plan for permanent peace through disarmament and an international police.

A. EUSTACE HAYDON

(Paris 1915-19); *Histoire de la Révolution russe* (1905-1917) (Paris 1917); *Amalthée; mélanges d'archéologie et d'histoire*, 3 vols. (Paris 1930-31).

Consult: Pottier, Edmond, in *Revue archéologique*, 5th ser., vol. xxxvi (1932) 137-54; Ricci, Seymour de, in *Revue des études juives*, vol. xciv (1933) 2-28, with bibliography.

REINACH, THÉODORE (1860-1928), French historian. Théodore Reinach was the youngest of the famous three Reinach brothers. His scientific interests were concentrated mainly upon the civilizations of ancient Greece and the Hebrews. He was active in Jewish communal affairs and was editor of the *Revue des études juives*. He contributed many short studies and articles on various aspects of Jewish history and culture and wrote a popular survey of Jewish history, *Histoire des Israélites* (Paris 1884, 5th ed. 1914), which was translated into several languages. His most important work in this field, however, was concerned with the history of the Jews in classical antiquity. His *Textes d'auteurs grecs et romains relatifs au judaïsme* (Paris 1895) is an important source for the study of the Jews in this period and his translation of and commentary upon the works of Flavius Josephus (vols. i-x, Paris 1900-20), which remained uncompleted at his death, are the standard authority for the life and works of this author.

Reinach's work was even more significant in the field of Greek history. He studied with ex-

traordinary competence all phases of Greek civilization; numismatics, epigraphy, papyrology, philology, musicography, archaeology, science, law and history. He threw new light on the dynasties of Asia Minor by his studies on their coins. His *L'histoire par les monnaies* (Paris 1902) as well as his courses at the Sorbonne and at the Collège de France contributed greatly to stimulate the study of numismatics. Reinach also devoted himself to ancient music. He reconstituted the musical notations of the hymns preserved in the Delphic inscriptions and papyri, collaborated with Henri Weil on a study of a hitherto obscure treatise of Plutarch on music and published a more general study, *La musique grecque* (Paris 1926). In the field of archaeology his studies of the sarcophagi of the royal necropolis at Sidon demonstrated the fact that Hellenism had penetrated into Phoenicia before the Macedonian conquest. Reinach collaborated in the publication of the *Recueil des inscriptions juridiques grecques* and was editor of the *Revue des études grecques* and the *Gazette des beaux arts*.

GUSTAVE GLOTZ

Consult: Glotz, Gustave, in Académie des Inscriptions et Belles Lettres, *Comptes rendus des séances* (1928) 321-26; Ricci, S. de, "Écrits de Th. Reinach relatives au judaïsme" in *Revue des études juives*, vol. lxxxvi (1928) 113-30.

RELIGION. Most definitions of religion are advanced from the point of view of some particular religious creed, usually the Christian, and as a result fail to isolate the more universal essence of religion proper. In the search for a generally valid definition the etymology of the term itself is illuminating. The two most generally accepted derivations are those given by Cicero and by the "Christian Cicero," Lactantius, a teacher of Latin rhetoric in the first half of the fourth century. While the former derived the term from the verb *religere*, i.e. to execute painstakingly by means of repeated effort, the latter derived it from *religare*, to bind together, and interpreted religion as essentially a "bond of piety." These two interpretations suggest the twofold aspect of religion. On the objective side religion involves the recurring performance of certain human activities and thus belongs to the realm of external phenomena; on the subjective side it is part of the hidden experience of the psychic life. Although such a dichotomy is to a certain extent unrealistic, since the external manifestations of religion are organically rooted in the inner experience, an inquiry, such as the

present, undertaken primarily from the sociological point of view must presuppose a strictly objective phase of religion and throw its major emphasis there.

The problem of defining precisely the scope of religion is complicated by the fact that the more primitive the culture under consideration, the more pronounced the tendency of the religious sphere to absorb objects and activities which according to modern ways of thinking have no relation to religion. But however shifting the border between the religious and the non-religious, the consciousness of such a border usually exists: thus even in the Polynesian and Melanesian cultures, a distinction is made between *noa*, the ordinary or the profane, and *tabu*, the unusual and the mysterious. The border is sufficiently clear cut for man to become aware of the impact of an "otherness," of the presence of some power or powers which are superior to him, intrench upon his life and must be compounded with if he is to ward off the dangers emanating from them and receive the assistance they can bestow. Thus it is possible to arrive at a preliminary definition of religion as the complex of man's interrelations with the superhuman powers. Such a definition implies the fundamental truth that religion, as defined by C. A. Bernoulli in *Theologie und Wissenschaft* (Basel 1933), is "not an autonomous activity of man or a unilateral manifestation of the human spirit, but involves a process of vital and reciprocal interplay" between the human and the supernatural.

In analyzing more precisely the concept "superhuman powers" a dichotomy must be established between the purely impersonal-dynamistic type and the personal. This fundamental distinction, although not invariably clear cut, is well illustrated by the contrast between the Madagascan cult and Jacob's dream, both of which are concerned with the supernatural power of a particular rock. In the former the rock, which, according to tradition, must be ascended by the chieftain before he is popularly recognized as the incumbent of power, is thought to be itself imbued with force and capable of communicating this force by an impersonal automatic process to any individual coming into contact with it. In Jacob's dream, on the other hand, the rock harbors a divinity and owes its sacredness to the fact that it is a dwelling place of God (Beth-el), containing within itself a superhuman essence which is conceived as a person, subject to the variations and moods of a

spiritual being and accessible to human influence. Quite as clearly as the rock of Madagascar represents a purely dynamistic conception, Jacob's dream typifies a personal or what might be called animistic-demonistic construct. The notion of the holiness of water is likewise capable of two distinct explanations. Sometimes water is invested with direct supernatural power: thus the Zoroastrians, who were completely dependent upon water for their agricultural pursuits, believed it to be replete with the mysterious fructifying substance, *hvarnah*. "O water, bestow thy glory upon him who sacrifices to thee," is the Zoroastrian's prayer in the *Avesta*. At other times, however, the sacredness of water is attributed to the presence of a particular deity. According to the report of the missionary Spieth, when a farmer among the Ewe tribe of southern Togoland found crimson water suddenly and mysteriously spouting out at him from a hole which he had made in the earth, he believed that a *trō*, the native term for demon, had been revealed to him, and accordingly there grew up a cult concerning the presence of a spirit in the water.

In general it may be said that the dynamistic idea tends to accompany magic, whereas the idea of a personal God, or some derivative form of that idea, is associated with religion in its purer sense. But the exclusion of magic from the general field of religion can hardly be justified, inasmuch as magic is more or less clearly the corner stone of every historical religion. Early Brahmanism, and Buddhism in its original atheistic form, are typical examples of religions which at their inception conceived the supernatural power merely as abstract force and only in the later stages of their development became concerned with the idea of a personal God. The attributes and deeds ascribed to gods and sometimes incorporated into the cult, as illustrated by certain purification rites in the cult of Apollo, are often pure magic. In general, however, a distinction within the larger category of religion between magic and pure religion holds valid. The essential difference consists in the fact that the former, in keeping with its purely dynamistic character, involves an essentially automatic process, while the latter must reckon with the good or evil will of the divinity as an autonomous factor. The contrast emphasized by some sociologists between magic as an antisocial and egocentric force and religion as a social, collectivistic force usually takes into consideration only black magic to the exclusion of white. And

yet it is undeniable that black magic, in so far as it shrinks from the light of day, deviates from genuine religion, which has a public organization and practises cults recognized by all.

The problem thus raised as to whether religion in general centers about the individual or the collectivity is an extremely complex one, and it must be emphasized once again that the sociological approach may often fail to do justice to the inner experience of the individual. Attempts have been made to derive the origin of religion from clan or tribal consciousness; in accordance with this view the Semitic God, for instance, has been interpreted as merely the personification of tribal unity. But if as defined above religion is something more than a unilateral construct of the human spirit, its origins cannot be deduced exclusively from group experiences. The experiences from which religion springs are, as Hauer has rightly emphasized, essentially ecstatic in character and the subjects of such experiences are in the great majority of cases single individuals. And unless it is recognized that men are unequal as regards their capacity for the religious experience, it is impossible to understand the actual history of the origin and evolution of religion. Superior capacity inheres not only in the priesthood (*q.v.*), an institution which derives from the abnormal endowments of certain individuals, but also in founders of religion and in all religious reformers. In this respect religion may be compared with art, a field in which a differentiation between the layman and the artist is taken for granted. Similarly in religion certain men have the charismatic ability to see and hear with their inner eyes and ears what the ordinary man does not see and hear until it is revealed to him.

Yet despite the fact that this cleavage between individual and community is already apparent even in the lower stages of culture, primitive religion is predominantly collectivistic. The more primitive the culture, the greater the solidarity of the individual with the social group. Whereas in the modern period man is regarded as an individual who, although bound to his kinsmen, constitutes the basic unit of existence, human personality in the primitive world is completely identified with the group. In such a world the content of religion tends to be identical with the *sensus communis*. The importance of ancestor worship for cultural development consists in its being the most primitive and energetic attempt to preserve, with the aid of rigid ritual, the spiritual and intellectual treas-

ures of a family or group as they have been assembled through decades, centuries or millennia. As the cult of the family or sib evolves into a cult of the tribe or primitive state, the religious fate of the individual remains closely interwoven with that of the collectivity. An example of this is furnished by the ancient Hebrew notion that the sins of the fathers are visited upon the children, even to the third and fourth generation (*Exodus* xx: 5). A similar proverb, "The fathers have eaten a sour grape, and the children's teeth are set on edge," is handed down in *Jeremiah* xxxi: 29 and in *Ezekiel* xviii: 2, although both prophets took personal issue with its implications.

While the conception of religion as a purely private affair is on the whole foreign to primitive and ancient cultures, there is usually present a recurring clash between individual and institutional elements. This is best typified by the deep seated antagonism between the prophet and the priest, although even the Hebrew prophets, who epitomize in its extreme form the personal union between man and god, never freed themselves from the collectivistic attitudes inherent in all religion. The unequal struggle of individualistic against collectivistic forces is clearly manifested in the religion of Greece, where the relations between the political and the religious were particularly close. What the state demanded of the individual was strict fulfilment of the requirements of the public cult. On the other hand, with the spread of the Orphic mysteries, religion had come to revolve around the sin and atonement of the individual. The outcome of the tension which inevitably developed, consciously or unconsciously, between the individualistic-universalistic elements and the purely civic and local aspects was determined to a large extent by broader historical factors. The era of peace and consolidation following the Persian wars, by strengthening the power of the state, bolstered the official cult at the expense of individual communion. It was only in the late Hellenistic period, as a result of the dwindling of state power, that the latter gained the ascendancy. That religious individualism usually appears at a time when the power of the collectivity has been shattered is a fact borne out by present day events; for example, in China.

Even in the most highly personalized religion there is present, however veiled, such a powerful drive toward institutionalization that this tendency may be regarded as an essential characteristic of religion itself, a tendency which for

its complete realization, however, presupposes a fairly stable social system. Although some religions lay down a way of life, which, like the Hindu *jñāna-mārga*, can be pursued only by the individual, the forces making even here for organized association are well illustrated by the typical case of Buddhism. The congregation of the faithful, which arose in the earliest stages of Buddhism, was included, alongside the person of Buddha and the teaching, as the last of the "Three Gems" in the declaration of faith of the catechist; while as a result of the Mahāyāna reform the *jñāna-mārga* element itself tended to give way to *bhakti-mārga*, the original element of which was the communal worship of God.

A similar evolution may be traced in the history of Christianity. Although Jesus has been regarded as the outstanding exponent of individualistic religion, the conception of the church as the body of Christ is present even among the early apostles. The pronouncement of Cyprian that no one could claim God as a father who did not accept the church as a mother, adequately epitomizes the subsequent attitude of Catholicism, according to which the adherence of the individual to the Christian religion is dependent upon his baptism into the one holy Catholic and apostolic community (see RELIGIOUS INSTITUTIONS, CHRISTIAN, section on ROMAN CATHOLIC). The Reformation, it is true, through its doctrine of justification by faith established an immediate relationship between the individual and his Creator; but official Protestantism, definitely repudiating the individualistic principle of the Anabaptists, served, in spite of its numerous modifications of traditional doctrines regarding the church and the sacraments, to perpetuate the older faith in a community of saints, whether in the form of the church visible, the church invisible or merely the predestined band of the elect. The emphasis placed by Pietism on the more restricted religious sodalities within the church is often encountered among Christian sects and free churches. Despite its origin as a schismatic movement against a larger *ecclesia* the sect usually continues to adopt rites which express the idea of unity and to stress the deliberate act of association into a narrower unit performed with a view to displacing the older superpersonal "organization" by the "fellowship" of kindred-minded souls.

In the history of monasticism the collectivistic tendencies of religion are shown even more strikingly. To be sure this phenomenon,

growing out of the need impelling the religious zealot to seek isolation as a means of freeing himself from worldly entanglements, may culminate in the extreme individualism of the anchorite. But in the form of monasticism, which is infinitely more significant from the historical point of view, the underlying principle of *monos* is conceived and applied as a collective rather than as an individual unity. Even in mysticism, which represents perhaps the most highly personalized variety of religious experience, the individual personality soon tends to become engulfed in the all inclusive godhead. The political and economic individualism of the modern period has of course been reflected in a corresponding resurgence of individualism in the sphere of religion; but even here it is true that the extent to which religion has been a vital force in the community has been determined by the degree of its effectiveness in establishing a solidarity between the religious individual and the religious collectivity.

In analyzing the individualistic elements in religion it should repeatedly be borne in mind that the work of the charismatic religious leader is heavily conditioned by the milieu in which he operates. It is conditioned in two ways: first, the milieu determines his own spiritual equipment; and, again, the milieu determines the manner in which his message is received and perpetuated. Since no religious innovator can defy the ethos of his native culture, his reforms must to a certain extent keep within the limits of a certain traditional continuity. For the masses of the people are capable of assimilating at best only those elements of his gospel which represent a grafting of the new on to the old. This conditioning influence of the milieu is no less important in the conceptual realm than in the sphere of ritualistic practise. Just as the magician of the hunting tribe in introducing an innovation in magic technique must of necessity make use of the technological resources at the disposal of his people, so the general conceptions of magic from which he proceeds are part and parcel of the common fund of beliefs. In the Mosaic code there are a number of commandments, such as that regarding the Sabbath, which by reason of their patent incongruity with the nomadic culture in which Moses lived can be understood only as the expression of that later, and much more stabilized, Hebraic culture when the oral tradition was converted into scripture.

The religion of Zoroaster is particularly illuminating as a reflection of the culture from

which it spring. It could have grown up only at a time when the neighboring tribes were conscious of undergoing a transition from the nomadic to the settled stage. Agricultural and pastoral pursuits therefore became identified with religious duty, as is apparent in such sacred aphorisms as "He who sows corn, sows holiness," and "When corn is ground, the *Daēvas* [devils] groan." The injunction of the holy *Avesta* to "lay an abundance of fodder before the cow" is a familiar way of recommending the fulfilment of obligations in general; similarly the acquisition of a cow symbolized the attainment of heavenly bliss, while to the slaughter of the primeval ox Iranian cosmology attributes the creation of the entire plant and animal world. The dog as guardian of the herd is venerated as a virtually sacred animal, and for his mistreatment the religious law prescribes extremely severe penalties. But the influence of the milieu goes even deeper. The rigid dualism in the Zoroastrian religion between light and darkness was a direct reflection of the struggles of the inhabitants against a bleak climate and the vicissitudes of wringing a meager existence from the barren steppes and mountain lands.

This raises the question of the extent to which topographic and climatic factors in general may be said to condition the forms of religion. From this point of view the break up of the original Aryan religion into a Persian branch and an Indian branch is particularly illuminating. For while the Hindus at one time undoubtedly shared in that characteristically Aryan zest for deeds and human activity which is reflected in Persian Zoroastrianism, they lost these qualities as a result of their migration to the tropically luxuriant lands along the Ganges and in an enervating atmosphere of ease and abundance gradually surrendered themselves to a type of quietistic speculation and brooding which came to color their entire religious outlook.

In fact the determining influence of natural environment may be repeatedly detected not only in the general religious temper of a people but in the details of their theology, mythology and eschatology. Thus the preeminence of the moon god in most of the Semitic religions is to be ascribed to the nomad's preference for the coolness of the night when he may wander in comfort and ease, free from the blazing sun. The Babylonian designation of the king of the gods as "Great Mountain" and the characterization of his temple as "Mountain House"—to say nothing of the entire architecture of the

temple towers with their spiraled approaches—suggest that the Sumerians, the progenitors of this entire culture, sought in the plains of Babylon to honor their gods in the same manner as in the mountainous homeland from which they had migrated. Maritime peoples, on the other hand, invest their deities with the attributes of the sea and of seafaring activities and consider the future state of bliss as an endless expanse of water abounding in fish. On the other hand, a great catastrophe on the sea may give rise to the notion of a universal flood, which is projected either backward into the remote past or forward to the end of the world, while the dread rigors of an arctic climate may give rise to the expectation of a *fimbul* winter to come at the end of time.

Natural human sympathies and antipathies are likewise transposed into the religious sphere, the foes and friends of the group becoming the foes and friends of the gods. The problem thus raised as to the influence exerted by human society upon the development of religion may be followed step by step, inasmuch as each transformation of the culture produces a corresponding modification of the religion. Even the effective use of a new tool requires the introduction of appropriate ritual ceremonies in order that spiritual mastery over the object may be established. Every step in cultural progress extends the sphere of the existing gods or creates new ones. For it widens the range of human needs, and human needs in turn call into being gods who can satisfy them. With the spread of artisanry and trade new types of gods appear; and where trade reaches into foreign lands, alien deities are often assimilated into the native pantheon, as the Phrygian divinity, for example, was taken over into Attica.

Similarly the natural evolution toward social differentiation produces a corresponding differentiation in the supernatural world. How the increasing rigidification of class structure is reflected in the characteristics of the gods is well illustrated by the Edda, *Hárbarðsljóð*, which depicts the antagonism between the crude peasant god, Thor, and the more refined god of the nobility, Odin. In taunting Thor, Odin's trump card is the jibe, "Odin is master of the nobles who fall on the field of battle. Thor is master only of slaves." Likewise the differentiation in occupation has its counterpart in the religious sphere. In India the god Agni tended to take on more and more the characteristics of the priestly caste, as Indra did of the warrior caste

and the close connection between Mithras and the mercenary soldier has often been noted. In the Orient as well as in the Occident—as Max Weber has pointed out in connection with the Kabīr-Panthis sect of India, which was founded by the weaver Kabīr and recruited its following among the weavers—the textile crafts, being limited to the home, were conducive to private meditation and therefore seem to have generated a type of worship practically free from ritualistic elements. The process whereby the form of religion is modified as a result of the breaking up of the monopoly exercised by narrow professional groups is clearly revealed in the *Upanishads*, which echo the sentiments of hitherto excluded and inarticulate types—king, as well as women and persons without established lineage.

With the progress of urban culture those religious festivals which were built around agriculture tended to dwindle in importance or to accrete new symbolisms. At the same time, as a result of growing precision in the calendar, festivals came to be held at definitely fixed intervals. Supremely important in the development of religion were the discovery and dissemination of writing. This is reflected not only in the express delegation of the guardianship of writing to such gods as the Egyptian Thoth, the Babylonian Nebo and Bēlit-sēri, the Japanese Tenjin-Sama, the Celtic Ogmā and the Norse Odin but also in the momentous consequences attendant upon the transformation of Judaism from a prophetic religion to one based on codified scriptural law. It was merely the ultimate conclusion of such logic, in which both Christianity and Islamism followed Judaism, when the Hebrew rabbis portrayed God Himself as poring night and day over the Torah.

The development of religion is also permanently influenced by political and civic forces. It is always instructive to study the terminology and linguistic symbolism of a religion, in view of the tremendous power exercised by conceptual associations over the inner religious sense of the individual. The attributes and the names bestowed upon the gods automatically change in accordance with the form of the state. The god as king is merely a transposition of the human as king, the divine kingdom merely a transposition of the earthly kingdom. The characteristically Aryan conception of the *asuras* as divine might is an expression of the ancient Aryan political system. Moreover, since the prince or king is supreme judge, the deity is

likewise clothed with the judicial function and vested with the final decision as to human guilt or innocence. The belief arises therefore that the gods are the natural avengers of human transgression. Juristic conceptions of this type, which emphasize the deity as punisher and judge, occupy a central place in the religious outlook not only of Judaism but also of Christianity and Islam. An interesting correlation might likewise be made between the prevalence of male gods and the patriarchal form of social organization on the one hand and between the female god, which is common in the religions of Asia Minor, and the matriarchal society on the other.

The even more pronounced tendency for changes in the political fortunes of a city, a province or a section to find a reflection in a corresponding rise or decline of the patron deities may be observed not only in the Egyptian and Babylonian pantheons but also among the Athenians. Thus the myth of Triptolemus—a name meaning literally “the plowman who plows three times a year”—was evolved by the Athenians as an expression of their own dominant position in Greece.

Religious development may be conditioned also by the broader impact of neighboring cultures. The classic example of the working of such influences from abroad is the gradual orientalizing of the religions of antiquity as a phase of the general process whereby the cultures themselves were transformed under the impact of oriental infiltrations. Similarly in the history of the expansion of Christianity it is significant that whereas the English and most of the continental tribes, having been rapidly drawn into the Romanic culture, adopted the Roman form of Christianity with little modification, the Scandinavian tribes, which by comparison had clung jealously to Nordic ideals and Nordic ways of life, carried over into the new religion most of the crucial religious forms of the old.

In all cases the process of transplanting a religion to an alien environment brings into sharp relief the dependence of religion on culture. The change in the character of Hebrew religion which resulted from the migration of the nomadic Israelites from the desert to the arable lands of Palestine may be paralleled by that which took place in the case of Babylonian religious attitudes and practises as a result of contact with the culture of the Sumerians. This process of transformation is all the more manifest in the spread of the world religions. It may

even go to almost grotesque lengths, as when the Buddhist monks in the intensely militaristic atmosphere of tenth and eleventh century Japan so far lost sight of the essentially pacifistic nature of their own religion as to allow themselves to be exploited as an agency of war, whether defensive or offensive. Naturally enough the strong influences of the local cultures encountered by an expanding religion are to no small extent religious in themselves. For example, the development of an Islamic mystic sect in Persia could not be explained without reference to certain religious currents already existing in Persia. The way in which local cults preserve a certain identity of their own, even after their assimilation into a higher religion, and thereby change the character of the latter is most clearly revealed in the incorporation of local saints, with their attendant cults, into the professedly monotheistic ritual of Christianity, Islam and Buddhism. For the local saint is very often nothing more than an older local deity purified of his "heathen" attributes through "baptism." This perpetuation of the indigenous numina is an expression not only of the conservatism inherent in the religious process itself but of a widespread popular yearning to establish immediate contacts with some deity less remote than the supreme God of Christianity or Islam and less impersonal than the almost atheistic spirit originally proclaimed by Buddha.

The progress of culture in general is accompanied by a gradual refinement and spiritualization of religious and ethical concepts as well as of ceremony. The demonistic powers, whose actions are as a rule unpredictable, are either gradually replaced by friendly deities or the evil spirits are reduced to a position of malicious, but in the last analysis impotent, antagonists. As the primitive codes based on blood vengeance give way to a more orderly and peaceful legal system, the older notions of divine vengeance are displaced by a conception of divine law which throws its emphasis on the moral distinction between right and wrong.

It is true of course that in numerous regions which are more or less isolated as a result of topographical barriers or other natural factors the general backwardness of the culture is reflected in the persistence of primitive religious attitudes and practises. And only too often there may be encountered what is apparently a cleavage between culture and religion. The Prometheus myth is clear enough evidence that under certain circumstances the gods may be set upon

by heroic champions of humanity, who seek to wrest from them cultural elements denied to man. Instances may be multiplied to show that religion has repeatedly set itself across the path of cultural progress. In fact religion by its very nature develops in time a cult which zealously perpetuates older usages long since obsolete in daily life and in the performance of its religious rites, such as sacrifice and circumcision, still frequently makes use of instruments deriving from a past era of culture. The pronouncement from the powers that be in the Islamic church that under no conditions may a phonograph be used in summoning the faithful to daily worship is not to be dismissed as merely an instance of reactionary conservatism. For noted Christian ritualists have likewise opposed recourse to certain mechanical devices of the modern era on the historically plausible ground that these devices operate against the attentiveness and devotion essential in all ritualistic ceremony.

But by and large it is readily apparent, on the basis of the preceding analysis, that religion, in its more formative stages, is heavily conditioned by the society and culture from which it springs. It remains to be shown that religion is an equally powerful force in molding that society and culture. The further back one goes into the history of human culture, the greater the degree to which the life of human society, even in its purely external aspects, seems incased in the magico-religious. On every hand the primitive man comes into contact with objects which he believes to be laden with mana; so perilous do such contacts seem to him, that in trying to avoid them he forges an entire chain of tabus and with this chain imprisons himself. This conception of mana is so universally shared by the entire primitive community that no one would think of trying to escape from its sway. At this primitive stage therefore religious belief is a powerful sanction in the enforcement of a standardized community discipline, particularly from a negative point of view. Thus places which have been visited by a mana man are forbidden to other members of the tribe; just as food which he has left unfinished must not be eaten, since mana, like its counterpart tabu, is thought to have a contagious force, comparable in its dangers to a high tension electric wire. On the other hand, the individuals who are tabu are subjected to strict regulations. Lest harm befall the group, women in childbirth and at the time of their menstrual periods, young people passing through puberty as well as the victims of certain

diseases are isolated from society. An especially stringent tabu is associated with the corpse, contact with which is supposed to cause infection from the mysterious poison which it exudes.

By these and similar customs the primitive group regulates not only biological processes, particularly in the critical stages of physical change, but also diet, choice of clothing, economic activity, use and distribution of property and relations between the sexes. In some extreme cases certain types of persons are forbidden to meet; for instance, on the island of Santa Cruz a man and the wife of his mother's brother are not allowed to see each other, and in case they should accidentally violate the tabu the man must break some of his arrows and the woman smash one or two of her water bottles. The extreme lengths to which the systematic elaboration of tabus may lead are typified in the remarkable regulations of the Australian totem tribes for enforcing their rules of exogamy. Alongside such restrictions on the relations between the sexes there are also certain other types of tabu which relate to particular occupational groups; caste exclusiveness is an expression of such a type, despite the fact that caste does not invariably coincide with occupation.

As the tabu idea extends to the categories of space and time, it leads to conventions which may exert a wide influence on human society. The limits to which its magical faith in the utilization of space may occasionally extend are evident in the Chinese fêng-shui, a geomantic system based on a dualistic view of cosmic forces which dominates all of Chinese architecture; as well as in Zoroastrianism, which through fear of polluting the elements enjoins travelers to take a land route, even though it might be longer, so as to avoid going by sea. To a still greater extent human activity is affected by the belief that at particular times it is unpropitious to enter upon certain undertakings. This involves the broad question of "lucky days." The high value still attaching from a social point of view to Sunday as a day of rest reveals how age old usages may be perpetuated over thousands of years, having lost nothing but their original religious meaning.

Similar variations may be noticed in the reasons lying behind tabus on certain foods: the eating of certain meats may be forbidden in one cult merely by way of protest against the veneration in which the animal had been held at an earlier stage of the religion or in which it is still held by another cult—considerations which

in the case of a people engaged in cattle breeding may determine the selection of animals for domestication. Ritual prescriptions with regard to the treatment of animals have had still more far reaching consequences. So strictly did the Jains observe the prohibition (*ahimsa*) against killing animals that they refused to go through water for fear of killing insects, and because a Jainist king refused to let his army march during the rainy season he lost his crown and his life. The *ahimsa* also, by excluding the laity from certain occupations, was responsible for the increasing number of Jains who turned to mercantile and other lines of business activity. The awe with which the Buddhistic formula of confession surrounds all tilling of the soil and, on the other hand, the glorification by Parsism of the industrious pursuit of agriculture offer striking evidence of the influence which religion may exert on social activities. In a similar vein the Old Testament urges, "Be fruitful, and multiply, and replenish the earth, and subdue it" (*Genesis* 1: 28). The Indian Kabîr, in protest against the prevailing ritualism, cried out in the name of religion: "Better than statues are the millstones which grind the corn"; and Luther declared that the "stroke of a thresher in the granary was more acceptable than a psalter sung by a Carthusian."

The social incidence of religion may be said to continue the tendency observable in the most primitive stages of magic, where certain rituals are employed to wrest from nature the blessings necessary for mankind. This is the meaning of the sun, rain and fertility rites. As soon as the powers invoked for this purpose are personified as gods, who control first agriculture and in time all the other spheres of cultural activity, the way is open to the development of a cult which may exercise the most profound influence upon the structure of human society. The bond which unites the adherents of a cult is stronger than any other tie except that of blood. Through the dissemination of a cult the locality in which it has its center may acquire increased political prestige, as in the case of the cult of Astarte, which raised the city of Sidon to a position of such preeminence as a religious capital that Sidonian came to designate all Phoenicians.

The inner workings of ritual and cult may have even more significant ramifications. The more complex its structure the more imperative becomes the need for specialization on the part of its administrators, and in response to this requirement a professional class of clerics is

called into being and consolidates its position. The zeal to please the gods, by stimulating the most patient craftsmanship and endless refinement of technique and by contributing to the aesthetic education of the devotee, has enriched architecture, the plastic arts, music, dance and poetry. The beginnings of science are likewise to be traced to cult ceremonial. From the desire to hold the ceremonial at certain specified times arose precise computations of the calendar, which in their turn presupposed astrological observations. In India the laying out of the sacrificial clearing gave an impetus to geometry; while from the inspection of the slaughtered animals were gained the first ideas about anatomy. The priest was originally a medicine man; from his alchemistic speculations chemistry evolved. Concern for the correct pronunciation and use of words in sacrificial incantations and cult songs made of the early Brahmans the first phoneticians and grammarians. Since the temple was the earliest seat of law, the priests became jurists and their practises left an indelible impress on the science of law. Economic life was stimulated by the fairs which grew up in connection with the sacrificial festivals, while the origin of money is closely linked to the cult of the gods, described by B. Laum (*Heiliges Geld*, Tübingen 1924) as the "creator of standardized media of exchange." The temples were the oldest banks, serving not only as places of deposit but also, as in the case of the early Chinese temple, as lending agencies. Equally important from an economic point of view was the endowment of the temples with landed property. The close relation between religion and economic life is further illustrated by the recurring tendency of economic groups to become associated with a particular cult center, as did a merchants' guild with the temple of Mercury in Rome or the Hindu trading and banker sects (*Vallabhāchārya*, or *Mahārāja*) with one of the Krishna cults. Because of the aversion of the Moslem religion to nudity Islam made contributions of the first importance to the development of the textile industry, at least in so far as it provided a market for textile products; conversely, the Old Testament by banning the worship of idols served to impede the progress of Hebrew art.

As soon as the adherents of an evolving religion attempt to stay the processes of change by formulating a rigid body of dogma, that religion, reenforced by the pervasive power of doctrine, has the capacity to inspire in the faithful a fanatical zeal, which impels them not only to

obey its precepts with meticulous care but to risk their lives in its defense. The staunch faith that "it is the will of God" has dispatched armies across angry seas; the harsh doctrine of predestination and the promise of immortality were decisive factors, if not the basic motive force, in the expansionist policy of the Islamic conquerors, while analogous tenets impelled the Christian Protestants toward an ascetic thriftiness which made them tireless and daring business men. On the other hand, through its emphasis upon the special divine grace visited upon the poor and weak Christianity as well as Judaism has also given a tremendous impetus to social betterment in the name of fraternal love. Very often, as in India and in the territories affected by the Hellenistic mysteries, religion has helped to redress the balance of social inequality: moreover some slight and imperfect solution of the social problem is offered by the doctrine of metempsychosis. Buddhism, by counseling its adherents to "conquer their thirst," undoubtedly has had a civilizing effect upon the peoples under its sway.

One of the most powerful and enduring aspects of the influence of religion upon human society lies in the sphere of ethics. The process is one of interaction rather than of unilateral causation: cultural progress by stimulating the introduction of ethical standards in society contributes to the development of an ethical conception of God, and the more exalted idea of God in turn intensifies the social concern for morality. The codification of religious sayings, in so far as it makes them more binding, operates in the same direction. The more anthropomorphic the conception of God, the more man will be constrained to pattern his life on the model of the deity: the idea of the *imitatio Christi* is only one manifestation of a normal trend. Thus the monotheistic cult of the sun in the Roman Empire was not merely a reflection of oriental imperialism but also a powerful factor in building up the imperialism of Rome itself. Herodotus' famous statement concerning the inculcation of truthfulness into the Persian youth is best explained against the background of a religion which views the conflict between the good and the evil deities essentially as a struggle against deception. Religion was also the main-spring in bringing about that economic well being and prestige which the Persians in the course of their historical development came to achieve.

It should by now be evident that religious

devotion as the ultimate motive power of activity has contributed to the development of human society. The antithetical role wherein religion, as already noted, has blocked the path of progress and has even adopted deliberately retrogressive and antisocial attitudes is to be explained by the fact that socio-cultural progress and religion come gradually to operate on different planes. Although in this sense religion may be viewed as a world unto itself, any attempt to isolate its essential, universally present element tends to be thwarted by the presence of irrational factors which defy reasoned analysis. Moreover it is impossible to construct any convincing typology, since in any one religion there are at least as many variants as there are social layers participating in it. In addition to simultaneous variations it is necessary to reckon with variations which arise from the dynamic unfolding of a religion in time. Religion, however conservative in nature, has a history; and that history, as fluid and protean as human life itself, cannot be reduced to the inflexible categories exacted by the typological method of inquiry. An investigation of this kind can therefore achieve at best only a partial validity.

The overabstraction inherent in all such typological classifications may be exemplified by the distinction which C. P. Tiele draws between the theocratic and the theanthropic religions. In the theanthropic category, in which he brackets those religions which lack the conception of an omnipotent and transcendent God and tend toward a more or less mystical apotheosis of mankind, he includes the Indian religion on the strength of the doctrine of *jñāna-mārga*, or the idea of salvation through the avenue of knowledge. In so doing he entirely overlooks the fact that *jñāna-mārga* constitutes but one of the three ways of salvation offered by the Hindu religion. Similar pitfalls beset every attempt to confine the historical manifestations of religion in a neat system of rubrics, whether the classification be constructed on the basis of the personality or impersonality of the supernatural power; of the variations of the theistic conception; of the natural or ethical, popular or revealed, local or universal character of religion; of the degree of intimacy conceived as existing between man and the forces which he worships; or of the changing forms assumed by the ideal of piety.

While the striking lack of unanimity among modern students of comparative religion regarding the nature of the concept under analysis is a natural consequence of their wide divergence

in intellectual orientation and perspective, their manifold differences may ultimately be reduced to the fundamental conflict between two opposing approaches: the one which assumes God to be an objective essence, and the one which regards religion merely as one aspect of the psychic life of man. At the one extreme stands Hegel's conception of religion as a process working itself out within the being of God; at the other, Feuerbach's conclusion that it is an illusion spun by man. Any intermediate view is at bottom either a modification of one of these extremes or a conscious synthesis of the two.

The difficulties of attaining a comprehensive and balanced view are emphasized by Joachim Wach, who in confessing the weaknesses of religious sociology acknowledged the intangible elements in the nature and purpose of religion, and the inevitable loss or distortion resulting from the translation of the idea into sociological forms as well as from the historical unfolding of religion in society. In the presence of these mysterious forces which have played such a tremendous role in social evolution, the true student of religion, resisting the temptation to dismiss the entire problem with an indulgent smile for the limitations of the human mind, will adopt instead an attitude of becoming humility.

RELIGIOUS EDUCATION. See EDUCATION, section on SECTARIAN EDUCATION.

RELIGIOUS FREEDOM belongs to that rather extensive category of terms which, in the process of gaining popular currency, have lost precise scientific meaning. Usually it is confused with one or another of a number of distinct but not unrelated concepts, such as freedom of thought, although here the difference should be obvious as soon as it is remembered that many of the so-called freethinkers were far from willing to grant full autonomy to the religious conscience. Whereas freedom of thought is a philosophic creed claiming an absolute and exclusive validity, religious liberty is merely a juridical principle concerned with the external relations of individuals and groups. Another common source of confusion is the identification of religious liberty with ecclesiastical or, more generally speaking, theological liberty; in this category may be subsumed a broad range of problems varying from the doctrinal question of free will to the more concrete issues centering about the internal constitution of an ecclesiastical body, as in the struggle of the Gallican church for local autonomy.

It is of first importance that the concept of religious liberty, as here understood, should be differentiated from the attitudes of the different confessions toward their members or toward humanity as a whole. Intolerance is of the essence of every church, an immediate consequence of its faith that it possesses the only effective means for the salvation of the soul. The degree of intolerance depends, it is true, upon the configuration of environmental factors and doctrinal tenets determining the structure of the particular religious institution. A purely national church, while jealous of any force threatening to diminish its prerogatives within the nation, will remain indifferent to the faith of peoples outside. A universal church, on the other hand, with an

equal solicitude for the souls of all races and nationalities, will look upon all creeds as its competitors. A church which conceives human nature to be irremediably sinful and which claims to possess supernatural powers for binding and loosing will display greater intolerance than a church which has higher respect for human nature and human strength. Again, a rigidly monotheistic church will be less receptive than one professing polytheism; a church with a well defined and highly involved creed will be more exclusive than one with a vague and fluctuating creed. But whether manifested in an intense and uncompromising form or accompanied by mitigating restraints, these diverse examples of what might be called ecclesiastical intolerance are not necessarily inconsistent with religious liberty, provided that the individual subjects himself to the religious authority of his own volition and by an exercise of his liberty to choose. Religious liberty is violated by an ecclesiastical institution only when it attempts to enforce its intolerant prescriptions by invoking the sanctions of the civil power, either through the authority which it may itself possess under a theocratic form of government or through an external secular government.

From the point of view of its historical evolution the doctrine of religious liberty is the result of a reaction against such intolerance exercised by the civil power in union with the ecclesiastical. If its antithesis may be defined as a condition where a certain political community protects a religious institution as the dominant or official church and extends sufferance to other religious communities only with grudging restrictions, if at all, religious liberty may be said to inhere in the impartial treatment of all confessions by the state upon the theory that the individual has a right not only to choose for himself but to be safeguarded against potential coercion by any group. According to Ruffini, the purpose of religious liberty is to maintain such a condition in society that every individual will be able to pursue the highest spiritual aims without hindrance. Thus the prerequisites for its emergence include, in addition to the coexistence of a civil power and one or more ecclesiastical powers, a sufficiently developed moral culture so that the individual personality may be conceived as capable of exercising control over his own destiny.

Thus defined the phenomenon of religious liberty manifests three aspects: individual autonomy in the choice of creed, the autonomy of

the religious society in the pursuit of its collective activities and the legal equality of the different confessions before the state. To insure such equality two competing solutions have been developed, jurisdictionalism and separatism. According to the former system, which has prevailed chiefly on the European continent, the state aims to maintain equal status for the confessions within its dominion by exercising vigilant supervision of their activities. Separatism, a system of which America has been the typical example, aspires to attain the same end by relegating all religions to the sphere of private interests, to be invaded only when public safety appears to be involved. Each of them is supported by valid historical and doctrinal arguments and if broadly applied is adequate to sustain religious liberty.

Neither present day jurisdictionalism nor separatism was evolved without a long and arduous historical transition through successive stages of that partial or defective liberty which is generally known as religious toleration. Toleration, which in contrast to liberty connotes that whatever immunity is enjoyed is regarded merely as a revocable concession rather than as a defensible right, implies not only the existence of an established church but the denial of complete equality to certain or all of the dissenting religions. It may be restricted to the mere sufferance of the dissidents as individuals provided that they abstain from worship, public or private; or it may permit worship but inflict civil penalties, such as the English tests, which debarred from public office all who refused to take certain Anglican oaths. It may, on the other hand, be interpreted so liberally as to protect from discrimination all dissenters except those belonging to specified confessions.

No conspicuous examples of religious intolerance are to be found in antiquity. In Greece the absence of a rigid theology and of a distinct priestly caste and the comparative vagueness and instability of the popular religion combined with the prevailing critical and philosophic temper to prevent the rise of religious fanaticism. Rome remained equally aloof from the spirit of intolerance because of the purely ritualistic, institutional and civil character of national religious practises. As has frequently been pointed out, the persecution of Christianity during the first three centuries arose far less from any antipathy on the part of the pagans to the new religion as such than from the unwillingness or inability of the Christians themselves to participate in the

external imperial rites which were considered an essential element in the civil obligations of all citizens. The more adaptable cults with which the Romans came into contact as they extended their domination over the ancient world were accorded a tolerance sufficiently indicated by the fact that many deities of the subject peoples were peacefully admitted into the Roman pantheon. The Jewish religion, by virtue of its strict monotheism and theocratic institutional organization, had a peculiar basis for intolerance but, although its adherents from the earliest times carried on an assiduous offensive against the rival cults of Palestine and Syria, Assyria and Babylonia, it remained a strictly national religion, never pursuing a sustained or official policy of proselytism.

Of the world religions Buddhism, with its nihilistic world view and ethical passivity, has been conspicuously free from intolerance, although on rare occasions in the course of its protean evolution its very adaptability has enabled it to become involved in a program of persecution. Thus in seventeenth century Japan it was decreed that the entire populace should profess some form of Buddhism; but the inspiration of this policy was entirely civil and political, deriving chiefly from fear of the disruptive effects of the activity of Christian missionaries. In Islam religious persecution was a far more important element, as might be expected from the monotheistic and theocratic character of its Hebraic traditions and the militant proselytism of its first adherents. In point of fact, however, Islam was never able to expand beyond the bounds of a national religion. Moreover as early as the lifetime of Mohammed a policy was initiated whereby non-Islamic peoples within the Moslem empire were allowed to retain their own religion at the price of paying tribute. So lucrative was this policy from a financial point of view that not infrequently the conversion of non-Arabians was frowned upon rather than solicited. The precedent established in the earlier centuries was followed by the Ottoman Empire, which in the fourteenth century proclaimed a regime of religious toleration but, while exempting Christians from military service, subjected them to certain legal inequalities and to the payment of an onerous poll tax, calculated to keep them, unless they lived in cities, in economic dependence upon the Moslem landowners. With the conquest of Constantinople in 1453 the Greek church was officially placed under the protection of the Ottoman authorities

and granted not only wide liberties in religious matters but extensive civil control over Christian subjects. In the nineteenth century, however, when the Ottoman Empire began to feel the full force of internal disintegration and external interference from European powers, its previous religious policy rapidly decayed, leaving the way clear for widely publicized persecutions and massacres of its Christian subjects.

The antagonist in the major struggle of mankind for religious freedom has been Christianity, which accentuated the elements of intolerance included in its Hebraic heritage and supplemented them by the introduction of new and potent incentives: the idea of a universal mission, a rigid dogma, the conception of the church as an indispensable mediator between God and man. The process by which these intrinsic bases for intolerance were reinforced by an external legal sanction was begun in the fourth century when, with the adoption of Christianity as the official religion of the Roman Empire, the church entered upon that phase of its evolution which ended in its attainment of a preponderant position in western politics and civilization. So long as the classical Roman Empire lasted, the function of the church remained somewhat restricted, but gradually it succeeded in insinuating itself into the political and administrative affairs of the empire and in educating the ruling classes in its new principles. Eventually it acquired sufficient strength to withhold from pagans and heretics the religious liberty which a few centuries before it had vociferously demanded from its own persecutors. Augustine, a supporter of religious liberty so long as heretics enjoyed a position of hegemony in Africa, bent all of his energies thereafter to the consolidation of orthodoxy. Appealing to the text *compelle intrare* in Luke XIV: 23, he developed the definitive doctrinal foundations for all subsequent persecutions in the name of Christianity. As summarized by Bluntschli, the Augustinian doctrine holds that "when error prevails it is right to invoke liberty of conscience; but when, on the contrary, the truth predominates, it is just to use coercion."

Although it evoked from Augustine's contemporary, Maximus of Madaura, and others, sporadic outbursts of dissent, some of which indicate a highly developed conception of true religious liberty, this doctrine came to dominate the entire policy of the church during the mediaeval period. Beginning with the Verona agreements of 1184 between Frederick Barbarossa

and Pope Lucius III, a series of enactments in all the principal countries of Europe gave the sanction of the secular arm to the Catholic principle that religious unity must be imposed at any cost. Notwithstanding the severity of the methods of persecution devised in their typical mediaeval form by Innocent III, Gregory IX and Innocent IV, the complete denial of religious liberty aroused little concern because it was not confronted by any appreciable attachment to individual values. Among the few more sensitive and profound mediaeval spirits who did rebel perhaps the most prominent was Marsilius of Padua, who in the first half of the fourteenth century tried to show that Scripture exhorted the faithful not to coerce dissenters but to instruct them and on the basis of this doctrine demanded the elimination of the secular sanction from ecclesiastical censure.

The reawakening of individualism accompanying the rise of humanism, the Renaissance and the Reformation exerted a decisive influence upon the genesis of religious liberty in the modern world. By emphasizing secular values humanism and the Renaissance helped to undermine the theocratic and conformist attitudes of the Middle Ages; even the most devout among their representatives, such as Erasmus, being believers by virtue rather of innate religiosity than of subservience to ecclesiastical authority, furthered the cause of tolerance. The Reformation, on the other hand, could hardly be described as a liberal force on the basis of its actual historical and institutional development. But, as Laboulaye has correctly pointed out (*La liberté religieuse*, 5th ed. Paris 1875, p. 81), religious liberty received a powerful impetus through the formulation and dissemination of the underlying principles of the Reformation, such as the right to rebel against an established ecclesiastical authority and to examine the truths of religion without restriction and the idea of a direct relationship between God and man obviating the necessity of mediation by a charismatic church. It is true that the larger reformed confessions, driven by their struggles with the church and the Catholic states to counteract the disintegrating force inherent in the doctrine of free examination by imposing inflexible standards of conformism, were hardly less intransigent and inclined toward persecution than the orthodox church. But it is also true that the force of the Reformation, far from being dammed up in two or three great dogmatic confessions, overflowed into a thousand channels of heresy, some of

which preserved the initial impulse in purer form. It should be noted moreover that the mere establishment of the reformed churches, by rupturing the previous politico-ecclesiastical equilibrium and plunging Europe into a century of impassioned wars, transferred the problem of religious liberty from the sphere of pure theoretical discussion to one of practical urgency. Since neither side was willing to yield, the inevitable outcome was a series of transactions and compromises between the fanatical antagonists, which ended in the return of peace on the basis of the more humanitarian norms of toleration.

The intellectual advance in the direction of religious liberty under the immediate inspiration of the Reformation may best be illustrated by the Socinians, a sect which had its chief center in Poland, although its founders, Lelius and Faustus Socinus, were Italians. Since the Socinians rejected the Calvinistic dogma of predestination in favor of free will, they found it possible to set a higher value upon the individual personality and consequently upon freedom. At the same time, however, they showed sufficient deference to the political authority so that at a later date they could be charged with Erastianism, a doctrine which derived its name from the German doctor Erastus, and which eventually became a generic term for state supremacy in ecclesiastical affairs. In Holland the principal supporters of religious liberty were Coornhert, who attacked the dogma of original sin and the legitimacy of persecution; Arminius, who gave his name to the sect of the Arminians (called also Remonstrants, from the protest issued by them in 1610 against Calvinistic intransigence); and, finally, the great jurist Hugo Grotius, who inspired the first edict of toleration promulgated in 1614 by the Dutch States General. In England the outstanding theorists of religious liberty included Robert Browne, the founder of Congregationalism, who taught that the church derives solely from Christ and that the state, when it attempts to intervene in church affairs, is Antichrist; the poet Milton, who favored toleration for all Protestant sects, although not for Catholics; the latitudinarian, Jeremy Taylor, who believed that Christianity could be reduced to a few universal principles dictated by reason or by nature and constituting a simple body of doctrine on which all men could agree; and the eighteenth century deists, conspicuously represented by John Locke, whose celebrated *Letter concerning Toleration* (London 1689) summarized and systematized the arguments forged in the bitter controversies of the

preceding centuries. With Locke liberty of conscience and of worship were natural rights and had not been surrendered by the social contract, which withheld religion from the sphere of the magistrate. However, by cautiously excluding from such freedom individuals or sects who professed either politically subversive doctrines or atheism, he left considerable scope for state intervention in ecclesiastical affairs. Despite the implications of his conception of the church as a voluntary association, his thought seems to have anticipated jurisdictionalism rather than separatism.

In France the emergence of a strong intellectual tradition in favor of religious liberalism, although apparently foreshadowed in a restricted sense by the monarchomachs and in a broader sense by Bodin, was prevented by the highly authoritarian policy of the seventeenth century monarchy. The first impetus came from a source hardly associated with the direct stream of French culture, the tracts of Bayle posthumously collected and published under the title *Traité de la tolérance universelle* (Rotterdam 1713). Here heterodoxy was defended from the syncretistic standpoint as a stimulus to emulation in the search of good and as the most appropriate, although still inadequate, expression of the infinite being, whose grandeur could be represented only in partial degree by any one religion. In contrast to Bayle's liberalism, which rested on an essentially religious appreciation of the positive and complementary value of all cults, the fulminations of the eighteenth century deists and *encyclopédistes* against intolerance arose from religious indifferentism. Yet the burning irony of a Voltaire, sometimes rising to impassioned denunciation, as on the occasions of the Calas and Sirven affairs (the pertinent documents are included in his *Traité sur la tolérance*, Geneva 1763), was of immense importance in furthering the progress of religious liberty.

The tardy appearance of a liberal school of thought in the German speaking countries may be attributed to the fierce religious struggles of the seventeenth century in Germany and to the success of the Counter-Reformation in Austria. Only the natural law school of Wolff and Thomasius ventured to present a theoretical defense of religious liberty. It was not until the enlightened despotisms of the eighteenth century succeeded in restraining religious fanaticism that the environment became propitious for the development of an extensive liberal litera-

ture. Among the notable documents of this period may be mentioned Lessing's drama *Nathan der Weise* (Berlin 1779) and Justinus Febronius' *De statu ecclesiae et legitima potestate romani pontificis* (Frankfort 1763), a combined plea for episcopatism and toleration which presented a liberal version of Erastianism and defined the basic principles of jurisdictionalism.

Spain and Italy, more firmly bound to the Counter-Reformation because of the activity of the Inquisition within their borders, remained outside the arena of conflict. Italy, which in the sixteenth century had been in the vanguard of the European intellectual renaissance, in the seventeenth contributed two great figures - Bruno and Galileo - to the martyrology of religious intolerance. In the eighteenth century, however, under the influence of the French Enlightenment, it began to resume its liberal function.

The practical realization of religious freedom in Europe, in the face of the resistance of established churches and of states interested in their perpetuation, lagged far behind the proclamations of the intellectual aristocracy. With the consolidation of the national states in the opening centuries of the modern era the mediaeval conception of the necessity of religious unity was incorporated in modified form into the grammar of statecraft, where it became indissociably linked with internal political unity. The basic premise that civil cohesion could not exist without religious unity, which received its classical although tardy expression in Hobbes, was implicit in the Peace of Augsburg of 1555, whereby Catholics and Lutherans in the German states effected a compromise according to the formula *cujus regio, ejus religio*; it was still discernible in the subsequent Peace of Westphalia of 1648, although the latter extended the formula to the Calvinists and mitigated some of the harsher practical measures of the Peace of Augsburg. Only gradually was this idea undermined by the more realistic theory, represented for instance by the French *politiques*, that an attempt to enforce religious unity would end not in political cohesion but in political disintegration. When in 1598 Henry IV of France issued the Edict of Nantes, which, although sanctioning the dominant position of Catholicism in the state, assured the Huguenots of security, freedom of conscience and admission to public office, it was in recognition of this opportunistic principle. The edict was, however, revoked in 1685 by Louis XIV, to be revived in a new and some-

what less liberal form in 1787 on the eve of the French Revolution. More permanent was the regime of toleration established with a similar objective in seventeenth century Holland, which became not only one of the foremost centers for the diffusion of liberal propaganda but an asylum for the persecuted of all European countries.

In England religious freedom underwent a vicissitudinous career. The Erastian policy of Elizabeth established a temporary settlement by permitting recusants to indulge in private worship but deprived them of certain civil rights. With the heightening of religious animosities in the seventeenth century, however, both Roman Catholics and nonconformist Protestants came to be looked upon with increasing suspicion, not only as opponents to the established Anglican church but as a menace to the political order by reason of the alleged papalism of the former and the anti-absolutistic doctrines of the latter. An important milestone was the constitution established by Cromwell in 1647, which, within the framework of jurisdictionalism, granted full liberty to all Protestant cults, while denying the slightest modicum of toleration to Catholics. The obsolescence of the theory of persecution was further foreshadowed by the Declaration of Indulgence issued by Charles II in 1672, benefiting both Catholics and Protestant dissenters and testifying to a growing conviction that a cessation of religious oppression was necessary both for internal peace and for the interests of commerce, because of the affiliation of a large section of the trading classes with nonconformism. The logical outcome of this conviction was the Act of Toleration issued by William III in 1689, which established a de facto toleration on the basis of jurisdictionalism for all except Catholics.

The enlightened despotism of Joseph II gave to the Austrian dominions, including the Austrian Netherlands and Lombardy, the Patent of Toleration of 1781, which while maintaining Catholicism as the official religion granted limited rights of worship and full civil liberties to adherents of the Augsburg and Helvetic confessions and of the Uniate Greek church. In Prussia the freethinking Frederick II introduced a regime of extensive toleration, which prepared for the territorial law of 1794, guaranteeing equal and full civil privileges to the Reformed, the Lutheran and the Catholic religions but withholding from other religious bodies the right to public worship and legal personality.

In America the convergence of the various liberal European currents under the changed conditions offered by a new continent produced a unique result. The Calvinist traditions of the Puritan settlers encompassed the two contradictory principles of theocracy and separatism, the choice between which had been conditioned by circumstances in the history of Calvinist sects. In Geneva, where the church had been able to attain an assured ascendancy, it had embraced the former principle; while in England under the tyranny of the Anglican church and in Holland, where they were confronted by more powerful native churches, Calvinist dissenters had renounced an impossible theocratic ideal for the independence inherent in separatism. Once in the comparative security of New England, however, the Calvinist fathers abandoned the liberal traditions of their immediate ancestry and instituted a regime of theocratic intolerance seldom paralleled. It remained for the more convinced apostles of liberty to revive the separatist doctrine. The first propagandizers of religious liberty in America were the Arminian Baptists, headed by Hanserd Knollys. More decisive was the work of Roger Williams, the indefatigable preacher and author of *The Bloody Tenent, of Persecution* (London 1644), the most important separatist tract to appear in America. Providence, which Williams founded, became a refuge for all victims of religious persecution. In 1663 the colony of Rhode Island was able to obtain from Charles II a charter sanctioning complete toleration for all religions, even non-Christian, and full civil liberty for all Christians. Another center radiating the spirit of religious liberty was the Quaker sect, founded by George Fox, whose doctrines were finally fulfilled in the colony of Pennsylvania by William Penn. Hardly less significant was the example of the Catholic colony of Maryland, which in 1649 issued the famous act of toleration, the first decree granting complete religious liberty to emanate from an assembly.

The American and French revolutions shifted the emphasis from the principle of mere toleration under the aegis of enlightened despotism to that of a more effective freedom and equality of worship. Article VI of the Constitution of the United States guaranteed that no profession of faith should be required for any public office or charge, and in the First Amendment Congress was denied the right to pass any law curtailing freedom of worship. Thus was cemented the American tradition of complete separation be-

tween church and state. With Mirabeau as its spokesman the French Revolution, in its first liberal phase, rejected the absolutistic principle of toleration in favor of complete freedom and equality of worship. The Declaration of the Rights of Man provided that no man should be molested because of any opinions, religious or otherwise, which he might express, provided that such expression did not disturb public order. In the later stages of the revolution, however, the absolutistic tradition was revived, at first in the form of the Civil Constitution of the Clergy, which carried Erastianism to its extreme conclusion, and during the Terror by the establishment of the *libériste* lay religion and the Robespierrian cult of the Supreme Being and by the persecution of all who remained faithful to the old religions.

The Restoration at the beginning of the nineteenth century signified the rise of the Catholic church, still preserving the intolerance of the Counter-Reformation, to a new if transient ascendancy. In the course of the century a series of papal encyclicals were launched against the rising tide of liberalism. Gregory XVI's encyclical *Mirari vos* of 1832 declared freedom of conscience in the lay sense to be freedom of error; Pius IX's *Quanta cura* of 1864 defined it as *libertatem perditionis*. The Syllabus of 1864 condemned religious freedom with the greatest trenchancy. In somewhat more reserved phraseology, but without modifying the purport of these proclamations, Leo XIII's encyclical of 1888, *Libertas proestantissimum*, acknowledged freedom of speech, writing and instruction but only when exercised for the furtherance of truth, which, it goes without saying, meant the truths of the Catholic religion.

The growing inflexibility of the Catholic church accelerated rather than retarded the movement for a complete emancipation from restrictions upon religious beliefs. By the creation and consolidation of the constitutional states during the nineteenth century religious liberty was everywhere transformed from a mere concession which could be revoked at will by the prince into a solemnly guaranteed and inalienable right secured by charters and by parliaments; and although in some states the statutes granting religious freedom were not radically different from the older concessions, the constitutional and parliamentary practises of these same states tended in time to endow them with permanence. Under the German Empire it became a fundamental law that while the

Evangelical church remained the official church of Prussia and of the dynasty, full rights should be accorded to Catholicism in Prussia and each of the other states should be entitled to make its own laws regarding the relations of church and state. In Austria, following the creation of the Dual Monarchy, complete liberty of belief was enjoyed by all individuals, although Catholicism was retained as the official religion and certain restrictions were preserved upon the collective activities of sects not officially recognized. Throughout Europe the old political disabilities based upon confessional affiliations—such as those inflicted upon the Catholics in England and upon the Jews in certain continental countries—gradually disappeared. The external constitutional guaranties were supported by a constantly more vigilant consciousness of the values which they aimed to secure; thus liberalism, with its respect for individual autonomy, and democracy, with its unwavering concern for judicial equality, gave substance to religious freedom. So long as the genuine liberal mentality lasted, jurisdictionalism sincerely aimed to restrict interference to an external guardianship of the public order and peaceful relationships of the various cults.

With the triumph of democracy in Europe in the second half of the nineteenth century there was a powerful recrudescence of anticlerical sentiment as an inevitable reaction against the clericalism of the deposed governments of the Restoration. By placing a premium upon disbelief anticlerical policy often violated religious freedom. This was particularly true in France, where the anticlerical movement culminated in 1905 in the separation of church and state. The jurisdictional principle was also abandoned for separatism in Wales by the acts of 1914 and 1919, in Spain by the new constitution of 1931, in the German Republic (1919-33) and, likewise under the influence of Social Democracy, even in post-war Austria. In England a periodic clamor and an imposing polemical literature in behalf of disestablishment have failed to accomplish their purpose.

But although the many variations of modern European policy have not infrequently cast a shadow upon religious liberty, they have on the whole failed to compromise any of its more fundamental bases. If the exceptions to this generalization include such flagrant examples as the antireligious intolerance of Bolshevik Russia and the persecution of the Jews in Hitlerite Germany, where, however, the immediate target

is rather a race than a religion, it nevertheless remains true that the principle of religious liberty as it affects both individuals and associated groups has in general resisted not only the clericalism which has cropped up in the post-war policies of many countries but the advent of dictatorial governments which have destroyed the foundations of modern liberalism and constitutionalism. No more eloquent testimony of the strength of religious freedom can be advanced than the fact that the Fascist government of Italy, despite its pro-Catholic policy, has improved the status of dissident religions by substituting for the mere toleration which they formerly enjoyed an explicit recognition of their liberties.

PROTESTANT.....	H. RICHARD NIEBUHR

ROMAN CATHOLIC. The Catholic church, as defined by its theologians, is the Christian society founded by Jesus Christ and governed after His death by the apostles and their successors. It is a society of the faithful organized under the authority of pope and bishops. The authority of the church, unlike that of civil society and of other religious associations, is defended not on the principles of natural law but rather on the basis of its supernatural origin, both in revelation and in the fact of its foundation by Christ. It does not represent a delegation of authority, either express or implicit, on the part of the Christian people; it derives from Christ through the mediation of the apostles. In the Middle Ages the bishops who exercised this authority were elected by clergy and people and in certain states at the present time they are appointed by the government; but neither procedure involves the conferment of ecclesiastical investiture. The latter can come only from consecration by another bishop, who alone is qualified to transmit the powers essential to the function and the divine mission received from Christ. Nor can any individual become a member of the ecclesiastical body except through baptism performed in the name of this authority. So long as the faithful remain in the church, they are subject to this authority, and they cease to belong to the church as soon as the authority excludes them. In brief, while the church is composed of two elements, the hierarchy and the laity, the latter are really part of the church only to the extent that they are admitted and maintained in this position by the pope and the bishops, in whom the sovereignty of the church is exclusively vested.

Such are the fundamental principles on which the constitution of the Catholic church rests and which make it, according to the terminology

used by theologians, a monarchy headed by the pope. This monarchy is absolute in so far as papal authority is derived solely from Christ, but at the same time it is limited, to the extent that the pope must govern with the assistance of Christ and of the bishops. This organization is adapted to the peculiar purposes of the church. The church considers itself the depository of a revelation entrusted to it by Christ, and this revelation must be preserved from contamination by any alien influence. It would be impossible to maintain the purity of its doctrines unless the hierarchy were sheltered from the vacillations and inconstancy of human opinion. The church aims to transmit divine life to human beings by assuring their admission into a state of grace with the aid of the sacraments which Christ established for this purpose. It cannot therefore admit for its authority a human origin. It claims to hold its power from God through a regular succession going back to the apostles and through them to Christ. "As the Father hath sent me, I also send you," Christ had said to His apostles; in their turn the latter sent out their own disciples, and it is this transmission of the divine mandate from generation to generation which constitutes the basic justification of the constitution of the church. The Catholic church therefore believes itself to be perpetuating in a real sense the presence of Christ throughout the centuries; and the pope, its visible head, is only the vicar of its invisible head.

Hence the religious institutions of the Catholic church are unique. It is not a voluntary association like so many of the ancient sects or like the modern Jewish or Protestant groups, in which the adherents of a certain faith deliberately create a group organization and delegate power to certain of its members. Similarly it

must be differentiated from the official tribal or state type of religion, such as the primitive oriental religions and the cult of imperial Rome. Precisely because it considers itself the depository of the divine revelation transmitted through Christ at a particular historical moment, it must necessarily be universal; herein lies an additional fundamental characteristic, although essentially it is a derivation from those previously enumerated. While maintaining assiduously the integrity of its doctrines, the church at the same time attempts through its missionaries to diffuse them throughout the whole world in order to assure to all men the benefits of divine life. In such circumstances the church cannot be identified with any state or with any political power; to the latter it leaves temporal power, while for itself it demands the plenitude of spiritual power unlimited either by geographical frontier or by political authority.

These characteristics have been present in the constitution of the church from the very beginning. The framework which supports the Catholic edifice has never changed; it has merely been consolidated by the addition of certain materials which have left the primitive structure essentially intact. The distinction between the two categories of Christians, the clergy and the laity, or the church governing and the church governed, constituted the basic principle of organization in the earliest Christian communities. In its statements regarding the primitive community at Jerusalem *The Acts of the Apostles* shows very clearly the juxtaposition of the twelve disciples, whose group was soon enlarged by the inclusion of the deacons and the elders, and the lay brethren, who were subject to the authority of the former. The same two fundamental elements are found in the communities created by St. Paul; here control over the laity was vested in the bishops or the priests who performed the function of instructing and protecting the orthodox doctrine. Moreover the oldest Christian documents, notably the letter sent by Pope Clement I to the church of Corinth in the closing years of the first century, authorized the bishops or priests to exercise their powers as the successors of the apostles by divine transmission; although they were elected by the communities, it was not from the community that they derived the authority which was inherent in their functions but from God Himself.

These are the most remote origins of the ecclesiastical hierarchy. In the course of the second

century the organization of the college of bishops and priests, although preserving its essential characteristics, became more clearly defined and simplified. In the first Christian churches, as is manifest from the epistles of St. Paul, the apostle who founded the community continued to supervise its activities from a distance. But the expansion of Christianity and the constantly growing demands upon the time of the apostles soon necessitated the creation of a permanent local leadership; hence one of the members of the college of elders, the bishop, was authorized to govern the church, while the other members, priests and deacons, became his councilors and under his authority exercised more or less specialized powers in the spiritual and the temporal sphere. Because of the scantiness of documentary evidence it is impossible to trace the stages of this development, which came to an end in the middle of the second century. In the letters of St. Ignatius each church is represented as being governed by a bishop, assisted by priests and deacons. By the third century the priests had come to concentrate chiefly on spiritual duties, while the deacons had charge of temporal administration. In the large churches there also existed at this time certain inferior classes of clergy: lectors, subdeacons, acolytes and ostiaries.

As the numerous individual Christian communities established relations with one another, certain churches began to assert their hegemony. In Africa, for instance, the church of Carthage acquired undisputed supremacy, as did that of Alexandria in Egypt. Sometimes such supremacy was defended on the ground that the church had been founded by an apostle; at other times it grew up merely because the church was located in the capital of a Roman province. By the fifth century the hierarchy of churches had become clearly outlined, at least in the east. There the bishoprics or dioceses were grouped into provinces, which in their turn were united into four patriarchates: those of Alexandria, Antioch, Jerusalem and Constantinople. Constantinople became preeminent among the other oriental patriarchates because of its position as the "new Rome." The west developed no real counterpart of the patriarchs or even of the primates, but the same division into provinces prevailed.

The process by which the Roman church established its primacy over all other ecclesiastical dignitaries, including the bishops, the metropolitans and the patriarchs, had its origins in the apostolic period. During the closing years of the

first century Clement (92-101), bishop of Rome, intervened to end a dispute among the members of the community at Corinth. At the beginning of the second century St. Ignatius of Antioch referred to the Roman church as "the church which presides over the brotherhood of love," that is, of the faithful. About 180 St. Irenaeus declared that the Roman church possessed *potentior principalitas*, because it had been founded by the apostle Peter, and he advised the other churches to follow its leadership. This assertion anticipated the decision of the council of Sardica (343), which vested in the Roman bishop the right to ratify or veto ecclesiastical pronouncements.

While the various branches of the ecclesiastical hierarchy were thus developing, another essential institution came into existence, the council or synod, which may be defined as an assembly of the heads of the church, convened for the purpose of deliberating and legislating on religious affairs. It was only after the Edict of Milan and the official recognition of Christianity by the Roman Empire in 313 that the institution became well established. After that date in addition to provincial councils, made up of the bishops of the particular province, and general councils, either Latin or Greek, there began to emerge universal, or oecumenical, councils, such as those held at Nicaea in 325 and at Constantinople in 381, which included the bishops of all lands. The rise of these assemblies is closely related to the great doctrinal controversies and schisms, which made it necessary for the church to define its beliefs in order to maintain the purity of the dogma.

The last of the ecclesiastical institutions to emerge was the parish. Although rural churches are occasionally mentioned in documents of the third century, they failed to become numerous until after the Edict of Milan. The reason for their tardy appearance is obvious: it was in the great municipal centers that Christianity first gained a foothold, and each one of these centers was originally organized into a bishopric in such a way that church and diocese coincided. But when other communities began to develop outside the municipality where the bishop resided, it became necessary to provide them with an organization. Apparently the first solution attempted was the installation of a bishop in each rural community, but the excessive parceling of authority involved in such a system had serious disadvantages. It therefore became the custom for the municipal center to send out from time to

time priests entrusted with temporary missions in the rural districts. But since this mode of evangelization proved inadequate for the purpose of coping with a persistent paganism, there was gradually created in the country areas a permanent clergy subordinated to the bishop. The city itself, the capital of the diocese, remained under the direct authority of the bishop until the urban revival of the tenth and eleventh centuries, when it became subdivided into a number of parishes, each administered by a priest.

The organization of the church in both the primitive period and the Middle Ages was adapted to the functions which it sought to perform and conditioned by certain recurring or acute problems which it faced in the performance of those functions. The primary objective of the church was the instruction and guidance of the faithful in the path of salvation. This it attempted to accomplish through preaching and the administration of the seven sacraments—baptism, communion, anointment or confirmation, ordination into the clergy, marriage, extreme unction and penance—all of which were based on the desire to perpetuate the teaching of Christ and to maintain among the faithful the moral discipline prescribed by the Gospel. At the same time it vigilantly guarded the traditional faith and discipline against innovation or non-conformism. Heresy, in the form of gnosticism, Marcionism, Montanism and Arianism, held far more peril for the early church than the imperial persecutions; and one of the gravest problems of the mediaeval church was its periodic reemergence, under the guise, for instance, of Catharism, Waldensianism, Albigensianism, Hussitism, Wyclifism and countless less famous or less widespread movements.

In addition to heresy the church was confronted by the problem of schism, which involved the withdrawal of certain Christians from its communion for reasons of discipline rather than of dogma. In the early centuries schisms were rife in Rome, Carthage and Egypt, but with the exception of the Donatist schism all were of brief duration. Far more serious consequences resulted from the permanent schism between the church of Rome and that of Constantinople. The origins of the eastern schism may be traced to the Council of Chalcedon in 451. Although recognizing the primacy of Rome, the council justified it on the basis of Rome's position as the capital of the empire; whereas the papal theory, as defined for instance by Pope

Leo the Great, based the primacy on the descent of the Roman bishopric from St. Peter. After 476, when Constantinople became the exclusive capital of the empire, its patriarchs, supported by the Byzantine emperors, quite naturally cited the Chalcedonian doctrine to prove their succession to the primacy formerly enjoyed by the fallen capital of the west. In the course of the protracted quarrel which followed between the churches of Rome and Constantinople, the Roman primacy was on several occasions confirmed by oecumenical councils, notably that held at Constantinople in 680. Yet the church of Constantinople obstinately clung to its aspirations for independence. The progressive orientalizing of the Byzantine Empire and the Islamic conquests of the Mediterranean basin, by erecting further impediments to economic traffic between the two sections of the Christian world, ultimately prepared the east for ecclesiastical separation. The schism, effected for a brief time by Photius during the pontificate of Nicholas I (858-67), was consummated in 1053 under the leadership of the patriarch Michael Caerularius.

In breaking away, the church of Constantinople took with it all of the other eastern churches grouped about it. As a result of the first crusade the patriarchate of Jerusalem was drawn under the sovereignty of the Latin church, but after the fall of the Holy City in 1187 and particularly after the Moslem conquest of Acre, the last Christian salient in the Holy Land, this amounted to no more than an empty title. A similar fate befell the other patriarchates at the end of the thirteenth century, when the disappearance of the Latin Empire in Constantinople destroyed the last vestiges of western influence in the east. During the succeeding centuries several attempts were made to reestablish unity between east and west, but none of them met with more than ephemeral success.

The problems of heresy and of schism together with the struggles between Rome and the Byzantine and Germanic empires go far to explain the various modifications which were introduced into ecclesiastical institutions during the Middle Ages, not by way of altering the essential features of the primitive structure but by way of clarifying and enriching it. The process of development was also conditioned by the expansion of Christianity in the west. Not satisfied with winning back those German tribes, such as the Goths, the Burgundians and the

Lombards, who had ranged themselves with heretics, the church set out to proselytize pagan peoples like the Franks. The difficulties which they encountered in the east obliged the popes to place increasing reliance on the west; during the pontificate of Gregory the Great (590-604) therefore the Roman church resolutely grasped the leadership of the missionary movement, which until that time had lacked method and coordination. The apostles who converted the English in the seventh century and the Germans in the eighth remained in constant touch with the papacy. The Slavic peoples were at first proselytized by both east and west, but after the eleventh century the work of evangelization in these regions was carried on exclusively by the German church in cooperation with the Holy See. In the thirteenth century the Christianization of Europe was completed and in the fourteenth the mendicant orders, the Dominicans and the Franciscans, having penetrated into Asia, won Georgians, Persians and Chinese for the Christian faith.

The most far reaching of the changes which took place in ecclesiastical structure under the impact of these various factors was the extension of the papal authority on which the constitution of the church rests. The Roman church had first, however, to secure its own independence by freeing papal elections from any interference on the part of the temporal powers (*see* PAPACY). Deferred for many centuries in the face of opposition from the Roman, the Byzantine, the Carolingian and the German emperors, who successively controlled appointments to the papacy, this objective was finally accomplished in the course of the reform movement of the eleventh century. Through the decree whereby Nicholas II in 1059 definitively transferred the right of papal election to the College of Cardinals, the Holy See gained the freedom from lay society which enabled it to consolidate its power over the universal church. Yet the succeeding development toward ecclesiastical centralization was but a continuation of a previous trend: it is in fact the dominant feature of the whole period between the sixth and the fourteenth century.

From the sixth century on, the expansion of Christianity was accompanied by the progressive accentuation of the tendency on the part of the various churches to consult the pope with regard to their problems and to abide by his decisions. Justinian himself recognized that the Roman church was head of all churches (*caput omnium ecclesiarum*) and the source of the sacerdotal

power (*fons sacerdotii*). Thus decisions emanating from the Roman pontiffs became the law of the church and in the canonical collections, such as that made by Dionysius the Little, papal decretals were vested with an authority equal to that of the conciliar canons.

These papal prerogatives antedated the False Decretals, which merely served to reenforce them by documentary material previously unknown or at least to provide the Holy See with an arsenal of trenchant formulae well adapted to aid it in the arrogation of power. The movement toward ecclesiastical centralization was foreshadowed under Nicholas I (858-67) and began to proceed with rapidity and intensity during the pontificate of Gregory VII (1073-85). After proclaiming that the Roman church had been founded by "the Lord alone" and invested in the person of Peter with power to "bind and loose" and with infallibility, the *Dictatus papae* issued by Gregory in 1075 asserted in principle the immunity of the pope to earthly criticism, the finality of his decisions and the absoluteness and universality of his power over the church and Christendom. Further it set forth the right of the pope to organize the dioceses in whatever way the enforcement of these principles seemed, in his opinion, to require: without recourse to a council the pope could depose bishops on his own authority, while the bishops were forbidden to render judgments on general matters except in the presence of the pope or his legates. Thus the *Dictatus papae* really contained a complete theory of the ecclesiastical hierarchy. In contemporary collections of canons, notably those made by Anselm of Lucca and Deusdedit, this theory was buttressed by a series of documents taken from the church fathers, the conciliar canons and the False Decretals.

The officials immediately subordinate to the pope were the patriarchs in the east, so long as the pope retained control in those regions, and the primates in the west. In the western church the only patriarch was the bishop of Aquileia, who retained his title until 1751 but enjoyed no real power. Although the office of primate existed, the powers accompanying the dignity never became clearly defined. From the pontificate of Gregory VIII on, both the patriarchate and the primacy were purely honorary. Beginning with the eleventh century the authority of the metropolitans also declined. The comparatively extensive powers previously enjoyed by the metropolitans or archbishops included the right to confirm bishops within their respec-

tive provinces, to convene and preside over provincial synods, to censure the suffragans and to hear appeals. At the end of the eleventh century all these prerogatives were transferred to the Holy See and the office of metropolitan became an insignificant cog in the ecclesiastical machinery.

The real intermediaries between Rome and the local churches were henceforth the legates, who acted as the plenipotentiary representatives of the pope. The origin of the legate goes back to the earliest times, for popes had always been accustomed to appoint members of the clergy as emissaries to distant lands or to select bishops, called in this capacity apostolic vicars, as the local representatives of the Holy See. In the eleventh century the enforcement of the reform decrees necessitated the more extensive use of legates. After the time of Gregory VII the institution was expanded to include, in addition to temporary legates appointed ad hoc for a particular mission, permanent legates who were chosen from the episcopate of a realm and took over the authority formerly exercised by the metropolitans. In the thirteenth century a distinction grew up between three types of legates: *legati a latere*, who were usually selected from the cardinalate and sent from Rome to direct important business in the name of the pope; the *legati missi*, who were generally recruited among the bishops and acted as permanent delegates of the Holy See; and the *legati nati*, purely honorary officials attached to some particular place. Not satisfied with supplanting the metropolitans, the papal legates played a crucial part in the progressive weakening of episcopal authority between the eleventh and fourteenth centuries.

As head of the local administrative unit, or diocese, the bishops, who represent the successors of the apostles, are, next to the pope, the most powerful officials in the church: the old adage *In episcopo ecclesia est* does not overstate the case. The bishop has exclusive right to ordain the clergy, to administer the sacrament of confirmation, to bless the sacramental oil and to consecrate churches. In addition he serves as diocesan administrator and judge of ecclesiastical cases, and as incumbent of the *potestas magisterii* he is entitled to instruct and to supervise instruction, although he usually delegates this function to a special official.

While by law the bishop is elected by the clergy and people of his diocese, confirmed by the king and consecrated by the metropolitan, this procedure has not always been followed in

practise. As soon as the temporal powers recognized the church, they claimed the right to appoint bishops and were more and more successful in imposing their demands until the tenth century, when the consolidation of the feudal regime throughout the west led to the alienation of this prerogative along with the other regalia. The inevitable effects of the incorporation of episcopal appointments into feudal procedure became apparent with the spread of simony and of Nicolaitanism, or moral laxity among the clergy, which sprang directly from simony. To eliminate these abuses and to raise the caliber of the clergy ecclesiastical reformers began to insist upon a return to the canonical modes of election. Such was the intention of Gregory's decree on lay investiture of 1075, forbidding any bishop to receive investiture from a layman and any temporal prince to invest with a bishopric or abbey. The resulting investiture conflict (*q.x.*) produced in the end a more precise definition of the respective rights of spiritual and temporal power. According to the terms of the concordats negotiated in the early years of the twelfth century between the church and the various European states, clergy and people retained the right to elect bishops, while the metropolitans consecrated them and the king or lord invested them with the temporal property attached to the bishopric. Subsequently the laity was divested of any share in episcopal appointments, which passed exclusively into the hands of the canons.

As early as the time of Gregory VII the place of the metropolitan as consecrator of episcopal elections was frequently taken by the pope or one of his legates. Such intervention on the part of the Holy See led gradually to a far more profound modification of the electoral system. The popes assumed the right to decide between rival candidates in the case of contested elections and to nominate a bishop in any city which they happened to visit while the office was vacant. In 1265 Clement IV arrogated to himself the right of conferring those benefices whose bishops died during their visits *ad limen* or within two days' journey from the city where the pope was at the moment residing. In the course of the fourteenth century the Holy See acquired control of episcopal appointments throughout most of the west and in addition nominated many of the subordinate officials within the dioceses. On the eve of the Great Schism the local authorities in the church had become closely dependent upon the Roman Curia.

The rapid progress of centralization had re-

sulted in the diminution of conciliar activity. Although the long interlude following the Council of Constantinople in 870 was interrupted by the convocation of the First Lateran Council (1123), which confirmed the papal reform legislation, both the Lateran Council and the seven oecumenical councils which followed it in the course of the next two centuries were summoned and directed exclusively by the papacy and had to be satisfied with affixing their seals to the decisions of the Roman church. The provincial councils, generally convoked by the papal legates, were restricted to promulgating the rules laid down by the Curia and providing sanctions against the refractory and the insurgent.

Although the popes of the thirteenth and fourteenth centuries had exclusive control over the general policy of the church, the bishops continued to wield considerable power as the undisputed heads of the local diocesan administration. In addition to the bishop the diocesan governmental machinery consisted of the canons, whom he usually nominated and who constituted his advisory council, and of subordinate officials, whom he named and discharged at will. The most important of these minor official posts was set up about 1180, the chief duty of the incumbent being to take charge of certain judicial affairs and to preside over the episcopal tribunal. The diocese was subdivided into archdeaconries and the latter in turn into deaneries. A local priest entrusted by the bishop with the task of transmitting his orders to a definite group of parishes, the dean supervised other local priests and periodically convoked a *synodus decanalis*, or rural chapter. The institution of the deanery was not, however, universal, and some parishes stood under the direct control of the bishop.

In the case of the parishes, which were the basic units within the diocese, a distinction must be drawn between those located in the cities and those in the rural districts. The growth of the urban parishes began with the economic renaissance and the attendant development of towns in the eleventh century. Since the cathedral could no longer adequately supply the religious needs of the community, subsidiary places of worship were established: the collegiate churches administered by the canons and the district churches, whose priests were appointed by the bishop with the consent of the municipality, if the town was organized as a commune. The rural parishes, on the other hand, were descended from the old private

churches. With the development of feudalism their patrons, the landowners, who had formerly reserved to themselves the right of naming the priests, adopted the custom of granting this right as a benefice along with other seigniorial rights. Thus the rural churches became fiefs exempt from all but very limited episcopal control. It therefore became one of the important objectives of the protagonists of the investiture struggle to free the rural parish from lay jurisdiction. Their efforts were crowned with success: the laity restored the churches which they had usurped and renounced their former extensive right of *dominium*, except in the very attenuated form of *jus patronatus*, which allowed them at the most to recommend to the bishop the nomination of a certain priest. During this period also, new rural parishes, distinct from those which had grown out of the old private churches, began to spring up; here either the bishop or the chapter or one of the chapter officials acquired the undisputed right of nomination.

The functions of the parish priest included not only the celebration of mass, the administration of the sacraments and preaching but the maintenance of order in the church and the parish, the latter involving certain judicial and policing activities. He enjoyed no fixed salary, deriving his income rather from the ecclesiastical revenue associated with each church and from certain extraordinary and variable emoluments. The tithe which was established to aid in his support was often alienated by infeudation, and the laity struggled vigorously before they surrendered it after the close of the investiture conflict.

A rigid hierarchical pyramid controlled entirely by the Holy See, the organization of the secular church became constantly more cohesive and closely knit between the eleventh and the fourteenth century. The social influence which radiated with increasing intensity from the church may be ascribed in part to these qualities, but in part also to the monks. At the beginning of the thirteenth century, when the expansion of Christianity and the progress of urbanization found the secular clergy unable to perform adequately the apostolic function of the church, the Benedictine ideal, which had fixed the pattern of western monasticism (*q.v.*) since the sixth century, was superseded by that of the mendicant orders, Dominicans and Franciscans. The prescription of solitude and isolation gave way to that of constant mingling with the masses; the ideal of personal holiness to be attained

through the mortification of flesh and spirit was supplanted by that of service in lay society. The Dominicans, as preachers and educators, and the Franciscans, primarily through their dissemination of the spirit of Christian charity, became valued lieutenants in the service of the papacy and were of tremendous assistance to the church during the period of its most profound influence upon secular life.

In the Middle Ages the two major problems with which the church had to contend were the preservation of internal unity and the opposition of the temporal powers. After the consummation of the eastern schism in the eleventh century the first problem came to revolve chiefly about the maintenance of the traditional dogma and discipline against the threat of innovation or non-conformism in the west. In the earliest centuries the church had developed the custom of punishing the repudiation of a fundamental dogma as well as the infraction of Christian morality with exclusion from the Christian community. Out of the primitive systems of punishments and censures there grew up the mediaeval institutions of excommunication (*q.v.*), which amounted to exile from the Christian world, and of interdict, which suspended the performance of all religious rites in a specified region, sometimes an entire kingdom. Excommunication and interdict were employed against heresy, while transgressions of discipline on the part of the clergy were punishable only with suspension or removal from office.

Because spiritual sanctions did not suffice to prevent heresy, the church early had recourse to temporal sanctions. As early as the fourth century the Roman emperor intervened to enforce conformity and Constantine Valentinian I and Theodosius issued a number of edicts against doctrinal rebels. The social radicalism associated with certain heresies served as an added stimulus to the civil power to intervene in a sphere which today appears entirely foreign to it. According to the theory of the "secular arm," which was generally accepted throughout the mediaeval period, the emperor or king, in his capacity as protector of the faith against error, was required to inflict corporal punishment upon those heretics turned over to him by the spiritual power, since a cleric himself is forbidden to shed blood. Greater regularity and system were introduced into the practise in the thirteenth century with the creation of the Inquisition (*q.v.*).

While the theory of the secular arm assumed cooperation between church and state, there

were other forces making for a far less amicable relationship. The collision between the interests of the church and those of the state was an inevitable consequence of Catholic doctrine and institutional organization and, more immediately, of the circumstances accompanying the official recognition of Christianity under Constantine. The precept of Christ "Render to Caesar the things that are Caesar's, and to God the things that are God's" implied that the church was to exercise its power only in the spiritual realm; but the very exercise of such power raised questions to which the temporal authorities could not remain indifferent. At the very outset the simple fact of Christian monotheism provoked a conflict with the Roman Empire. The stubborn refusal of the Christian cult to be assimilated into the Roman pantheon set it off from other sects in the empire and brought upon it official persecution. Furthermore Christian ethics involves a social ethic (*see* CHRISTIANITY), which inevitably has had repercussions in the political domain. Finally, the insistence of the church on the supremacy of the spiritual power over the temporal was a serious threat to established political institutions, while the organization of the Christian empire itself contained germs of incurable dissension.

After the recognition of Christianity by Constantine the church became a state institution, and the emperors in exchange for their protection assumed a right to interfere in ecclesiastical affairs and to act as judges in controversies, even of a doctrinal nature, which arose among the bishops. During the period after the Council of Nicaea in 325 Caesaropapism became more and more firmly established. At this stage, because the emperors held the Christian religion and the ecclesiastical hierarchy in high respect, harmonious relations generally prevailed between church and state and the transient conflicts were resolved in a manner which left intact the rights of the spiritual authority. But at the same time a precedent had been established which in the future was to exert an increasingly formidable and less beneficent influence upon the relations between the spiritual and temporal powers.

In the course of the fifth century the Roman Empire in the west virtually disappeared; the church had done little to save it. In spite of the benefits which had accrued to it from the protection accorded by the empire, the church had been compelled to set out upon an independent course of development. The work of evangelization, which was its chief preoccupation, forced

it to enter into relations with the barbarians. In the east, however, the Roman Empire persisted: the Byzantine *basileus* became the direct heir of the Caesars and perpetuated their ideas as to ecclesiastical politics. In the manner of Constantine and Theodosius, Justinian placed at the disposal of the Christian faith the imperial authority as well as the agencies and institutions through which it operated. But if he showed himself respectful and deferential toward the Roman church, whose assistance was useful to him in the realization of his project for a territorial reestablishment of the empire, he made it plain that he intended to dominate the church and subject it to his absolutism. Regarding himself as "emperor and priest," "vicar of God" and "supreme master of beliefs," the emperor felt free to intervene at will in ecclesiastical affairs: he promulgated laws governing the election of bishops and clerical ordinations, regulated the organization of convents, supervised the maintenance of discipline and even took part in doctrinal controversies. It was the emperor who convoked the oecumenical councils, determined their agenda and sanctioned or refused to sanction the enforcement of their decisions, although the papal legates, who occupied a conspicuous place at every conciliar meeting, also confirmed the decisions and tried to see that no one except the bishops meddled in questions involving doctrine.

Such far reaching claims resulted inevitably in a conflict with the papacy, which had been steadily gaining in power since the early years of the fifth century. The conflict was precipitated by the so-called "affair of the Three Chapters," in which Justinian set himself up as judge between the conflicting doctrines of the Monophysites and the Nestorians. In order to break down the opposition of Pope Vigilius the emperor made him a captive, had him conducted to Constantinople and in 548 forcibly wrung from him the *Judicatum*, a statement which gave approval to the imperial decree. Thus dramatically placing himself above the Roman church, the emperor set out to subordinate it to his sovereign authority and manifested his determination to be the supreme head of Christianity in the spiritual as well as the temporal realm.

The successors of Justinian maintained the same claims, but they came into conflict with a more determined papacy, which, thanks to the work accomplished by Gregory the Great, had at its disposal in the west new and valuable supports. Eventually the Holy See emerged vic-

torious in the violent conflicts which were waged between Rome and Constantinople during the seventh and the first half of the eighth century. The fall of Byzantine domination in Italy put an end to this first phase of the fight between *sacerdotium* and *imperium*.

The restoration of the Western Empire by Charlemagne in 800 revived Caesaropapism and thus restored the relations of church and state to the situation which prevailed in the days of Constantine, Theodosius and Justinian. In a famous letter addressed to Leo III shortly before 800 Charlemagne defined his conception of the reciprocal role of the two powers: the pope, he said, "will raise his hands toward God in order that by his intercession the Christian people shall be victorious in every quarter and at all times over the enemies of His Holy Name." By thus minimizing the role of the Roman pontiff Charlemagne felt himself free to assume many of the traditional papal functions; he drew up laws regulating the administration of sacraments, presided over the synods and imposed his own doctrinal definitions. In short, the emperor directed the church as he did the state.

After 962, when the Carolingian Empire, following its disintegration, was revived by Otto the Great, Caesaropapism again made its appearance. At times, as in the case of Otto III (983-1002), it might take a conciliatory form; on the other hand, as under Henry III (1039-56), it might be vigorous and aggressive, invading the rights of the church to the point of provoking a reaction on the part of churchmen. The action of Henry III in 1046 in deposing the three popes provoked Wazo, bishop of Liège, to remind the emperor that no one had ever enjoyed the right to depose the pope, since "the writings as well as the words of the Holy Fathers stipulated that the Sovereign Pontiff can be judged by no one except by God." New ideas were emerging as to the relations between the Roman church and the empire. Soon these ideas were systematically articulated and transformed into action. In the *Dictatus papae* Gregory VII proclaimed that the Roman pontiff was authorized, by reason of his powers to bind and to loose, to deprive emperors and kings of their crowns and to release their subjects from the oath of allegiance. It was no longer a question simply of the independence of *sacerdotium* from *imperium*, but rather a question of the subordination of the empire and other Christian kingdoms to the *sacerdotium*. Imperial Caesaropapism, determined to preserve its prerogatives intact, was confronted henceforth with

the antithetical doctrine of Roman supremacy.

The fight between *sacerdotium* and *imperium*, which was to last for more than two centuries, was merely a continuation of the struggle precipitated by the *Dictatus papae*. The German emperor Henry IV, refusing to recognize the doctrine of Roman supremacy postulated by Gregory VII, forced the German bishops assembled at Worms in 1076 to depose the pope; the pope in return formally deposed and excommunicated the emperor. The famous denouement at Canossa, although significant temporarily, did not resolve the basic antagonism which had arisen between the doctrines of imperial Caesaropapism and those of Roman supremacy.

This antagonism was reflected in the realm of ideas as well as in the sphere of action. In a variety of intellectual quarters the two divergent theses as to the relation between church and state were bolstered with the appropriate theological and legal arguments. The imperial thesis rested primarily on the formulae of Roman law which exalt the absolute power of the prince, as, for example, *Quidquid principi placuit lex esto*. Since, however, this argument was not sufficient to justify the imperial claims against the church, the theory of divine right was formulated on the basis of St. Paul's statement, *Omnes potestas a Deo*. Attributing to the imperial power divine origin, the theory concluded that the sovereign, holding his power directly from God, could not be subordinated to any other authority, even to that of the Holy See.

In opposition to the imperial doctrine of divine right the doctrine of Roman supremacy, first outlined in the *Dictatus papae*, was further developed by the canonists during the late eleventh and the early twelfth century with the aid of texts culled from the writings of the church fathers, from the conciliar decrees and from the False Decretals. According to the canonists and the polemicists the absolute power of the Roman authority to bind and to loose extends to the laity as well as to clerics, to kings as well as to bishops. They maintained that since excommunication involved the cessation of all relations with the excommunicated person, the excommunication of a temporal ruler must of necessity imply his deposition.

Although the doctrine of Roman supremacy rested primarily on a canonical type of argument, the Holy See also affirmed its power by making use of feudal law. From the second half of the eleventh century a certain number of

states which had no suzerain, as, for example, the Norman states of southern Italy, the kingdom of Aragon, the principalities of Kiev and Croatia and the seignior of Barcelona, became vassals of the Holy See and in recognition of this feudal relationship contributed a census. With the spread of this practise in the twelfth century the majority of the smaller states of Europe placed themselves under the suzerainty of the Holy See. Even some of the great kingdoms, such as England, proclaimed themselves, either willingly or unwillingly, vassals of the pope. The pseudo-Donation of Constantine was similarly used as a means of extending the temporal authority of the Holy See, which found solemn expression in the writings and acts of Innocent III and his successors. "I received from Rome," wrote Innocent, "the mitre, symbol of my religious function, and the tiara which confers upon me earthly domination." Pope Gregory IX reminded Frederick II in 1236 that by reason of the Donation of Constantine the pope not only exercised unlimited power over the souls of men, but that he had also obtained throughout the entire world *rerum et corporum principatum*, a temporal domination which made the emperor merely the delegate of the pope. The idea of papal supremacy quickly permeated mediaeval theology. Thomas Aquinas held that the "secular power should be subordinated to the spiritual power, as the body is to the soul." Humbert of Romans, in more explicit terms, declared that the emperors "receive from the Church the honor of their dignity"; and St. Bonaventura, after having recalled that the popes had deposed kings and emperors, concluded that the latter were merely auxiliaries of the Holy See in the administration of temporal affairs.

The fortunes of the struggle between church and state shifted back and forth. Under Urban II (1088-99) the papacy appeared to have conquered when the invasion of Italy by the German emperors was checked and the Christian Occident rallied enthusiastically to the pontifical appeal for the first crusade. Two later offensives, one by Henry V (1106-25), the other by Frederick Barbarossa (1152-90), began successfully but finally ended in defeat. The Roman power emerged from this latter crisis, which had seemed for a time to imperil its very existence, with greater strength than ever; and under the pontificate of Innocent III (1198-1216) the claims of the papacy were imposed with unprecedented vigor. Not content with affirming ab-

stract theses, Innocent arrogated to himself the right to act as arbitrator between the two princes then disputing the German crown and made it plain that the pope, being commissioned to consecrate the emperor, must satisfy himself as to the qualifications of the candidate.

Following the death of Innocent III the Roman supremacy suffered another rude assault, this time from Emperor Frederick II, the most redoubtable adversary encountered by the papacy during the Middle Ages. Drawing upon such students of Roman law as the legists Peter de Vineia and Thaddeus of Suessa, Frederick formulated a program of *dominium mundi* still more far reaching than that of Frederick Barbarossa in the preceding century. As Roman legal ideas fused with conceptions of oriental despotism, the emperor was led to consider himself a priestly ruler before whom the entire world should bow, one commissioned by God to lead the church in both the temporal and the spiritual spheres.

It is easy therefore to understand the bitterness of the fight between *sacerdotium* and *imperium* during the second quarter of the thirteenth century. After several severe clashes the papacy attained the most complete triumph which it has ever enjoyed over the temporal power; but at the very moment when imperial Caesaropapism seemed definitely crushed, the papacy found itself in conflict with newly formed national monarchies, which in their turn were loath to admit the doctrines of Roman supremacy.

The conflict with the national monarchies was of a different nature. The question of the *dominium mundi* was no longer involved; henceforth the pope claimed control over the king as well as over the emperor, *ratione peccati*. The new argument ran as follows: all kings, whoever they may be, are Christians, and as Christians they are called upon to submit to the orders of the church and to accept without question the authority of the universal pastor. As a corollary the pope felt justified in intervening in various ways in both private and public law. The church condemned the French kings Philip I (1060-1108) and Philip Augustus (1180-1223) for having presumed to dissolve their marriages. It also stepped in to make the princes respect the peace, in accordance with the Peace of God as promulgated in the tenth century; in the twelfth century at a time when the newly consolidated national monarchies were seeking to liquidate their quarrels through war, the papacy either

tried to prevent the conflicts or, as in the case of several clashes between France and England, served as arbiter.

But the issue which still continued to provoke the great majority of conflicts between church and state involved the question of what immunity, if any, was to be accorded ecclesiastical persons and property. Since the fourth century the clergy had been exempted by the Christian emperors from the obligation of performing municipal services and of paying extraordinary taxes; they had in addition the privilege of being tried only before ecclesiastical tribunals and of being exempt from lay jurisdiction of any kind. This privilege was carried over into the barbarian kingdoms, and in addition churches and monasteries received the right of imposing dues and taxes upon the inhabitants of exempt lands. Thus the church was freed from all obligations as regards both its personnel and its property and at the same time retained complete independence in matters of jurisdiction.

When in the twelfth century the national monarchies developed into absolutistic states, with administrative systems which needed ever greater financial resources, these privileges of the church began to appear unreasonable. The courts of the king, having absorbed the various local courts of the older seigniors, set out to supplant the ecclesiastical courts. Thus in England Henry II, by the Constitutions of Clarendon in 1164, ordered the clerics to appear when summoned before the royal judges. After a long conflict, however, the church succeeded in maintaining all of its claims, and in 1172 Henry II was forced to annul the act by which he had sought to suppress the privileges of the clergy.

Other conflicts broke out in the twelfth and thirteenth centuries, notably in the financial sphere. The tithes for the crusades were strongly opposed by certain rulers, notably by Edward I of England. In 1294 Edward ordered a subsidy equivalent to half of the ecclesiastical revenue; and in the same year Philip the Fair of France, in order to meet the expenses of his campaign against England, received from the bishops of the realm authorization to levy tithes over a period of two years to be used as he might see fit. A part of the clergy appealed to Rome; Boniface VIII, by the bull *Clericis laicos* of 1296, vigorously reminded the rulers of the privileges of the church and forbade such subsidies without the approval of the Holy See. The bitter fight which resulted between the pope and the king of France degenerated into a more general

conflict, which once again posed the question of the respective rights of church and state. In defending the traditional immunities of the clergy Boniface VIII reformulated, in even more trenchant terms, the doctrines of his predecessors as to Roman supremacy.

The bull *Unam sanctam* of 1302 contains in fact a theory of direct power more aggressive than that advanced by the popes of the thirteenth century. Boniface forcefully affirmed that the church controlled both swords, the spiritual and the temporal; and that if the civil power was distinct from the ecclesiastical power, it was nevertheless subordinate to it, since it was derived from the church. Boniface did not confine the sacerdotal power to the function of supervising the exercise of royal authority, *ratione peccati*. The state, he contended, was an organic part of the church and it was from the pope as vicar of Christ that all of its powers proceeded. Such theologians as Aegidius Colonna and James of Viterbo likewise proclaimed according to the formula *ad nutum, non ad usum* that the temporal power, even though it may not rest in the hands of the pope, is at least dependent upon his orders.

Such doctrines naturally aroused violent resistance. In the face of the papal theory the legists of the Capetian line took over from the jurists of the Holy Roman Empire the theory of absolutism based on divine right. At the beginning of the fourteenth century the two theses which had been arrayed against each other uninterruptedly since the time of Gregory VII were still in conflict; but the sphere of the debate had become enlarged. While the Holy See maintained its right to govern the world in both the spiritual and temporal spheres, the absolutistic national monarchies were seeking to emancipate themselves from its supervision, and in this endeavor they were to be aided by historical conditions. During the Avignonese period (1305-78) the only positive success registered by the nationalistic antagonists of the papacy was the Golden Bull, which freed the empire from all interference on the part of the popes. But the Great Schism of the west involved the papacy in a crisis of unprecedented gravity. This schism was basically responsible for the conciliar movement, which for a time seriously threatened the papal institution, as well as for the successful efforts of many temporal sovereigns to place the national churches under their strict supervision.

The origins of this crisis are to be traced to the double election in 1378 of Urban VI and of

Clement VII. Since it was impossible to establish in canonical terms the legitimacy of either of these claimants, there followed throughout the Christian world a period of grievous uncertainty. Inasmuch as the two pontiffs consistently refused to abdicate simultaneously, a number of theological leaders decided that the only way to restore unity was by means of an oecumenical council. Their recommendation to this effect, although patently contrary to canon law, which recognizes no oecumenical council unless presided over by the pope and no conciliar decisions unless promulgated by him, resulted in the Council of Constance (1414-18) and the election of a pope who was accepted by the entire Christian community. The pontifical authority, already weakened by these prolonged disturbances, was further threatened by other factors, particularly the spread of heresy, which was particularly aggressive in its antipathy to the papacy. Wycliffe, for example, advocated the suppression of the Apostolic See, repudiating its infallibility and advocating the substitution of the authority of Scripture.

The conciliar movement became increasingly strong during the years which followed the Council of Constance. The Council of Constance, in adopting the principle that oecumenical councils should be held at stated intervals, in itself represented a limitation on the exercise of papal discretion; and had gone even further in proclaiming the superiority of the general council over the pope. The Council of Basel (1431-49) attempted to carry over into practise the principles adopted at Constance. It soon became involved in a stubborn conflict with Pope Eugene IV, who finally dissolved the now openly schismatic assembly. Although orthodoxy was finally restored, the effect of this bitter controversy had been distinctly injurious; the temporal powers quickly took advantage of it to usurp from Rome a goodly measure of the control of the national churches.

During its final sessions the Council of Constance had approved various concordats designed to regulate the position of the church in Italy, Spain, France, Germany and England. In every case a part of the revenue and of the prerogatives of the Holy See had been turned over to the temporal princes. Although originally concluded for only five years, these concordats were renewed and their general tone became increasingly antipapal. In 1438 the French king Charles VII, profiting by the crisis at Basel, convoked at Bourges a large assembly of the clergy,

which confirmed the decrees of Basel and declared that it saw no good reason why the king or the princes should not occasionally interfere in episcopal elections "through tender prayers or well intentioned recommendations." The decisions of the assembly, promulgated as the Pragmatic Sanction of Bourges, remained in effect, despite Louis XI's formal annulment in 1461, until 1516 and paved the way for the increasing participation of the temporal power in the affairs of the church, notably in the matter of episcopal elections.

A similar evolution may be traced in Germany and in England. In Germany the convention of Vienna in 1448 limited to six months of the year the power of the pope to dispose of benefices which had been vacated by bishops who had died while making a visit to the papal court; and at the same time ratified the usurpations made by the princes during the crisis. In England the papacy was likewise forced to accept the king's incursions into the sphere of ecclesiastical property. Throughout Europe centralization declined; and as royalty extended its jurisdiction, the authority of the pope over the local churches became perceptibly weaker.

At the beginning of the sixteenth century this decline in the power of the Holy See became even more marked. The prestige which the Catholic church had enjoyed throughout the Middle Ages was seriously undermined by the nepotism which prevailed under Alexander VI (1492-1503), Julius II (1503-13) and Leo X (1513-21), by the pagan atmosphere which often saturated the pontifical court during the High Renaissance and by the reappearance of older abuses. The situation was greatly aggravated by the Reformation (*q.v.*) and the attendant defection of a huge number of the faithful. Accordingly the pontiffs beginning with Adrian VI (1522-23) made a vigorous effort to regenerate the church. In the thorough overhauling of ecclesiastical institutions the Curia was reformed, the cardinals and the bishops were recruited with much greater care and instructed to take up actual residence, and the itinerant monks were ordered to return to their convents. The Council of Trent (1545-63) completed the work of the popes by introducing a standardized dogma and inaugurating a general reform of the church. According to the decrees of this famous assembly the bishops were instructed to maintain strict residence, to have themselves consecrated during the first three months following their election, to pay regular visits to their

dioceses and to supervise the benefices belonging to exempt chapters. Diocesan synods were to be summoned annually; seminaries were to be created for the education of young clerics; plurality of benefices was prohibited; and a goodly number of taxes which had led to abusive modes of collection were suppressed. As regards the regular clergy the council forbade monks to have any property, prescribed an investigation into the condition of monasteries and decreed that abbeys should not be given in commendation. The regeneration of existing religious orders—for instance, the reform of the Carmelites by St. Teresa de Avila—and in particular the foundation in 1534 of the militant Jesuit order (see JESUITS) were of tremendous importance for the prosecution of the work of the Counter-Reformation.

Although a new and more vital period in the history of Catholic religious institutions was thus ushered in by the Protestant Reformation, no essential element of the constitution of the church was changed and the authority of the papacy was fully restored. The Council of Trent, before adjournment, submitted all of its decisions to Pope Pius IV for his approval and turned over to the papacy the task of settling any questions that might arise in the execution of the conciliar decrees. More than ever the church preserved its character of a highly centralized monarchy; and as the administrative and judicial machinery set up in the twelfth and thirteenth centuries became antiquated, new machinery was constructed which fortified still further the authority of Rome. The most striking characteristic of Catholic religious institutions in the modern period is the appearance—alongside of the Consistory, the body of cardinals serving as advisers of the papacy—of Roman congregations which tended more and more to take over the actual administration of the church. A congregation may be defined as a group of cardinals designated by the pope to supervise a particular branch of ecclesiastical administration and to serve as specialized heads of the administrative bureaux. In general the organization is analogous to that of a ministry in a modern state. The effect of the Roman congregations, which number eleven at the present time, has been to accentuate centralization.

During the modern period therefore even more than in the Middle Ages the church exists only as a reflection of the Holy See. The Council of Trent introduced no modification in the relations existing between the pope and the local

churches, but it did forcefully affirm that it was the pope who conferred the episcopal office. Although it has been decided, as, for example, in such concordats as those of 1516 and 1801 with France, that this right of nomination under certain circumstances can be delegated, neither nomination by secular officials nor election by the local clergy has been a normal practise in recent times. Today the great majority of episcopal seats are filled by free pontifical collation; the concordats of the twentieth century have made it plain that the right of the national governments extends only to review, that is, to the expression of a demurrer in the case of a nominee who for political reasons may be unacceptable. This system, which obtains practically everywhere at the present day, has made the bishops more dependent upon the Holy See. Papal intervention in the government of the local churches is far more extensive than in the Middle Ages: the bishops are required to present themselves at regular intervals at the papal court in Rome and every five years they must furnish a detailed report as to the situation in their dioceses. The Holy See exercises an even more direct authority in countries recently won to the Catholic faith through missionary enterprise, which is organized and administered under the jurisdiction of the Congregation of Propaganda.

Thus the church is a spiritual monarchy of which the pope is absolute sovereign. But inasmuch as Catholics are also subject to national states, which are in a position to grant or withhold religious liberty, and since these states have become progressively secularized, the papacy has been forced to erect machinery for regulating its relations with the political powers. One of the distinguishing characteristics of the modern period has been the existence of a pontifical diplomatic corps, closely resembling those of the secular states. The secretary of state, an office created in the sixteenth century, heads the corps and supervises the activity of the nuncios, permanent ambassadors who have superseded the mediaeval *legati a latere*.

Since this double organization, at once religious and political, has produced happy results, the Catholic church has made notable progress during the modern period. The various clashes which have inevitably arisen with the nation states have been neither as bitter nor as prolonged as those of the Middle Ages. The first of these conflicts was fomented by the Council of Trent itself, which through its decrees reestablishing the Catholic discipline ap-

peared to encroach upon the authority of the state. Although accepted without difficulty in Italy, Poland, Spain and the other countries subject to Philip II, these decrees aroused opposition elsewhere. In Germany, where a counter offensive against the Reformation was particularly imperative, the Catholic rulers were acquiescent enough but the bishops themselves resisted the orders, which bade them renounce temporal interests in order to identify themselves with the intellectual and moral elevation of the clergy. The greatest opposition to the decrees of the Council of Trent emanated from France, where the clergy, supported by the king, charged that the decrees were contrary to the liberties of the Gallican church. The papacy had to be satisfied with a rather vague, and never officially promulgated, promise of conformity on the part of the assembly of the clergy in 1615.

The Gallicanism which prompted the French opposition to the decrees of the Council of Trent was developed into a systematic theory at the end of the sixteenth and the beginning of the seventeenth century by Pierre Pithou, Edmond Richer, Pierre and Jacques Dupuy. The formulation of such theses was appreciably forwarded by the progress of monarchical absolutism, which was consistently hostile to ultramontanism. In 1682, under Louis XIV, an assembly of the clergy in order to comply with the wishes of the king, who had had difficulties with the Holy See, adopted the Declaration of the Four Articles, which proclaimed the superiority of the council over the pope and the independence of the French clergy from the Holy See. Gallican doctrines eventuated in a genuine schism. Although in the end Louis XIV had to give in to Rome and the schism was healed, the Gallican spirit still continued to animate the French monarchy. Traces of it may be detected in the controversy over Jansenism, which, having been condemned by Rome, gave the French government the opportunity of attacking the papal authority without adopting an altogether clear position. The suppression of the Jesuits in France in 1762 was the result of pressure which was exerted by the Jansenists in alliance with the *parlements*.

A similar opposition to ultramontanism may be traced in the other Catholic states. At the end of the eighteenth century the German bishops came under the influence of Johann Nikolaus von Hontheim, more familiarly known as Justinus Febronius, who maintained that ecclesiastical authority inhered not in the pope but in the

assembled bishops. During this same period Emperor Joseph II sought to detach the Austrian church from pontifical authority with a view to bringing it under his own control, and Pope Pius VI was unable to suppress these measures, which were so manifestly directed against his position. Tendencies similar to Gallicanism and Josephism appeared also in Spain, in Portugal and in the Kingdom of Naples, where the rulers attempted to supplant the pope as head of the church and to prohibit the bishops from corresponding with Rome. Under Grand Duke Leopold an attempt was made to introduce Josephism into Tuscany.

The offensive against ultramontanism is intimately related to the spread of religious skepticism. In seventeenth century England the deists began to deny the supernatural character of Christianity and to formulate a religion based exclusively upon human reason. In crossing to the continent these anti-Christian ideas eventuated in pure atheism. Although such theologians as Le Franc de Pompignan and St. Alphonsus de Liguori attempted to defend the position of the church in the fields of philosophy, history and exegesis, the clergy itself was not sufficiently enlightened to help and the episcopate, controlled by the great families, was not equal to the task. The controversy against the atheists was carried on far more effectively by the religious orders. Dominicans, Benedictines, Oratorians and Jesuits rivaled each other in the intensity of their counter offensive. But even so the church was not able to forestall the crisis.

The French Revolution wrought serious havoc on the religious institutions of France. On the night of August 4, 1789, the Constituent Assembly by abolishing feudal rights suppressed the tithe; and on November 2 the remaining ecclesiastical properties, upon the proposal of Talleyrand, bishop of Autun, were nationalized. In 1790 the religious orders were suppressed. The Civil Constitution of the Clergy adopted the same year recast the ecclesiastical map of France and gave the electors the power to choose the priests and bishops, who in addition were forbidden to receive canonical investiture from the pope. The resulting overthrow of canonical law precipitated a civil war which lasted until 18 Brumaire. The revolutionary crisis broke out also in the countries overrun by the French revolutionary armies, particularly Germany, where the church was despoiled through the secularization of ecclesiastical property completed in 1803. The invasion of the Papal States

by the French armies in 1796 resulted in further loss of papal properties.

Although the papacy itself suffered a serious crisis under the later Napoleonic empire, a settlement of most of the major issues was reached by the Concordat of 1801 between Napoleon and Rome. By guaranteeing state support for the secular clergy in return for the renunciation by the church of its ecclesiastical properties the concordat facilitated the resumption of amicable relations between church and state. A similar solution was reached in the concordats with other countries: with Bavaria in 1817, the Kingdom of Naples in 1818, and Russia, Switzerland and most of the German states during the course of the nineteenth century.

In general the effect of the concordats was highly beneficial. Momentary misunderstandings of various kinds subsequently arose with Catholic as well as with Protestant countries, but invariably, after a few years of tension, a satisfactory solution was evolved. On several occasions such difficulties appeared in Germany, notably the affair of the mixed marriages in Prussia during the reign of Frederick William III, and the *Kulturkampf*, which broke out after the proclamation of the German Empire in 1871. As a result of the revolutionary movement of 1848 certain Italian states imposed limitations upon ecclesiastical jurisdiction and suppressed religious congregations. The entrance of King Victor Emmanuel into Rome created a delicate situation which continued down to 1929. In France by way of reaction against certain royalist demonstrations and the coup d'état of May 16, 1877, the republican government adopted an anticlerical policy, which found its most striking expression in the law of 1901 relating to religious congregations, in the severance of diplomatic relations with the Holy See and in the separation of church and state in 1905. Diplomatic relations were resumed in 1921 and an acceptable *modus vivendi* was established under the separatist system.

In spite of these conflicts with the various national governments the power of the Holy See has increased during the course of the nineteenth and twentieth centuries. The proclamation of papal infallibility by the Vatican Council in 1869-70 strengthened its religious authority, while its attitude toward contemporary social, intellectual and international problems has served to augment its general prestige. Thus Leo XIII (1878-1903), in an effort to mitigate the

hardships of the working classes, issued his encyclical *Rerum novarum* (1891), which denounced "the new forms of usury" and advised the workers to organize into trade unions in order to obtain fair salaries, Sunday rest and other advantages demanded by justice and charity. The same pope advanced the interests of science by founding the Biblical Commission for the study of Holy Scripture, by opening the Vatican for general research purposes and by creating numerous chairs of philosophy. The social and intellectual reforms of Leo XIII were carried further by the work of Benedict XV (1914-22) and Pius XI (1922) in promoting international good will. Benedict, after making repeated attempts to act as arbitrator during the World War, issued the encyclical *Pacem Dei* in 1920, which pleaded for reconciliation between the Christian nations of the world - a goal which Pius XI has of late been zealously pursuing. In the intellectual realm Benedict was responsible for the *Codex juris canonici* of 1917 and for the creation of the Congregation of Seminaries and Universities. Pius XI has given a powerful impetus to missionary work; the fact that the pope personally consecrated six Chinese bishops in 1925 is indicative of a new trend in this respect.

The Catholic church has thus become a powerful influence in the present day world. Although it is in fact as well as in name a universal church, its influence obviously varies in different regions. In Italy, where the population is almost entirely Catholic, Catholicism is the state religion and, particularly since the entente of 1929, enjoys a most privileged position. Religious instruction is given in the schools, and since 1921 there has been a Catholic university in Milan. In Spain also, at least until quite recently, Catholicism was the state religion and the immense majority of the population had received baptism. The recent revolution, however, was anticlerical in temper, and a number of convents and churches were burned. But at the present time there are prospects of a new statute which will guarantee religious liberty. France, for all its aggressive anticlericalism during the opening years of the twentieth century, has preserved an intense religious vitality. The generosity of the Catholic laity not only assures the support of the secular clergy, who no longer enjoy state support and at the same time are deprived of the revenues deriving from pious foundations, but also maintains charitable and apostolic organizations. There are few countries in which Catholic societies are more prosperous.

In Belgium, where the majority of the population is Catholic, Catholicism exerts a political influence greater than in any other country. An extensive program of social legislation, incorporating Christian ideas, was sponsored and passed through the efforts of the Belgian Catholic party. The Catholic University of Louvain since its reopening in 1834 has rendered immense services to science, particularly in the fields of religious philosophy and history.

Elsewhere in western Europe—except in Portugal, where the church has suffered as a result of the revolution of 1910—Protestantism is in the ascendancy; but even in Protestant countries Catholicism as a rule enjoys real liberty of action. In the Netherlands, since the law of 1853 inaugurating complete religious liberty, the Catholic hierarchy has become reestablished and the security of ecclesiastical property has been guaranteed. Catholicism may be taught in the schools, and in recent years a Catholic university has been founded at Nijmegen. In the United Kingdom of Great Britain and Ireland the position of Catholics has gradually improved. The Catholic hierarchy was restored in England in 1850 and in Scotland in 1878; but since the law forbade the presence of a Catholic bishop in the cities where Anglican bishops were already in residence, the Catholic archbishops have been located in the newer urban centers, such as Liverpool, Birmingham or Cardiff. The dioceses are divided not as formerly into parishes but into missions, the clergy of which, regular as well as secular, are appointed by the bishops. Catholics are allowed to have the so-called "incorporated schools," three quarters of whose expenses are paid by the government in exchange for governmental control. Ireland has remained predominantly Catholic and its dioceses are divided into parishes.

In Germany the majority of the inhabitants in the Rhineland provinces and in Westphalia, Silesia and Bavaria are Catholic. Formerly each of the states determined its own religious organization, but, as a result of recent developments consecrated in the Concordat of 1933 between the Hitler government and the Holy See, a striking unification of religious institutions has been brought about. In Switzerland each canton is free to adopt whatever religious organization it may prefer, although it must accord at least a minimum degree of liberty. The religious situation in most of the succession states as well as in Rumania and Poland is regulated by recent concordats. In Austria, Czechoslovakia and Poland

the population is still predominantly Catholic. In 1925 Latvia and Lithuania were erected into ecclesiastical provinces; while Finland and Estonia as well as the overwhelmingly Protestant Scandinavian countries are administered by apostolic vicars and treated as missionary areas.

In the New World the Dominion of Canada has a large proportion of Catholics in the French speaking provinces. Catholic schools are particularly prosperous and Laval University at Quebec and Montreal is a famous center of higher Catholic culture. In the United States, where the constitution prescribes religious liberty, the actual legislation is in the hands of the states, which as a rule have manifested an extremely liberal temper. Freedom of instruction is universal, and the state recognizes the degrees conferred by Catholic universities. As a result of this tolerant regime the number of Catholics has grown from 40,000 in 1790 to around 20,000,000 in 1934.

The situation in Mexico is quite different and has recently moved the Holy See to vigorous protests. Similarly in the other Latin American countries the recurring revolutions during the nineteenth and twentieth centuries have hindered the progress of Catholicism, although in certain countries, notably Brazil, it is still fairly alive. Asia, Africa, with the exception of French north Africa, and most of the islands of the Oceania archipelago fall within the category of missionary regions. The work of proselytization in these areas is being carried on with extreme vigor (*see* MISSIONS), although because of the tremendous obstacles in its path the numerical results are not uniformly impressive.

Missionary activity is only one manifestation of the vitality of the Catholic church at the present time. Catholic societies of all kinds were never so numerous or so active as in the twentieth century. Charitable organizations deserve especial mention because they embody the essential precept of Catholicism. The Society of Saint Vincent de Paul, founded by Ozanam in 1833, and now extending throughout the world has done much to improve the lot of the working classes. In addition there are the Association of the Holy Childhood, which cares for 500,000 children annually; numerous organizations for the moral and social training of youth and for the furtherance of education; press associations; and professional organizations, such as the Christian trade unions; as well as the huge propaganda societies and the various associations for religious and pious purposes.

In recent years the Catholic church has made conciliatory overtures both to the Greek Orthodox and to the Anglican churches. These efforts, however, have as yet proved abortive. The great stumblingblock in the way of all reconciliation is the theory of Roman primacy, which the Catholic church cannot sacrifice, even in the smallest degree, without endangering the entire ecclesiastical structure. But this doctrinal intransigence does not prevent the church from collaborating for humanitarian and cultural purposes, both with other Christian churches and with lay institutions which are interested in the preservation of peace or in the improvement of the lot of the working classes. By its cooperative spirit it has won the respect of many non-believers; and if today, as a result of past revolutions and the confiscations which not infrequently accompanied them, the material position of the church is weaker than it once was, its moral influence has perceptibly increased.

AUGUSTIN FLICHE

EASTERN ORTHODOX. *Byzantine.* In the east the organization of the primitive church followed the administrative divisions of the Roman Empire even more closely than it did in the west. By the end of the third century every community which was accorded the status of a town (*civitas*) under the Roman administrative system was served by a single bishop, who acted as head of the one local church; independent churches in all other communities were suppressed, along with the bishops (*episcopoï*) in charge. In further conformity with the principle of adaptation to existing administrative divisions ecclesiastical provinces were set up which corresponded exactly to the political. The oecumenical and local councils of the fourth century decreed that the various episcopal seats in the province should be represented in a synod and that the bishop of the capital city, under the title of metropolitan, should preside over the new unit.

With the establishment at a somewhat later date of larger administrative areas within the empire there grew up in the east five ecclesiastical divisions (called dioceses): Egypt, Orient, Asia, Pontus and Thrace. At the head of these dioceses stood the bishops of the respective chief cities: Alexandria, Antioch, Ephesus, Caesarea (in Cappadocia) and Heraclea. These bishops, or "exarchs," as they were called, summoned and regulated the local councils in addition to appointing and consecrating the metropolitans. The exarch of Alexandria by reason of his spe-

cial prerogatives appointed all bishops as well. As a mark of special respect this exarch was called pope and judge of the world, while the exarch of Antioch had the title of patriarch, the name which was later to be assumed by the bishops who headed the most important autocephalous churches of the east.

The rapid political rise of Constantinople, however, soon brought to an end the regime of the five exarchs, which was eventually replaced by four patriarchates: Constantinople, Alexandria, Antioch and Jerusalem. Asia, Pontus and Thrace became part of Constantinople; Antioch rapidly lost power, particularly after the separation of Jerusalem; and by the fifth century Alexandria alone was powerful enough to stand out against the aggressive patriarch of Constantinople. After a protracted struggle, which involved such distinguished hierarchs as Gregory of Nazianza, John Chrysostom, Nestorius and Flavian, the patriarchs of Constantinople emerged victorious and by the provisions of the canons of Chalcedon were accorded concurrent jurisdiction throughout the Eastern church. From the sixth century on the patriarch of Constantinople like the pope of Rome began to advance claims to hierarchical primacy.

After the conquest of Alexandria, Antioch and Jerusalem by the Arabs in the seventh century and the consequent elimination of all rivalry in the east, the chief opposition to the claims of the patriarch of Constantinople came from the west. The bitter controversy between Rome and Constantinople, which goes back to the days of Pope Leo the Great (440-61), and which from 484 to 518 created an open schism between the Western and Eastern churches, failed to weaken the power of the patriarch. During the iconoclast struggle he even profited by the opposition of Rome, since it provoked Emperor Leo the Isaurian (717-41) to transfer to him the dioceses of Illyricum, Calabria, Sicily and Crete previously under papal control. The same emperor detached Isauria from the jurisdiction of the patriarch of Antioch and subordinated it to the patriarch of Constantinople. He further decreed that all churches in territories whose inhabitants had recently been converted should be subject to the authority of the patriarch of Constantinople. Yet, while he was undeniably the most powerful religious leader in the east, the patriarch of Constantinople held, even in theory, a less exalted position than that of the pope. Aspiring only to primacy in the east, he was willing to grant, in the event of union between the two

branches of the church, the papal pretensions to primacy over both east and west, although he interpreted the latter as a primacy of rank and not of jurisdiction.

Nor did the patriarch ever acquire the actual authority over the other eastern churches which the pope exercised in the west. None of the other autocephalous churches was subject to his direct superior jurisdiction, and at best he was allowed merely concurrent jurisdiction. Whereas no other ecclesiastic or body of ecclesiastics was entitled to judge the actions and dicta of the pope, the patriarch of Constantinople like other patriarchs could be judged by a council consisting of the dignitaries of his own territory together with the other patriarchs. In general the supreme organ of the Eastern church was the council, not the patriarch. Even in its juristic basis the power of the patriarch of Constantinople was less exalted than that of the pope. In contrast to the papal authority, which was buttressed by divine law, the priority of the patriarch rested only on human law and was defended in the canons on the basis of the political importance of the capital city, in which the seat of his office was located.

In its relations with the state the Byzantine church, both in its characteristic theory and in practise, aimed at cooperative harmony, so interpreted that normally no line of demarcation existed between the sphere of the ecclesiastical power and that of the political. At various periods the Byzantine emperors not only supervised the maintenance of ecclesiastical discipline but even controlled matters of church doctrine. In addition to the emperors the various subordinate civil officials participated in the direction of ecclesiastical affairs, while on the other hand purely political functions were performed by the bishops.

This overlapping of the two spheres did not remain, however, entirely free from criticism. Particularly at the beginning of the Byzantine epoch, various eminent hierarchs, such as Chrysostom and Gregory of Nazianza, insisted upon the superiority of the sacerdotal power over the political. But, although Arcadius and Honorius as well as many other early emperors did in fact renounce their right to interfere in purely ecclesiastical affairs, at a later period disturbances arising from the prevalence of heresy impelled the emperors to revive the practise of intervention. Thereafter the system of Caesaropapism, characterized by the dominance of the emperor in both ecclesiastical discipline and

doctrine, became firmly intrenched. Following out a precedent established as early as the Arian and Monophysitic controversies, Justinian asserted his authority over doctrinal questions by condemning the Origenists and the "three chapters" in a series of edicts, which were provided with a thoroughgoing theological rationale. The system of Caesaropapism was completely formulated in the *Ecloga* of the eighth century. One of the lawgivers who compiled the *Ecloga* referred to himself as king and priest, identifying his will with canon: in the introduction to the work it was affirmed that the emperor derived his imperial power from God, who had also enjoined him through the medium of Peter to tend the flock entrusted to him. The learned commentator Theodore Balsamon, writing in the twelfth century, ascribed to the emperor sacerdotal and doctrinal authority, carrying with it the duty to safeguard the souls as well as the bodies of his subjects and the right to reform the canons by law.

Even before this extreme statement, however, the system of Caesaropapism had been challenged by a number of apologists of the church, who, in a group of writings represented principally by the tenth century *Epanagoge*, had gone so far as to deny to the emperor any participation whatsoever in the formulation of doctrine. After establishing the principle that both patriarch and emperor were representatives of the one supreme and universal ruler, Jesus Christ, the *Epanagoge* attributed to the patriarch exclusive power to interpret the canons, on the basis of which he ruled the church. While the formulation and interpretation of the laws of the state rested entirely with the emperor, these laws, according to the *Epanagoge*, should not conflict with the canons. The patriarch, who should be the visible symbol of Christ, should not hesitate to defend the dogmas and the truth before the emperor. Apparently the *Epanagoge* represented merely an unofficial proposal for reform, but their prescriptions were included in all the juristic compendia from the tenth to the fifteenth centuries and had a decisive influence down to the dissolution of the Byzantine Empire. As a result of their insistence upon the subordination of the emperor to the canons a series of conflicts occurred between patriarch and emperor, such as the clash precipitated between Leo VI, the Wise, and Nicholas Mysticus, after the former had contracted his fourth marriage.

Yet, so far as matters of ecclesiastical discipline were concerned, the ultimate authority of

the emperor was never questioned in the east. By summoning and dissolving synods he wielded considerable influence on their activity; he was also empowered to issue laws regulating ecclesiastical conditions, to supervise the execution of ecclesiastical rules and to pronounce the church autocephalous. From the tenth century on he regularly filled the bishoprics and could promote the bishops to metropolitans. The patriarch of Constantinople was customarily selected by the emperor from a list of three candidates proposed by the synod of metropolitans; if he so desired, however, the emperor could reject the entire list and present his own candidate for ratification by the synod, which naturally followed his wishes. After the final consummation of the schism between east and west in 1054 under the patriarch Michael Cerularius and Pope Leo IX the emperor encountered still less resistance to his policy of intervention in the church. What opposition persisted gradually came to emanate not as formerly from the episcopate but from the monasteries and such monastic leaders as Theodore of Studium; for the monasteries were the centers of religious life.

For its financial resources the early church depended upon an annual allowance first granted by Constantine the Great. After the final abolition of the state stipend by Justinian the parish priests derived their support from voluntary gifts on the part of the laity and from periodic obligatory collections, supplemented by the fees which they collected for official services and by the income from the immovable property donated to the church. The bishops tapped the same sources of income and in addition enjoyed the yield of church taxes, levied on the laity and the parish priests alike. From the name *embatōikion* (meaning literally entrance fee; later used interchangeably with *emphyteusis*), by which the taxes imposed upon the parish priests came to be known, it is clear that the bishops of this period regarded themselves as the lessors of the parish posts. Analogous taxes were imposed upon the bishops by the metropolitans and patriarchs who installed them.

The sources of ecclesiastical law in the east are the canons of the apostles, of synods and of the tenth century church fathers. Among the canonical collections the most important is the *Nomokanon*, or, as it is called, the *Nomokanon* of Photius; while the commentaries on the *Nomokanon* by Aristinus Zonaras and Balsamon, the subsequent collections of the *Syntagma* by Matthew Blastaris and the *Hexabiblos* of Con-

stantine Armenopoulos are also essential documents in eastern canon law.

The organization of the church underwent considerable modification as a result of the fall of the Byzantine Empire in 1453 and the disappearance of the imperial office. With the subjection of the Christian population to Turkish domination the patriarch came to assume leadership over his people in the secular as well as the religious sphere. By the newly installed Turkish government he was given extensive authority over the administration of civil and criminal law and held responsible for the policing of his followers. The other patriarchates, which had likewise been overrun by the Turks, were made subordinate to the patriarch of Constantinople, who was to act as mediator between them and the Turkish authorities. The Christians were accorded full freedom of belief and worship, even to the extent of indulging on certain of their holy days in anathemas against the Moslems. The clergy were exempt from state taxes, but the normal taxes within the church itself, which flowed from the lower clergy to the higher and finally to the patriarch, were enormously increased. At this period the patriarch was elected by an ad hoc assembly of clerical and lay leaders. In making his decisions the patriarch was in many cases forced to secure the approval of a synod, which sat permanently and which had the right to depose him. During the patriarchate of Samuel I in the eighteenth century a special body, called the Gerusia and composed of four laymen and eight metropolitans, was set up for the purpose of supervising secular affairs. In the 1860's the holy synod was reorganized and the Gerusia replaced by a council consisting of four bishops and eight laymen.

In Alexandria most of the native Copts were Monophysites; in Antioch the Syrians were in the majority, and in Jerusalem the Arabs. All these patriarchates were Greek, however, in the sense that all the higher offices in the church were monopolized by Greeks. It was not until 1899 that an Arab became patriarch of Antioch. The ancient heresies, such as the Nestorian, the Monophysite and the Monolite, were perpetuated in six patriarchates, which are united with Rome: the Coptic, the Cilician (i.e. the Armenian Catholic), the Chaldean, the Melchite, the Maronite and the Syro-Jacobite. As a result of the territorial principle operating in the Eastern church the creation of new independent political units—usually nations—led to a corresponding number of autocephalous churches. In

the nineteenth century, when this tendency was at its height, there were fifteen such churches. At the present day the most important autocephalous churches in the east are the Serbian, the Greek, the Rumanian, the Orthodox church in Poland and the Russian.

V. LEONTOVICH

Russian. As early as the ninth century the Holy Scriptures had been translated by two Macedonian Slavs of Salonica and in that form had passed over into Russia. But Christianity did not become the official religion until 988, when the grand duke Vladimir of Kiev, otherwise known as "the Saint," introduced from Byzantium the doctrines and institutions prevailing in the Eastern branch of the Christian church. Under the leadership of Vladimir and his successors churches and monasteries were built, schools and libraries were founded in the chief towns and pagan idols were destroyed. In the main, however, the new faith did not spread beyond the ruling classes. The clergy, being exclusively Greek, had few points of contact with the masses of the people, who continued for the most part in their pagan ways; and, since the monks were mostly illiterate and unversed in doctrinal matters, worship seldom amounted to more than performance of the simplest rites.

In the course of time, however, particularly in the period after the fourth crusade, the patriarch in Constantinople gradually lost control over the Russian church and more and more of the clergy came to be recruited from the native population. Beginning with the fourteenth century Christianity began to take firmer root among the masses, and with the decline of learning among the clergy the gap between priesthood and congregation became rapidly less pronounced. As a result of this transformation there emerged the ideal of a Holy Russia, and from the fifteenth to the seventeenth century a wave of Christian enthusiasm manifested itself in the eager performance of ritual, the building of churches, the ringing of bells, the worship of saints and, among the upper classes, prolonged fasts. Although the masses of the people still remained ignorant of even the most elementary forms of prayer and sacrament, the church served as a humanizing influence, particularly in the sphere of personal relationships, such as those between husband and wife, father and children, master and slave. Byzantine canon exerted a marked influence on the development of Russian law. Moreover the existence of a common faith and cult was a major

factor in welding together the scattered population and in breaking down the regional divisions which were so characteristic of the period prior to the sixteenth century. The new ideal of a unified Russia was symbolized in the person of the metropolitan, who was located first at Kiev and then successively at Vladimir and Moscow.

The work of actual unification, however, was carried out by the grand dukes of Moscow. Assuming the Byzantine title of czar the new "autocrat of all the Russias" claimed recognition from the church as the supreme head of Russian Christianity. Before such claims could be established the relationship between church and state had to become far more intimate. The opportunity came with the fall of Constantinople in 1453. Shortly after that event a delegation of Bulgarian and Serbian clergy, seeking assistance in their efforts to throw off Turkish domination, exhorted the czar to assume the role of universal leader of the Orthodox church, which, according to them, the Byzantine *basileus* had surrendered by his action of 1439 in acceding to the Catholic schism. The theory of the universal leadership of the Russian church was given concrete form a century later by the creation (1589) of a new patriarch, specially assigned to the nationalized church of Russia. Moscow was hailed as a "Third Rome," destined to carry on the work abandoned by its two corrupted predecessors. In return for its acquiescence in these new claims of the Russian czar the church was guaranteed the inviolability of its goods and estates.

Since the Byzantine church was now looked down upon as tainted with heresy, those elements, however insignificant, in the Russian ritual which deviated from the Greek were deliberately emphasized as proof of the greater antiquity and purity of the Russian religion. But although an independent national church had been created, religious worship in Russia still remained at a rather low level. Even as late as the seventeenth century most of the candidates for the priesthood were not only illiterate but barely able to recite the services which they had memorized, while the masses of the people had no acquaintance whatsoever with religious books.

In the seventeenth century a profound schism took place in the Russian church. In spite of strenuous efforts to keep out heretical influences from the west Protestant Biblical criticism gradually filtered into Russia. As a result it became apparent to the more educated leaders that the Russian Bible and prayer books were filled with glaring deviations from the Greek originals. Not

withstanding the insistence of the patriarch of Constantinople that these deviations did not affect the essentials of the faith, the Russian patriarch Nikon and the czar Alexis Mikhailovich forced through a rather drastic revision, which was officially approved by the Councils of Moscow summoned by the czar in 1666 and 1667. These councils were attended by the patriarchs of Alexandria and Antioch, who acknowledged the leadership of Moscow. The "old believers" who out of a feeling of nationalistic pride refused to abandon the traditional texts were proclaimed schismatics and severely persecuted by the government. Since the masses aligned themselves with the "old believers," the official clergy lost all contact with the people and their erudite theological treatises written in Latin exerted little real influence. With the reforms of Peter the Great the cleavage between the educated upper classes and the masses became complete. Since the official church had lost its vitality, the czar's work of Europeanization encountered but little opposition. His first and perhaps most important reform was the abolition of the office of patriarch, on the ground that a strong patriarch, like Nikon, for example, who championed the superiority of the spiritual power over the temporal, constituted a threat to the state and a dangerous rival to the emperor for the allegiance of the people. In the place of the patriarch the czar substituted a Protestant type of collegiate body, called the Holy Synod, and placed it under the supervision of a secular official, known as procurator general, who was chosen from the military caste; this secular supervisor was gradually transformed into a minister of cult. The subordination of the church to the state was facilitated by the fact that since the decisions of the Seven Œcumenical Councils were accepted as a rigid and unchangeable body of dogma little need was felt for a legislative organ. In the Eastern Orthodox churches generally the administration of the ecclesiastical system by the national state has come to be accepted as the most convenient arrangement.

Peter's reforms did not succeed, however, in restoring the inner vitality of the Russian church. The parish gradually abandoned the practise of choosing its priest and with a feeling of relief considered itself freed from the obligation of supporting him. In general the parishioners did not look upon the priest as an authority on doctrine or as a guide in matters of Christian conduct; their only concern was "that the churches should not remain without singing and

the deceased without burial." Hence priests were selected from the lower classes and enjoyed no social standing. Eventually the priesthood developed into a caste, the office being transmitted from father to son or to son-in-law. Deeper religious feelings were preserved only among the "old believers" or among the new types of evangelical, mystical or rationalistic sects (*q.v.*) which in the face of severe official persecution began to spring up around the end of the seventeenth century. The widening breach between the educated classes and the church was reflected in the rapid spread of secularism and rationalism. In the period after 1700 attempts at reinterpretation and refinement of dogma were limited to secular philosophers like Khomyakov, Vladimir Solovev and Berdyaev. Under the influence of romantic currents from western Europe during the years from 1830 to 1850 the Slavophiles initiated an intellectual and religious revival, and in the period of political reaction at the end of the nineteenth century there was a similar spiritual ferment, which extended also to the more educated clergy.

In the revolution of 1905 and again in 1917 attempts were made to reestablish the office of patriarch as a symbol of the independence of the church. In August, 1917, a council was summoned and in November a patriarch was elected. But the Bolsheviks were already in power. Although their constitution provided for the separation of church and state and freedom of religious teaching, their distrust of religion as the "opiate of the people" led them immediately to launch a campaign of extermination. When the council and the patriarch urged the faithful to resist to the utmost, Tikhon was arrested and severe limitations were imposed on freedom of worship. Tikhon's opponents within the church were protected by the government and were permitted to summon a council. This council deposed Tikhon, pronounced capitalism a "deadly sin," recommended communism as a realization of Biblical teaching and declared that it was the duty of every Christian to obey the Bolsheviks. Eventually a compromise was reached with Tikhon, who after declaring himself loyal to the government was released from prison and inaugurated a persecution of the Old Church. Exile and imprisonment were frequently resorted to. Subsequently permission was given to organize a temporary Holy Synod, but the Communists through their representative Tuckhov exercised strict control over nominations of bishops and priests. Once again the church was

made completely dependent upon the state.

In carrying through their program of exterminating all religion the Communist leaders urged the people to demand the destruction of churches and the burning of icons. Most of the churches were converted into museums, clubs, motion picture houses and the like. The performance of religious ceremonies was made increasingly difficult and the very existence of the clergy became precarious. Atheism was officially taught in the schools. Millions of children and adolescents were organized into a Union of Atheists, and any kind of celebration of religious feasts was rigorously discouraged. Propaganda of this type has been on the whole successful, although in secret many of the people cling to their religion. Gradually official persecution has been extended to Catholics, Protestants, Jews, Moslems and to Russian sectarians who proved more steadfast in their belief. The pact with Germany and the United States have tended to restore religious liberty to the nationals of these two countries in the Soviet Union.

PAUL MILIUKOV

PROTESTANT. The religious institutions of Protestantism (*q.v.*) are less readily identifiable with the churches than is the case in Roman or Greek Catholicism. Protestant religion centers less in the ecclesiastical establishment than in the Bible and the proclamation of its message and in the personal religious experiences and attitudes of its adherents. In addition to Bible and preaching ministry the religious institutions of Protestantism include rites, or sacraments, especially baptism and the Lord's Supper, the observance of Sunday as the Sabbath, the customary meeting for worship or instruction, the ministry, the discipline, the propaganda, the modes of worship, educational establishments, creeds and confessions of faith and the established relations of the religious institutions to the political, economic and educational forms of social life. The organization of these diverse religious customs into synthetic wholes is itself institutional and forms the pattern of the churches as the religious institutions proper. There is no one pattern of organization that is common to all the Protestant churches, but there are characteristic features which distinguish them and the institutions of which they are composed from other forms of Christianity.

A primary feature of the religious institutions of Protestantism is their comparative simplicity, both taken singly and in their syntheses. This

simplicity is apparent first of all in the small number of rites which are accepted and practised. Of the seven sacraments observed in Roman Catholicism, Protestantism acknowledges and observes only two, baptism and the Lord's Supper, although occasionally other ancient rites are perpetuated in modified form. The organization of the clergy is equally simple, since in general, aside from a few vestiges of gradation remaining in some of the churches, only one grade of orders is recognized. The number of holy and festival days observed in older forms of Christianity has been greatly reduced and the Sabbath, or Lord's Day, has been singled out as the one significant religious institution in the calendar. The simplicity characterizing Protestant churches may be explained as a reaction against the overdeveloped institutionalism of the mediaeval church, as an expression of the customs and tastes of those middle classes which were attracted to and supported the Reformation movements and, finally, as a reflection of the fact that many spheres of social life were excluded from ecclesiastical sanction and control. Among the Baptists, Quakers and the other branches of Protestantism which represented the religious interests of the lower classes in the economic scale this simplicity has been carried to even greater lengths.

A second feature which, except for the Anglican establishment and a few sects, is typical of Protestant institutionalism is the predominant role played by the Scriptures. In his early days Luther was interested not only in substituting the Bible for the hierarchy and the pope but in replacing the entire ecclesiastical establishment by the simple preaching of the "Word of God." In other quarters of Protestantism the doctrine of the invisible church represented a similar desire for a wholly spiritual society, whose members, unknown to one another, owned a common allegiance only to Christ and His revelation. Although the necessity of formulating and enforcing a common interpretation of the Scriptures led inevitably to the creation of other institutions, the dominant position of the Bible as the Word of God or as the vehicle of the Word continued to be recognized by almost all sections of Protestantism. In this respect the Protestant movement reflected an actual social change which had taken place during the later Middle Ages when, in many sections of Europe and among many social groups, reliance upon the Bible had replaced dependence upon the church and its officers. This far reaching trans-

formation may be attributed to a variety of factors: theological developments, as in nominalism; certain sectarian movements, as represented by the Waldenses and Lollards; the wider distribution of the text made possible by the development of printing; and the revival of Greek and Hebrew studies. The substitution of the Scriptural sermon for the Mass, the reinterpretation of the sacraments in conformity with the doctrine of the Scriptures, the organization of the churches along supposedly New Testament lines and in general the effort to make all religious practises and beliefs contribute to the end of teaching the Bible gave to the Protestant churches much of their peculiar character.

Another characteristic of Protestant institutions as distinguished from Roman Catholic is their greater subordination to the reason, conscience or desire of the individual. The spiritualist, rationalist and revolutionary sects representing the extreme left of the Protestant movement developed a contract theory of religious institutions and tended to make individual inspiration or conviction the basis of religious life. And although Anglicanism, Lutheranism and Calvinism continued to regard both religious and secular institutions as possessing superindividual and non-utilitarian character, they were forced, in so far as they placed the Bible in the position of ultimate authority, to make some concessions to the right of individual interpretation and to allow considerable freedom in spheres where Biblical authority was not available. Furthermore the importance of the subjective element in all religious processes was recognized. Institutions were regarded as deriving their effectiveness not solely from their own inherent power but in some degree from the attitudes of the individual participants. The Word must be heard in faith; sacraments are dependent for their efficacy upon the individual's state of mind; when the authority of the Bible gives no clear direction the forms of church government and non-sacramental rites are subject to the common reason. It was natural that at this point marked divergences should enter into Protestantism, according as the compromise between the institutional and authoritarian principle on the one hand and the individual principle on the other inclined more to the side of objective authority or to the side of subjective interpretation. The differences became especially apparent in the theory and observation of the sacraments. Lutheranism took the most conservative position; the Anabaptists

and Quakers were highly individualistic; while Calvinism occupied an intermediate place.

The multiplicity of institutional systems is another striking characteristic of the Protestant churches. This tendency toward pluralism is attributable in part to the individualism noted above but even more to the national, cultural and racial sources of the Protestant movement. In the course of the movement religious institutions which developed in more or less isolated societies under the general influence of the Scriptures were often successful in gaining recognition. The question at issue for the Protestant churches has never been whether universal uniformity should be established throughout the Christian world but only whether uniformity should be established within a nation. The religious institutions of Protestantism are often, in this sense at least, national as well as Biblical; in many cases, however, they are merely local and do not become national or international until a homogeneous culture is evolved.

The pluralism of Protestantism is evident in its creeds. Although the Apostles' Creed is widely accepted as a ritual form and although the Nicene and Athanasian creeds are received by the Lutheran and Anglican churches, there is no common Protestant creed; instead there are numerous confessions of faith representing the convictions or the doctrines prevailing in certain regions at certain periods. In polity as well as in belief diversity is the rule. Since the primary authority of most forms of Protestantism, the Bible, offers no developed system of church organization, the tendency has been to recognize both local custom and reason in the construction of church governments, either with clear recognition of the silence of the Scriptures or with the attempt to deduce the desired system from the acknowledged authority. Thus Protestant institutions may be regarded as the products of the principle of individuality—whether personal, cultural or national—in interaction with the principle of Biblical authority. The resulting diversity is illustrated by reference to some of the main types of Protestant institutional systems which have emerged since the Reformation.

In so far as it was a negative reaction against mediaeval religious institutions Lutheranism began by eliminating the Mass, the observance of numerous holy days, monastic institutions, the celibacy of the clergy, the hierarchy and many minor customs. On the positive side it exalted the authority of the Scriptures, not as a book of

laws but as the revelation necessary for the spiritual salvation of man. It retained the traditional Catholic creeds and beliefs but subordinated these along with the two sacraments to the doctrine of the Word of God. Its conception of the church was primarily that of a congregation in which the Word was preached and the sacraments observed. It tended to replace the clergy by teachers or preachers who were empowered to administer the sacraments but were not set apart from other men save as they exercised their special function.

Yet this essentially non-institutional tendency eventuated, under the impact of various needs and influences, in the development of a number of institutions. The confession of faith which was designed merely to serve the Lutheran cause at the Diet of Augsburg became the authoritative creed of later generations, as did to a lesser extent those of Luther's catechisms which were written to instruct the people of his generation in the Christian faith. As a result of conflicts with spiritualist and revolutionary groups—which in addition to sharing Luther's hostility to Roman Catholic institutions were also antagonistic to the civil powers and sought to organize religious life on the basis of personal inspirations—Lutheranism tended more and more to emphasize the objective, non-personal elements in the Christian life, particularly the Bible and the sacraments. The fact that the revolt led not to the reformation of the Roman church but to the separation of the churches in many parts of Germany from Catholicism made the regulation of church affairs imperative and therefore forwarded the establishment of creeds, the recognition of certain forms of worship and the organization of the preachers.

But of greatest importance for the formation of Lutheran institutions was the part played by the civil power in the reform. Lutheranism had no interest in the divorce of the church from the political state. Sharing the Catholic conception of religion as an inclusive and uniform affair, it did not seek to establish the church as an independent society. Moreover it drew heavily upon the widespread desire for home rule in political as well as in religious matters and received its most important support from the princes. Under these circumstances the ambition of the princes and the antagonism of lower clergy and laity to hierarchical control led naturally to the development of the state church with the prince as its recognized head. In theory there was a distinction between the external and

internal government of the church, the former being entrusted to the civil power, the latter being subject to the Word of God. In fact the political power not only regulated the organization of the church but also came to decide, in accordance with the principle *cujus regio, ejus religio*, upon the creed of the state church.

In several respects, however, the autocratic principle was modified as a result of Luther's interest in a wholly spiritual conception of the church and of his insistence on the primacy of the Word of God. For example, where the episcopacy was maintained it functioned only as a superintendency, while the preaching ministry was exalted and given considerable freedom in the exercise of its "spiritual" function. Efforts on the part of the state to infringe upon the latter function have frequently provoked, as in 1817 and in 1933, determined resistance from the Lutheran church. Because of its political principles Lutheranism has been divided into many provincial churches in central Europe and Scandinavia. Despite modifications of the state church principle which were introduced after the German revolution of 1918 and the attempted separation of political and ecclesiastical institutions, the church continued dependent on the state for financial support, for the education of its ministry in state-controlled universities and in part for the general administration of its affairs. The nationalist reorganization of the German government in 1933 nullified to a large extent the tentative movements toward separation of the two institutional systems and subjected the church to a larger measure of civil control than prevailed even before the revolution of 1918. The migration of German and Scandinavian Lutherans to America has led to the development of independent Lutheran churches with voluntary membership but with otherwise characteristically Lutheran attitudes of submission to the civil power and allegiance to the Word of God interpreted through the Lutheran creeds. These two principles form the poles of the Lutheran institutional system.

In comparison with the Lutheran church the Church of England is far more similar in its structure to the Roman Catholic. The process of institutional simplification was not carried to the same lengths as in Germany. The English Protestant movement was first of all political and economic. The substitution of the English king for the Roman pope as the supreme head of the church and the confiscation of ecclesiastical endowments led to the nationalization of the insti-

tution, while the ceremonies, the hierarchy and the creeds remained essentially unchanged. In the course of time, however, reform influences from the continent, combining with English movements and the anticlericalism of the emergent middle class radicals who constituted the backbone of the Puritan movement, brought about various modifications of the mediaeval system. The Catholic creeds were supplemented by a mildly Protestant creed, the Thirty-nine Articles; the sacraments were reduced to two; the vernacular was adopted in the services of the church; and the marriage of priests was permitted. But the principle of the institutional church was maintained and the Scriptures remained subordinate to the church; episcopacy and apostolic succession also continued to be recognized. The organization of the church remained monarchical even after the storms of the seventeenth century, and with the development of religious toleration the dependence of the church upon the state instead of being diminished was increased. The substitution of Parliament for the king as the actual head of the church meant in theory self-determination for the church, in view of the identification of church and state. But the secularization of the state and the admission of non-Anglicans to Parliament and cabinet left the church dependent upon a rulership which it could elect only in part. Furthermore in structure the church remained monarchical, the initiative in government coming in theory not from members of the church -which is not a society- but from the supreme head, the king or the king in Parliament. In 1919 an enabling act was passed to deal with the anomalous situation. It provided for a national assembly entrusted with ecclesiastical legislation but reserving to Parliament ultimate control of church affairs; the prayer book controversy of 1927 and 1928 indicated that this control remained effective. The migration of Anglicans to countries in which church and state are separated has led, as with the Lutherans, to the adoption of new principles of organization. Although the episcopacy is maintained, the church is constituted as a society whose officers are elected by the members. The other institutions of the Church of England remain their effectiveness under the new conditions which have arisen.

As in the case of Lutheranism the Calvinistic (or Reformed) churches are built primarily upon the Scriptures and the preaching ministry. But there are significant differences between the two

types of organization, and both Scriptures and ministry function differently in Calvinism than in Lutheranism. The presbyterian organization of the church may be traced to the persisting influence of the conciliar tradition (*see* CONCILIAR MOVEMENT), to the character of political organization prevailing in the free cities in which Calvinism arose, to a widespread interest in jurisprudence and to Calvin's own legal training and administrative genius. The presbyterian type of Protestant religious institution is characterized by its constitutionalism and parliamentarism. It looks upon the Scriptures not so much as the Word of God regarding salvation but rather as the revelation of the will of God and therefore as the fundamental constitution of both ecclesiastical and civil government. This constitution is formed not only by the Bible but by the will of God revealed to human reason as natural law; whichever approach is made the will of God is no unknown quantity.

Church and state are therefore set alongside each other as equal powers with different functions, and their cooperation is insured by their common allegiance to the same constitution. While Presbyterianism maintains the doctrine of obedience to civil power, it qualifies that obedience by appeal to the superior constitutional principle and has frequently brought pressure to bear upon the state to acknowledge and put into effect the clergy's interpretation of this constitution. If mediaeval Catholicism tended to subordinate the state to the church and Lutheranism and Anglicanism subordinated the church to the state, Calvinism was enabled by reason of its attitude toward the Scriptures and the will of God to seek a correlation of the two powers. In fact, however, the theocratic conception led to various efforts on the part of the clergy, notably in Geneva and in New England, to control civic affairs. In Geneva the municipal council, initiating the work of reformation, displaced the bishop and undertook to appoint pastors and reform the rites. After various conflicts the moral and religious guidance of the city was entrusted to a church organization headed by a congregation, consisting of all the clergy, and a consistory, appointed by the congregation and the civil council. Thus was recognized the parity of church and state, or of clergy and municipal councilors. The ascendancy of the clergy and their interest in moral guidance and discipline brought about the development of a church-state. This pattern greatly influenced the attempts to establish Calvinist

Protestantism in Scotland, England and New England. While theocracies of the Genevan type have been short lived, the view of the will of God as the common constitution of church and state and of the Bible as the revelation of the will of God has continued to make Presbyterian or Reformed churches more independent in their relations to the state than Lutheranism and Anglicanism have been.

The church itself under this constitution was regarded not only as a place or group in which the Word of God was preached but also as a society governed by the will of God. Hence under Calvinism the church became not only an institution of worship and of the preaching of the gospel of salvation but an agency of moral instruction and control, while the ministry exercised not only a teaching and preaching but also a ruling function. Discipline no less than doctrine became a primary consideration. In conformity with the theocratic idea the ministry was regarded as deriving its rights and powers not from the citizens or church members but from the declared will of God. The central agency of Calvinist churches was the teaching and ruling ministry or eldership. In accordance with the anti-hierarchical doctrine of the equality of all presbyters and with the constitutional idea, these churches were organized on conciliar lines with delegated synods or general assemblies as the highest governing agencies. Because of the close relation of Presbyterian churches to the states no general assembly of all Presbyterian churches has been possible; yet they are not so greatly limited by the civil powers as is the case with Lutheran and Anglican churches. The constitutional theory of the church, combined with the interests of that burgher class which furnished the bulk of its adherents, impelled the Calvinist reformers to deal more radically with the institutions of the mediaeval church than was the case in the other great Protestant movements. The elimination of holy days, special vows, ornate ceremonies, episcopacy and hierarchy was carried on with unusual vigor. Similarly on the positive side the observance of the Sabbath, moral and religious instruction and church attendance were established by an equally rigorous insistence on the part of the clergy.

Still another type of institutional system was represented in the sixteenth and seventeenth centuries by such minor protestant groups as the Anabaptists, the Quakers and the Independents. This type of Protestant church is regarded

as a society rather than as a public corporation, and all religious institutions are interpreted as being contractual in origin and essence. Neither the state nor the Bible but the religious society organized by its members is the primary religious institution, while the ultimate source of authority is the individual religious experience. The activity of God is thought of as direct and spiritual rather than as confined to the Scriptures or to the clergy or to the state. Emphasis is placed upon the qualifications for membership in the society, which may be interpreted more in moral or more in religious terms. The task of the society lies in the instruction, edification and discipline of its members and in the gaining of new converts. It rejects all institutional rites and creeds as such. In so far as old ritual customs are maintained they are reinterpreted as initiations into the group or as reaffirmations of loyalty, although some of the older institutional overtones doubtless remain, particularly where such groups are surrounded by other types of Protestantism and by Catholicism. Creeds are statements of conviction on the part of the society and may therefore be readily amended.

Each local society is a self-governing unit choosing its own officers, including the clergy, who are simply leaders appointed by the group by reason of their superior qualifications. The central institutions of the society are the meeting for mutual instruction and edification, the rite of reception of new members—frequently by baptism—and the rite of fellowship in the Lord's Supper. In its relation to the state such a society conceived itself in extreme cases as an alternative to the political unit, which likewise was regarded as contractual in nature. The society, assuming responsibility for disciplining its members without appeal to the police powers of the state and for settling intramural disputes in its own courts, forbade recourse to state courts as well as participation in the military, judicial or administrative functions of the state. In such radical societies there has also been manifest a tendency toward an independent economic organization, which sometimes has taken a communistic form. These extreme features appeared not only among the sixteenth and the seventeenth century revolutionary groups but also, with modifications, among eighteenth century Moravians and nineteenth century Mormons. In general the influences which have played upon this type of Protestantism have been the economic and cultural character of its adherents,

usually proletarian, the appeal of the New Testament ideal of the church and the revolutionary hope of the establishment of the Kingdom of God.

While the extreme forms of voluntary, lay Protestantism have had a short history, their general pattern of organization has exerted a more enduring influence, as, for example, in Methodism and in those branches of the Lutheran, Anglican and Presbyterian churches which operate in countries where there is a separation of church and state. Even such groups as the Anabaptists and the Independents after abandoning their more radical principles have been perpetuated in modified form as effective churches (Baptist and Congregational). In these cases the practical interest of the religious society in politics has been directed toward the elimination of state control of religious functions and, by necessary implication, toward the guaranty of general tolerance in religion. The broader interest of the members in political or economic affairs has led to the formation of additional associations, more or less loosely connected with the church, such as societies for the abolition of slavery, for temperance, for prison reform or for the promotion of education. The religious society as such tended to concentrate upon the narrower functions of religious and moral instruction, worship and the stimulation of religious experience. With the rise of new generations which were not parties to the original contract constituting the church, these societies have necessarily taken on more of an institutional character. Conversion was established as a custom, confessions of faith became creeds for testing the qualifications of applicants for membership and the lay leadership assumed a professional character. Yet the basic pattern of the voluntary association persists.

The highest development of Protestant religious societies has taken place in the United States, where it was furthered by the modification which the presbyterian Protestantism of the early Puritans underwent as a result of the influence of sectarians and the conditions of settlement in small towns. Other contributing factors in this process of modification were the influx of Baptist and Quaker elements, the separation of church and state and particularly the necessity of developing religious organizations on new frontiers. The society form of organization was best adapted to these conditions. Intermediate forms between the institutional church and the voluntary association have arisen in con-

sequence of the later development of societies and the readjustment of the churches. The most important of these intermediate forms are Congregationalism, which is a product of Presbyterianism and the societal form, and Methodism, in which episcopatism united with the voluntary principle. In European countries as well as in the United States the transformation of churches into religious societies has proceeded and is being accelerated at the present time. While the Pietist movement with its interest in religious experience, and idealistic theology with its emphasis on religion as a concern of the inner life, have played their part in this trend, the separation of church and state, whether on the initiative of the church or the state, has been an even more important factor.

Because of the growing discreteness of Protestantism as a result of the spread of the voluntary societies, and in view of the increasing intercourse between national groups in the modern world, repeated efforts have been made, particularly in the twentieth century, to organize the denominations into effective unions. The Federal Council of the Churches of Christ in America (uniting twenty-five groups with 21,700,000 members), the National Council of Evangelical Free Churches in England and, prior to 1933, the German Evangelical Church Federation represent relatively loose organizations. The tendency toward organic unification of churches across national boundaries has been markedly on the increase since the World War. International conferences of Presbyterians, Lutherans and many of the other Protestant churches have been held in recent years, but no effective international organization has been achieved. In special areas or tasks, particularly in the foreign mission enterprise, which it has promoted with great energy, Protestantism has been able to gain some measure of unity, partly no doubt as a result of economic pressure. A further result of the growth of the societal principle in Protestantism has been the multiplication of national and international societies, which although not organically connected with the churches are loosely associated with them, for the promotion of political and social ends. Young Men's and Young Women's Christian associations, the International Missionary Council, the World Alliance for International Friendship through the Churches, are representative of a large number of such agencies.

RELIGIOUS ORDERS. As closely integrated associations of likeminded individuals religious orders represent a manifestation of the collectivistic tendency inherent in all religions. Their premises are derived ultimately from the most primitive conception of religion: the view that the supernatural is essentially a force in either an active or a passive sense and that once an individual is possessed by this force, he becomes its appointed instrument. Because of the contagious quality of this force its full potency can be realized and communicated only through association. To the member of the order the force seems to emanate from a sphere entirely distinct from the profane realm of civil society. Hence most religious orders and all forms of monasticism rest on a dualistic world view and are characterized by more or less rigorous ascetic tendencies. At any rate they aim to withdraw into a world apart, where their members may enjoy the greatest possible degree of freedom from earthly interests and pursue a life of renunciation and sacrifice.

With respect to internal organization a typical feature of the religious order is the rigid standardization of all activity, in some cases so thoroughgoing as to require from the individual complete self-abnegation. This is perhaps the essential distinction between the priesthood and the religious order, for the priest, being the chosen mediator between God and man, is a charismatic personality and, by the premises of his office, remains conscious of his individual role and functions. The way of life to which the member of the order subjects himself is patterned upon a particular religious ideal, finding its prototype perhaps in the life of the founder of the religion: thus the Franciscans sought to imitate the poverty of Christ. But in addition to

being bound by an abstract rule the member must usually surrender himself also to the personal authority of the order's directors.

The type of association represented by the religious order is deeply embedded in the essence of religion. The dim outlines of its structural features may be discerned even in primitive secret societies. Although the initial function of these societies is frequently obscured, particularly among Melanesian and African peoples, in the subsequent course of their development, they often originate as associations of the guardians of certain magical or religious rites. The more advanced civilizations of ancient Mexico and Peru developed religious orders similar to the familiar Christian type. In Mexico and particularly among the adherents of the cult of Quetzalcoatl there were cloisters for both men and women, and even children were enrolled in them either temporarily or for life. Those who had been admitted were distinguished by a special mode of dress and observed an ascetic diet. Their services consisted in nocturnal vigils, the singing of sacred hymns, penitential exercises, the upkeep of the temple and exacting toil. In Peru the members of the Order of the Virgins of the Sun were also immured in cloisters, where they guarded the sacred flame in addition to weaving and embroidering for the temple and the Incas. Like the Roman vestal virgins, they were buried alive when they violated the vow of chastity.

Because of the Hindu propensity for the contemplative life India has offered a particularly propitious environment for the development of religious orders. Both Jainism and Buddhism are in reality nothing but huge religious orders, preserving in however modified form the vestiges of age old usages and ideas. In the passage in which the *Rigveda* (x: 136) refers to the long haired zealots who "wear the yellow dirty (vestments of bark)" and "follow the course of the wind when they have assumed the power of gods," Oldenberg long ago detected a reference to a self-contained association possessing carefully guarded secrets. A prominent place in both religious organizations is accorded to the lay brethren, although the relationship of the latter to the monks is less intimate in the case of Buddhism than in Jainism. The lay brethren are expected to provide for the material necessities of the monks, but they themselves assume only a part of the obligations of the monastic way of life and therefore attain correspondingly limited religious rewards. The Christian

Premonstratensian and mendicant orders similarly adapted their rigorous ideals to the needs of daily life by constructing Third Orders of laymen, which complemented the first orders of regular monks and the second orders of nuns. Each of these lay associations was subject to the authority of the order concerned; and its members, while remaining in the world, obeyed a rule, based on an ideal of relative perfection.

The Hebraic *nebiim* mentioned in the Old Testament were fundamentally similar to the Hindu zealots; this group, which certain modern scholars have described as an order of the faithful devotees of Yahweh, consisted of fanatics organized into rigidly exclusive societies with their own leaders and settlements; they were subject to a definite code of rules and participated in the political as well as the religious life of the people. The Rechabites and the Nazarites, other associations of ancient Israel which fall under the category of religious orders, were in accord in their condemnation of the civilizing process which Judaism had undergone in the land of Canaan. Reacting against the corruption which they attributed to this cultural advance, they sought to realize the original nomadic ideal of primitive Judaism by abandoning the domestic life and the pursuit of agriculture and viticulture. In the more advanced religious culture of Palestinian Judaism the outstanding secret order was that of the Essenes, who practised agriculture and the handicrafts but proscribed trade. Although organized according to the hierarchical principle, they lived a communal monastic life and satisfied their material needs by a collectivistic mode of production and distribution. The observance of sacred fasts and the pursuit of purity through frequent bathing were typical of the Essenes. Their orientation, however, was not strictly Hebraic, since in keeping with the syncretistic tendencies of the time they incorporated foreign elements into their doctrine.

While the Koran attributed to Mohammed the saying that "there is no monasticism in Islam, the monasticism of this community is the religious war," the religious order was nevertheless to play a great role in the history of Islam. The existence in 1929 of 275,800 members of religious orders in Algiers out of a total Moslem population of 5,174,000 testifies to the often underestimated capacity of Islam— as well as of other religions—to adapt itself to changing circumstances. Partly through the development of intrinsic elements in the Islamic religion, partly

under the influence of neo-Platonism, Christianity and Hinduism, there emerged those intense mystics whose classic centers were the monasteries of the Persian Sufis (so-called because of their woolen vestments). The Kādirīya, the oldest of these orders, was founded in 1166 by 'Abd al-Kādir al-Djilānī and from its center at Bagdad spread as far as China and Morocco. Subsequently numerous other orders came into existence, including the Rifā'īya ("the howling dervishes"), the Badawīya, the Shādhiliya, the 'Isawīya, the Bektāshīya and the Sanūsiya.

The Islamic orders characteristically require unconditional obedience to the head of the order. The latter claims to have derived his authority through an unbroken tradition going back through Ali and Mohammed to Gabriel and finally to Allah, but actually the rule or way of life (*tarika*) which he imposes is determined by his personal outlook and predilections. For this reason the attitudes of the Islamic orders toward the Islamic law, politics and other questions reveal a considerable degree of diversity. In general, however, the central practise of the orders is the *dhikr*, or the repetition of the sacred formula in chorus and to the accompaniment of rhythmic bodily movements until a state of hypnotic ecstasy is attained. The observance of such customs establishes the continuity between the early Hebraic *nebiim* and, for instance, the dancing dervishes. But while certain Islamic orders place exaggerated emphasis on a fantastic occultism not easily distinguishable from pure charlatanism, others are explicitly missionary and philanthropic in tendency and by such pursuits enhance the popularity which accrues to them through the supposed miraculous powers of their individual members. Usually membership in an order does not preclude activity in civil society for the purpose of supplying the material needs of the order, although genuine mendicant orders also exist.

The Catholic church, on the basis of the nature of the vows required, draws a distinction between strict religious orders, congregations and societies. In the case of the first, vows are public and solemn: public and simple in the congregations and non-public in the societies. The official categories run parallel to the varying degrees of asceticism; thus the solemn vows require the complete renunciation of property, sometimes merely on the part of the individual members, at other times, as in the case of the mendicant orders, on the part of the order as

well as of its members. The line of differentiation between the monastic type and such non-monastic associations as the canons regular and the Third Orders depends also upon the lengths to which asceticism is carried. But even the monastic orders are far from uniform in structure, and the history of religious orders is characterized by oscillation between the rigorous pursuit of extreme asceticism and a more easily attainable way of life. Some orders, such as those under the Benedictine Rule, have stressed silent contemplation and piety and, while allowing their members to perform manual labor for the maintenance of the order, have enjoined strict stability and permanent seclusion within the cloister. The isolated pursuit of self-perfection is, however, only one aspect of the activities of Christian religious orders. As preachers, confessors, teachers, sponsors of the poor, nurses of the sick, foreign missionaries, scientists, public servants and even commercial entrepreneurs members of the Christian religious orders have played and continue to play a role of decisive social significance.

Some of these functions, particularly education, the copying of manuscripts, the dispensation of charity, missionary work, the maintenance of a refuge for travelers and in the case of the Cistercians the development of trade, were performed more or less incidentally by the monasteries subject to the Benedictine Rule. But, if the military and hospitaler orders be left out of account, it was not until the thirteenth century when the new orders of friars reacted against the Benedictine ideal, which had previously dominated western monasticism, that active service in lay society became a paramount objective of the religious life. The Dominicans and Franciscans, the Augustinians and Carmelites together with other minor mendicant orders paved the way for the clerks regular, notably represented by the Society of Jesus, which without abandoning ascetic practises definitely adapted its way of life to the purpose of enabling its members to make a militant assault upon the enemies of the church in every sphere of secular life. An outgrowth and at the same time one of the most successful agents of the Counter-Reformation, the Jesuit order produced preachers, confessors to princes, royal councilors, educators, writers on political theory, historians, natural scientists, missionaries and organizers of economic enterprise. The resurgence of religious vitality accompanying the Counter-Reformation was reflected, however, not only in

an increased stress upon propagandistic activity in the lay world but in the accentuation of personal piety or of asceticism. This latter tendency was the dominant note in the reforms within many of the older orders, such as the Carmelites, the Cistercians and the Franciscans, as well as in some of the totally new associations, such as the Congregation of the Oratory and the Theatine Hermiteesses. Since the Counter-Reformation the subordination of Catholic religious orders to papal control—a relationship foreshadowed in the military orders and promoted successively by the friars and Jesuits—has been far more marked than before. Similarly the fortunes of the orders have in general, although not uniformly, paralleled those of the church. Rationalism, revolution and anticlericalism have led to suppressions of the orders and confiscations of their properties, as they have to warfare against the church as a whole. But at the present time throughout most of Europe and America the Catholic orders are free to pursue the various ideals by which they were originally inspired.

RENAISSANCE. No historical epoch has been so difficult to characterize or has given rise to such extensive controversy as the Renaissance. Vasari in the sixteenth century referred to a *renascita* of art, but it was not until the nineteenth century, especially in the writings of Stendhal and Michelet, that the period between the thirteenth and seventeenth centuries came

to be regarded widely as a distinct cultural epoch. Burckhardt must be credited primarily with the spread of the idea of the Renaissance as an age of liberation from the shackles of mediaevalism and as the beginning of the modern era of individualism. As a reaction to the views of Michelet and Burckhardt came the works of such writers as Émile Gebhart, Henry Thode, Paul Sabatier and Louis Courajod, who tended to demolish the lines of demarcation between the Renaissance and the Middle Ages and who brought out the lyric, subjective and individualistic tendencies in the late Middle Ages. Some writers, notably Carl Neumann, turned to a study of the Byzantine roots of Renaissance art. In the light of these conflicting opinions it is best to characterize the period of the Renaissance not as a wholly distinct cultural epoch, but rather as a transition period between the mediaeval and modern ages in which old and new, religious and profane, authoritarian and individualistic principles and concepts existed side by side, while at the same time certain marked transformations and changes in ideas and ways of living took place in Italy, the Netherlands, Spain, France, Germany and England. Politically the Renaissance saw the rise of the modern national state; in the economic sphere it witnessed the development of early capitalism and the emergence of a new leisure class. These political and economic changes were a part of the general transformation and at the same time served to inaugurate and intensify certain other aspects of the general cultural and intellectual change. The transformations during the Renaissance did not find expression in definite theories or firmly established values. They manifested themselves much more as shifts of emphasis, on the basis of which certain evaluations and concepts were found insufficient to interpret the changes brought about in social and individual life, whereas others acquired an independent significance. This was characteristic above all of thirteenth century Italy. For the problem here was not one of new systems or even of a conscious negation of mediaeval Christian values. The fact was that the traditional mediaeval ideas no longer gave satisfactory meaning to life. Men now attempted to represent and understand their existence without recourse to a concept of God or a given world view, holding that it was unnecessary to go beyond the view of life as autonomous and humanly constituted. Secular human values were accorded an independent interest for their own sake. Petrarch affords an outstanding illus-

tration of this turn of mind; for him the decisive fact was the individual experience of life and its representation without reference to the Christological concepts of the Middle Ages. The experience of a soul, still essentially Christian, finds its expression without consideration of sin or merit. To represent the human moods of suffering and joy, yearning and love, and to transfigure them into poetic form are sufficient. This immediate interest followed another approach in the work of Boccaccio, whose main theme was the manifoldness of human life and human existence regardless of any religious significance or evaluation. The sovereign force in this world is not divine Providence but Fortuna.

The background for the poets and thinkers of the *trecento* emerged largely from mediaeval constructions. The only solutions possible for the individual who sought an explanation of his fate or who searched for some ultimate goal were those represented by the traditional religious conceptions. The present world had meaning only in terms of the world to come. Such explanations however, no longer forced themselves on the mind. Man could now live and understand himself without recourse to the traditional religious concepts.

Only during the later period, and primarily among the Florentines, did there develop a new conception of the world and man independent of the Christian mediaeval world view. The cleavage between this world and the next was obliterated; the other world was in a measure absorbed into the present. Through beauty the higher world is revealed on earth. The transcendent world is now posited in the soul of man, expressing itself in man's ceaseless striving. This striving, it was held, particularly by Ficino and Pico della Mirandola, represents the dignity of man.

The school of Padua, on the other hand, looked to those elements which were by nature common to all as a key to man's worth. The question was not to sublimate man but to determine the essential character of the genus Homo. Man cannot go beyond himself. He is bound by the world which surrounds him. Every individual is but a part of a higher humanity, in its turn a part of the universe, all embracing and definitely ordered. This approach was characteristic especially of Pomponazzi and Cremonini.

Man's return to himself was characteristic also of the development of the Renaissance in the other lands. Thus Erasmus became the

representative of a new humanity. The personal and human were divorced from the cosmic, and the immediate experiences of life were no longer subject to speculation. Man turned away from all problems transcending the human. Permanence and stability were found in human factors apparent to man. A conscious worldliness posited upon man's own purposes thus developed and humanism was transformed into a feeling of humanity, self-sufficient and without need of appeal to specifically religious Christian concepts.

In this development of new conceptions there were certain transformations and revaluations which were of decisive significance for the creation of new social types. The Florentine idea of an intellectual and spiritual superman led to a new ideal of education. Men looked to a sort of intellectual and spiritual aristocracy, whose claims to social primacy were no longer based on feudal sovereign rights but rather on superiority of culture.

There was an earlier and more effective fusion of classes in the Italian communes of the *duocento* than elsewhere. The nobles who had come into the cities became in turn the representatives of the new urban spirit, and the distinction between burgher and aristocrat became less sharp. Nobles also engaged in trade, investing it with dignity and wealth. In time there emerged a new upper stratum of society founded on acquired wealth. The educational ideal of the Renaissance contributed to the process of consolidation and legitimization of this new upper class. It was not because of their wealth but rather by reason of their culture, made possible by their material well being, that its members enjoyed a natural superiority over the uncultured toiling masses. Humanism supplied the material basis for this new educational ideology. The educated were distinguished from the uneducated by their knowledge of the classical languages and by the acquisition of a certain erudition.

The new educational ideal found its highest expression in the Florentine Renaissance. Here the doctrine of cultural superiority, based on the ideas of Plato, was metaphysically and cosmically grounded. In a sense it represented the legitimizing of a natural cultural aristocracy conditioned by the psychophysical character of man and the relative values of soul and body as representative of human nature. Just as the spirit was placed above the body, so the man who represented the highest development of the intellect and the spirit was more highly valued than he

who still remained in the realm of the sensual and corporeal. When aesthetic values were associated with this aristocratic cultural ideal, there arose the concept of the intellectual, spiritual and aesthetic type, representing the superior type of man as opposed to the mass of people.

At the same time the mediaeval hierarchical classification of priestly and lay was also materially modified. In place of the ascetic divorced completely from worldly life there emerged the intellectual and secularized man who identified himself with this world and filled his place in it. No longer was the problem one of overcoming the nature of man but of developing it to the highest degree within a secular society. Spirituality and corporeality were no longer distributed between two worlds but were together conceived as providing the principle of orderly classification within a unified profane world. In place of the saint there appeared the philosopher in whom, as the representative of pure spirituality, mankind reaches the highest achievement of the contemplative life.

The emphasis upon intellectuality presupposed leisure. Those individuals therefore who are occupied with the economic aspects of society are from the start excluded from this educational ideal. The intellectuals are the chosen few. Opposed to them stand the uncultured masses, the people. Since the intellectual and contemplative life was considered superior to the manifold duties of everyday existence, there developed the principle of social stratification, whereby the non-laboring intellectuals enjoyed a natural preeminence over the uncultured working masses.

The Florentine ideal of education was distinctly individual and aristocratic in character. There is an ideal type of intellect representing the peak of man's development. This ideal type is of decided significance for the development of the idea of pure intellect and beauty as expressed in the works of the poets and artists. The possibilities, on the other hand, of setting up educational norms which would serve to determine the intellectual standard of an entire class, particularly of the bourgeoisie, were limited. The emphasis on the value of the contemplative and aesthetic served to lower the value of the everyday activities of the burghers. The cultural ideal therefore must ultimately lead to the formation of a limited circle of intellectuals from which not only the masses but also the burghers were excluded (Castiglione).

In the Netherlands there arose a different

form of culture, rooted in the bourgeoisie and adapted to the middle classes. The Platonic and neo-Platonic sublimation of the intellectual and spiritual life and the development of a learning oriented toward antiquity found here a counterpoise in the rational and practical spirit of a rising bourgeoisie which discovered in the traditions of antiquity rules of conduct for its own use and which thus established the foundations of a morality at once Christian and free, in large measure, from dogma. The everyday life of the bourgeoisie here came into its own and was exemplified above all in Erasmus.

In France the new ideal of culture led to the evolution of a new aristocratic type having its foundation not in a recently arisen upper layer of society, as in Florence, but in the existing social order. In the ruling upper class there developed in time a definite worldly mode of life and a regulated social culture, which reached its apogee in the seventeenth century and which, borrowing from the classical tradition, led to the concept of the cultured and aristocratic *honnête homme*.

In Italy too a reaction soon set in against the exclusive character of the Florentine cultural ideal. The representatives of the Paduan school taught that moral worth and not intellectual superiority was all important. They were interested not in speculations of man but in his actions. It is interesting in this connection to note the contrast between the Platonic-aristocratic intellectualism of the Florentines and the Aristotelian-bourgeois conception of the Paduan school, which received their full development only later in the humanist philosophers of the Enlightenment. The decisive consideration for the evaluation of man was a morality independent not only of all religion but also of all metaphysical speculation. In contrast to the intellectual and aesthetic Florentine type appeared the normal man whose significance was measured by his moral accomplishments.

This transfer of values from the aristocratic intellectual to the moral bourgeois did not, however, lead to the recognition of the worth of human activities as practised by the mass of people. For the Paduan school man's value inhered in his very nature. Proceeding upon this premise Pomponazzi held, however, that the individual who devotes himself to a definite activity no longer reveals his nature as a man. He pursues particular aims which divert him from what is purely human. The division of labor involved in daily activity impresses a particular-

istic stamp on the individual, which turns him away from the development of general human values.

Thus both the Florentine intellectual aristocrat and the Paduan moral bourgeois stood in opposition to the mass of the working people. The recognition by the Paduans of generally applicable moral values altered nothing in this respect. In fact it was rather among the Florentines that tendencies toward the recognition of the value of human activity developed. This did not, however, take the form of an appreciation of manual work, but was here likewise related to the problem of the intellectual superman. This superman is not a being who strives toward pure contemplation. His intellectual supremacy gives him power over nature as well. It is the task of the human spirit to create order everywhere and to reveal man's power in everything. The one-sided character of pure contemplation was thus overcome, and the concept of creative activity, invention and control of the material world by the intellect received independent significance. Assumption of power over the earthly world was viewed cosmically as an essential function of man.

Recognition of free creative activity by the Florentines was restricted, however, only to the intellectual ideal type. The superman is the individual who excels all his fellow men in their daily material functions. His value rests in his universality and intellectual superiority as revealed in all spheres of human activity (Alberti). His own consciousness of power is of greater significance than his actual activity, since he incorporates in his person the symbol of the intellectual and spiritual superiority of the free man over nature.

In Germany the problem of the value of general activity assumed a different form. Here the principle of the differentiation of an intellectual upper class from the mass of people on the basis of divergences in cultural development found only incomplete expression. The artisan spirit was not displaced by the ancient ideal of the purely intellectual man. The creatively active man, as Paracelsus conceived him to be, did not, like the Florentines, look upon his activity as a means of self-glorification. He was a Christian wizard in the service of God and man, related to all who carry on in the world below.

It was in the English Renaissance alone, however, that human activity in the modern sense of the word attained recognition. The intellectual superman seeking to express his individual

superiority gave rise to the conception of the philosopher, as Bacon saw him, who grasps the entire relationship of human achievements and who as leader and organizer opens new vistas and sets up new tasks. The type of the great entrepreneur directing the differentiated functions of all other men supersedes the isolated, self-sufficient individual whose goal is the many-sided development of his own talents. In this way the active man as such received a new evaluation. In place of contemplation primacy was accorded to human capabilities and achievements and scientifically regulated concrete activity.

In all these forms there emerged a new consciousness of man which was represented in the manifold aspects of human life. The Renaissance did not, however, bring about a new science of man in any real sense. Far more important was the development of new standards. Works of art, myths, stories, autobiographies, philosophical reflections, all served to arouse the self-consciousness of man. In no other epoch was the demand "know thyself" of such fundamental significance as in the Renaissance period, during which man looked to himself for the answers to questions which tradition no longer served to explain.

It would be incorrect, however, to underestimate the importance of tradition in the development of the Renaissance spirit. Of basic importance in this connection was the relation of the men of the Renaissance to antiquity. It is indeed false to reduce the Renaissance simply to a rediscovery of antiquity. Classical ideas and theories had wielded a steady influence all through the Middle Ages. A continuously progressive separation of classical traditions from their mediaeval Christian context was already apparent toward the end of the mediaeval period. However, the classical traditions which persisted during the Renaissance must be treated separately.

Of crucial significance is the Greco-Roman philosophy of life. The influence of the works of Cicero and Seneca made itself felt from Petrarch to Bacon. The man of the Renaissance found available in ancient philosophy a secular view of life independent not only of religious preconceptions but also in a large measure of all metaphysical ideas. Here was a combination of views on life, as well as of certain ever recurring themes susceptible of numerous variations, a ready-made vocabulary whereby the individual could put a purely human construction upon his ex-

periences. At the same time there were certain literary forms, such as letters, orations, dialogues, essays, in which man could express himself. Not certain fixed theories but primarily free variable ideas were applied according to the circumstances; these are reflected in philosophy and literature, in political addresses and historical presentations.

Greco-Roman philosophy thus transmitted to the Renaissance a comprehensive and thoroughly secularized view of life. This fact must be borne in mind in any attempt to determine the relation of the Renaissance to antiquity. The man of the Renaissance should not be conceived simply as an independent and self-determining individual who displaced the mediaeval belief in authority with the principles of autonomous thought. He was always in search of evidence which he could call upon for support of his own views. He did not therefore attempt to proclaim anything new but continued to value the sanction of the ancients. He felt the need of tradition and authority. In a certain sense he merely substituted one tradition for another. But the tradition of antiquity which he invoked did not present a unified system of doctrine. He could exercise his choice as determined by his own needs and inclinations. He looked to the thinkers of the past for a reply to his questions, which were those of a modern man, living under very different circumstances.

Thus there was no merely passive reception of tradition. In the colloquy of the modern man with the figures of antiquity, which was continued throughout the Renaissance period, modern man found an outlet of expression. He dared not speak only for himself. He did not have sufficient assurance to give independent expression to his own experiences of life. He sought to integrate them and anchor his ideas in tradition. But in so far as he exercised choice and applied the tradition to his own experience he preserved a certain independence toward traditional culture. He thus made use of antiquity for his own purposes, ordered the learning of antiquity in accord with his own problems, and his own individual bent became the deciding factor (Petrarch, Erasmus, Montaigne).

In this way the foundations were established for a secularized self-consciousness oriented toward the philosophic views of antiquity in place of the Christian view of life. The Renaissance development of Platonic and neo-Platonic ideas presents a different problem. The Platonic and neo-Platonic values and concepts represent

a continuously active factor in the development of mediaeval Christianity itself. The ancient idea of the soul as found in Plato and Plotinus asserted itself always anew against the specifically Christian conceptions of a personal God, of the concrete form of Christ and of the Christian account of the redemption as an actual historical event. This idea of the soul attained independent development in the Renaissance and led to a total transformation of the specifically Christian values. The human soul, no longer burdened with sin or repressed by the consciousness of guilt, rose to higher ascendancy. Human consciousness of power replaced Christian humility, *eros* took the place of *caritas*, human dignity of the consciousness of sin and trust in the dynamic power of the soul itself replaced the grace of God. God was no longer conceived as a personal being but as simply the infinite and absolute. The highest ideal of man was pure intellect and spirit, in which he found the fulfilment of his destiny.

There thus developed an independent secularized ideal, finding support in the Platonic and neo-Platonic philosophy, in which the ideal spheres were liberated from the mediaeval counterpoise of Christological principles and were to a certain degree secularized. The world of man itself became transfigured. A new cult of beauty arose which for a long time stood in contrast to the values and concepts of Christianity.

There was another series of ideas from antiquity which had a marked influence on the thought of the Renaissance, and which led to a change in the relation of man to the world. The mediaeval Christian looked upon this world as a transitory one that had to be extinguished before man could reach any immediate relation to God. In the Renaissance the cosmological conceptions of the ancients received independent significance. The classical affirmation of the world, of its spatial form, of its order and system, became dominant. Man belongs to this world, is a part of it and is an integral element of the whole. Such a cosmological view had been a continuous factor during the Middle Ages, but the religious feeling of the dependence of man on a personal God had remained supreme. In the Renaissance the world was simply taken for granted and looked upon as all embracing. Man considered himself essentially a creature of nature. The idea of divine creation, the question of the religiously determined meaning of the structure of the world, the conception of the world as the scene of the redemption, all receded into the back-

ground. Man no longer wondered whence he came and whither he was going. He sought to look at the world itself and to find his place in it.

This view of the universe does not belong particularly to any Greek system. It was characteristic of all antiquity. In modern times it became of fundamental significance for scientific thought. During the Renaissance there was a new realization of the concrete multiplicity of things. The thought of antiquity was not sufficient for this view. The ancient philosophers indeed subscribed to the conception of a universal order, but it was the possibility of applying this idea of a general orderliness to individual phenomena which constituted modern scientific thought. The preparatory work of the Renaissance in the direction of explaining concrete individual phenomena in their general relationships was brought about by the artistic perception of the concrete and its descriptive presentation. Nevertheless, the Renaissance was unable to harmonize these two ideas: the traditional, carried over from antiquity, of a general order; and the new sense of the individual and concrete.

The man of the Renaissance looked upon the world as a vast complex of phenomena. In this world, which appeared to him as more or less chaotic and miraculous and whose laws were unknown to him, nothing seemed impossible. In place of the faith of the Middle Ages the Renaissance substituted a general belief in wonders, which did not exclude Christian miracles. The world of the miraculous was merely expanded into infinity and the miraculous conceptions were decentralized. The Renaissance man conceived of a universal magical tradition embracing the ancient peoples and ages, of which the various religions are only more or less partial revelations (Pico della Mirandola, Bodin, Campanella).

The break up of the mediaeval Christian world in the Renaissance therefore did not signify the development of a secular view of the world in the modern sense, for which the scientific conditions were as yet non-existent. It is likewise incorrect to assume that within the Renaissance there was a progressive development of a scientific spirit bent on creating these conditions. In fact the *trecento*, during which a secular conception of the world, to a certain degree excluding the miraculous from its sphere, developed alongside the religious view of the wonder world, was more modern than either the *quattrocento* or *cinquecento*, during which all

those wonder concepts hitherto related to the Christian other world penetrated into the life of man and developed freely outside the bounds of any divine world order within the spheres of the astrological and magical concepts of the Renaissance. The general credulousness of the Renaissance must, however, be distinguished from the dogmatic faith of the Middle Ages. The mysteries of the world which the man of the Renaissance sought everywhere did not represent a set of facts that could be definitely determined. The mediaeval faith became transformed into a more or less vague perception of secret forces at work throughout the world. It is also quite possible that here too man was eclectic, deciding in favor of one form of belief in miracles as against another, rejecting one miracle while recognizing another. The man of the Renaissance would not deny the possibility of any imaginable phenomenon. This possibilism is one of the most essential characteristics of the Renaissance. Although no one can know definitely that an unknown phenomenon actually exists, no one can deny the possibility of its existence (Ficino, Pomponazzi, Cardano, Montaigne, Shakespeare).

Reflecting upon his own life from these aspects the man of the Renaissance felt that he lived in a world ruled by chance where everything was in a continuous state of flux. He sought security in himself in order to resist the unforeseen. This idea of the ancient sages was revived in a variety of forms. Alberti as a bourgeois thinker sought to escape the dangers of chance by clever calculations. Machiavelli provided the statesman with rules whereby he could take up the struggle with Fortuna. Out of the vast multiplicity of historical events, in which there was no rational order, he sought out instances that he thought were typical and recurrent in order to determine the political conditions of the time and the possibilities for effective action by the intelligent man. Man can never master Fortuna, but he can adapt himself to her.

In the background there always remained the unknown world, immense in the complexity of its phenomena and possibilities. This world could be comprehended only in the multiplicity of the phenomena which present themselves to man as seen by the artist (Leonardo da Vinci) and not as a methodical and rational whole. A new conception of the world came only with modern scientific consciousness, which marked out a clear line of demarcation between reality and fiction. A new conception of truth arose

which was founded upon the insight into the necessary and mathematically deducible order of reality (Galileo).

The new scientific spirit progressed but slowly. The Counter-Reformation led to a reorganization of the world upon an ecclesiastical Christian basis. On the other hand, the relation of fiction to reality became identified with the problem of life as presented in Torquato Tasso and Cervantes. Finally, in England the Renaissance spirit came into conflict with the newly developed Protestant religious consciousness. The individual concerned with the salvation of his soul could not feel content with mere existence in the world of possibilities and a purely speculative and imaginative relation to the complexity of things. He searched through faith for security and stability, which the Renaissance could not offer him (Greene, Dekker, Donne).

It is a difficult task to appraise the significance of the Renaissance in the history of European cultural development. The Renaissance represents a peculiar stage in this development which distinguishes it from the Middle Ages as well as from the modern period. The man of the Renaissance lived, as it were, between two worlds. The Christian world of the Middle Ages, in which the significance of every phenomenon was ultimately determined through uniform points of view, no longer existed for him. On the other hand, he had not yet found in a system of scientific concepts and social principles stability and security for his life. He was suspended between faith and knowledge. The Renaissance may be interpreted in different ways, depending on whether this epoch is more closely associated with the world of faith of the Middle Ages or with the scientifically grounded approach of modern times. In the same way it is apparent that the Renaissance was not a definitely fixed and circumscribed epoch. The retrogression of Christian ideas and values in the actual interpretation of life was a gradual process which set in toward the end of the Middle Ages and whose results cannot be determined unequivocally. For it was a matter not of conscious negation but rather of transformation in the relations between the religious and the secular spheres of life brought about by experience. Nevertheless, it must not be assumed that the Renaissance had no historical originality. Its characteristic realm was that of perception and the lingering with the object perceived, the sense of the multiplicity of phenomena coupled with the free development of the imaginative powers.

This explains the cultural significance of art and poetry in the Renaissance. Only in poetic and artistic representation and invention could man realize the multiplicity of phenomena not yet subjected to systematic knowledge. Poetry and art were conceived as the actual organs of world understanding. The artist or the poet of the Renaissance found his world in that intermediate realm of potentiality which was limited neither by a dogmatically determined faith nor by the rigid systematization of scientific data.

The preliminary conditions for the modern world were not created until the postulation of certain methodological fundamentals on the basis of which a realm of knowledge secure unto itself was made possible. The *varietas rerum* of the Renaissance then reverted to certain fundamental laws. In place of the world of fantasy came a world which could be comprehended and calculated. In the same way life itself appeared as something which could be regulated and controlled. The Renaissance concept of Fortuna was discarded. Man from now on put his trust in reason; in the political field this led to a thoroughly developed political system and a rational view of society.

RENAN, ERNEST (1823-92), French Hebraist, historian and philosopher. Renan was educated for the priesthood, but partly through philosophical skepticism, although more fundamentally as a result of his philological studies, he was forced to reject ecclesiastical dogma. He therefore left the seminary and completed his training at the University of Paris. His doctoral thesis, *Averroès et Averroïsme* (Paris 1852, rev. ed. 1861), a study in mediaeval skepticism, revealed the amalgam of scholarship and artistry typical of his literary production. His *Histoire générale et système comparé des langues sémitiques* (Paris 1855, 3rd ed. 1863) made him the foremost Semitic scholar of France and opened the doors of the Académie des Inscriptions et Belles-Lettres, for which he later founded and edited the *Corpus inscriptionum semiticarum*. In 1862 he was appointed professor of Hebrew in the Collège de France; his course was closed almost immediately, but he was reappointed after the fall of the empire and retained the chair until his death.

Renan's *Vie de Jésus* (Paris 1863, new ed. 1870; tr. by C. E. Wilbour, New York 1864),

which at once scandalized the orthodox and made its author an international literary figure, was written among the Syrian hills, to which he had repaired after a visit to Palestine. An imaginative portrait based on extensive scholarship, the *Vie de Jésus* rejected completely the supernatural elements in the traditional narrative and treated Jesus as a merely human but exalted personality, whose innocent joy during His early ministry in Galilee was transformed as a result of the opposition of Jerusalem into somber vehemence. The book became the first of the eight volumes making up *Histoire des origines du christianisme* (Paris 1863-83; English translation, 7 vols., London 1888-90), in which Renan traced the vicissitudes of the church down to the death of Marcus Aurelius and the triumph of Roman discipline and organization over theological irregularities and heresies. Turning to the origins of these origins he produced *Histoire du peuple d'Israël* (5 vols., Paris 1887-93; tr. by J. H. Allen and E. W. Latimer, Boston 1886-96), an independent interpretation, although founded on German Biblical criticism. Here Renan's central interest lay in the development of the religious idea by the prophets, of whom he regarded Jesus as the last.

In repudiating Catholicism Renan transferred much of his hope for human salvation to science. Although his youthful *L'avenir de la science* remained unpublished until 1890 (Paris; tr. by A. Vandam and C. Pitman, London 1891), its message, implicit in numerous articles, such as those collected as *Études d'histoire religieuse* (Paris 1857; tr. by O. B. Frothingham, New York 1864) and *Essais de morale et de critique* (Paris 1859), was of tremendous importance in the diffusion of the cult of science. His philosophy is well summed up in his "Examen de conscience philosophique" (in *Revue des deux mondes*, vol. xciv, 1889, p. 721-37). Accepting the relativity of human knowledge but stressing the practical adequacy of the maximum degree of probability, he viewed the universe as a process of becoming, in which no transcendent will intervenes to disturb the course of internal development. While he looked upon science and reason as the implements of progress, the interpretation of science which he stressed was less the conquest of inorganic nature than the knowledge of the gradual evolution of the human mind; and in any case he was acutely aware of the irrational elements in progress. His reference to a voice from the other world that speaks to man in the accents of love, religion, poetry

and virtue—the four great human follies because they are the four great negations of calculating egotism—was a poetic rendering of his thesis that man works instinctively for the ends of the universe, for the unfolding of the human consciousness, hoping that God is good. He conceded that God and immortality might perhaps exist beyond the boundaries of the finite; but irrespective of that possibility religion, not as abstraction but as image and symbol, was an essential human need. It is thus obvious that in Renan's unsystematic and often elusive philosophy positivism was fused with an evolutionary idealism.

Renan's characteristic deprecation of dogmatic finality is apparent also in his numerous political writings, some of which are included in *La réforme intellectuelle et morale* (Paris 1871), *Questions contemporaines* (Paris 1868) and his earlier collection of essays. While admitting the theoretical tenability of socialism he insisted that in practise it was incapable of reforming society, since universal happiness could not be based on political and economic measures. Democracy and social democracy served, in his opinion, only to generate materialistic self-interest, individualism and mediocrity and constituted a menace to the state, which could never attain greatness, that is, could never contribute to the divine aim of humanity, without individual sacrifice and discipline. Renan would have preferred government by an élite of intelligence or an aristocracy of competence, aware of its obligation to protect and guide the masses. In place of universal suffrage, he proposed that the senate be elected by national groups and corporations. In his famous lecture, *Qu'est-ce qu'une nation?* (Paris 1882), he analyzed the nature of the national group and concluded that the bond of union was moral and spiritual consciousness rather than race, language or boundaries.

Much of Renan's mature thought is found in allegorical form in the *Drames philosophiques* (Paris 1888). In his late writings the strenuous Renan seems to have become an interested observer of the world. This attitude, superficially interpreted, enabled certain youthful admirers to invent what was called *Renanisme*, a pose of sophisticated indifference toward everything serious which was utterly alien to the character of the master himself.

I (Paris 1923).

RENAUDOT, THÉOPHRASTE (1586-1653), founder of French journalism and of various institutions for social betterment. After graduating from the medical school at Montpellier in 1606 Renaudot entered the king's service first as a physician, later as a historiographer. Touched by the hordes of paupers who infested Paris after the wars of religion, he opened the first employment agency. In 1631 he established what is generally regarded as the first French newspaper, the *Gazette*, later called *Gazette de France*, which appeared weekly up to 1914. Both Louis XIII and Richelieu, realizing the power exerted by the press upon public opinion, contributed to the *Gazette*, and Richelieu granted Renaudot a news monopoly. Later the paper served the cause of Mazarm. Its "extras" are historically valuable, since they were devoted to official documents and to important current events; advertisements were published separately. Renaudot also conceived the notion of public auction sales and founded a pawnshop in imitation of those started by the pope in Italy. His other innovations included a dispensary, where more than 20,000 received medical treatment, and, in anticipation of the Academy of Sciences, a learned society, whose purpose was to give a weekly lecture, followed by a symposium, on any subject other than theology and politics. In applying chemistry to medicine and in opposing clinical pedagogy to scholasticism he aroused the ire of the University of Paris. After the death of his protector, Richelieu, all his "innocent inventions," with the exception of his newspaper, were suppressed by the Parlement of Paris, but they exerted a lasting influence upon the institutional development of France.

RENAULT, LOUIS (1843-1918), French jurist. Renault taught at Dijon and at the University of Paris, where he was professor of international law from 1881 until his death. He lectured also at the École Libre des Sciences Politiques, the École Supérieure de Guerre and the École Supérieure de la Marine.

Renault is regarded as the most important figure of the French school of international law, the founder of international law as a legal science in France. In his teaching he developed a position midway between the extremist views of Pufendorf, who regarded international law as a simple application of the principles of natural law to the relations of states, and of Moser, who conceived of it solely as positive law arising necessarily from customs and treaties. Taking account simultaneously of both the realistic and ideal elements Renault leaned toward the former, holding that abstract notions of justice should be invoked only as a basis for criticizing or evaluating positive international law. International law thus becomes variable and uncertain, but on the other hand it remains alive and practical. The ideal which was to be pursued must also, according to Renault, be realizable and founded upon social necessity.

Renault's teaching by virtue of its quality and variety exerted a unique influence upon the development of international law and gave a tremendous impetus to French studies in this field. He divided his attention between general problems of foreign relations, such as neutrality, and studies of contemporary situations, such as French relations with oriental countries. His work also covered subjects more narrowly juridical in nature, including industrial property and international penal law.

In 1890 Renault became counselor to the Ministry of Foreign Affairs. He concentrated his attention upon the actual constitution of international law and from 1893 to 1912, through consultation and active participation in international conferences involving questions of both private and public international law, he contributed to positive diplomatic achievements. He served as arbitrator in a number of international disputes, notably in the case of the "deserters of

Casablanca" (1908-09), and was awarded the Nobel peace prize in 1907.

Renault was the author of a great number of monographs, doctrinal studies and reports, largely on international law. Many of these were published in the *Recueil de jurisprudence de Sirey*, the *Journal de droit international privé*, the *Revue critique de législation et de jurisprudence* and the *Revue de droit international et de législation comparée*. His *Précis de droit commercial* (2 vols., Paris 1884-85), written in collaboration with Charles Lyon-Caen, was a study of all important aspects of commercial law and met with such success that the authors prepared from it a *Manuel de droit commercial* (Paris 1887, 15th ed. 1928) for student use and a *Traité de droit commercial* in eight volumes (Paris 1889-99, 4th-5th eds. 1914-32).

RENOUVIER, CHARLES BERNARD (1815-1903), French philosopher. After writing several youthful essays inspired by a sort of Hegelian pantheism Renouvier soon adopted a different type of philosophy, based on the idea of freedom of belief and judgment and on the arbitrary choice of rationalistic principles. In the logical organization of this philosophy, from which Renouvier's conception of social facts and history followed directly, the starting point was the law of contradiction and the inconceivability of an existential or actual infinite. From this he proceeded to deduce the existence of discontinuity in nature—first beginnings as regards both the origin and the course of phenomena—and the freedom of the will as the indispensable condition not only for ethics but also for any rational conception of society and human evolution.

Thus, contrary to the rest of his generation, whose tendencies were on the whole expressed by Spencer's system, Renouvier declared himself in opposition to the notion of a necessary evolution, of a progress assured in advance independently of individual wills. As early as 1857 he published a sort of philosophical novel, *Uchronie* (in *Revue philosophique et religieuse*, vols. vii-viii; 2nd ed. Paris 1901), a utopia as applied to history. Its subtitle, *Esquisse . . . du*

développement de la civilisation européenne tel qu'il n'a pas été, tel qu'il aurait pu être, explains clearly the guiding idea. Renouvier imagined that the Roman Empire from the time of Marcus Aurelius had attained, under a series of enlightened emperors, a better government than was actually the case; that it was thus able to avoid military anarchy and to absorb little by little the barbarian peoples as well as to assimilate the ideas of Christianity—in short he eliminated from the course of history both the great invasions and the Middle Ages. By thus drawing in his imagination a picture of continuous development of a completely rationalistic and antimystical civilization from antiquity to modern times Renouvier sought to emphasize the essential contingency of historical and social facts. The *Introduction à la philosophie analytique de l'histoire* (Paris 1864, new ed. 1896), which is part of his *Essais de critique générale* (4 vols., Paris 1854-64; rev. ed., 13 vols., 1875-97), and later his big work on the *Science de la morale* (2 vols., Paris 1869; new ed. 1908) developed the same principles in more abstract form and continued the attack on the idea of a fatalistic evolution of humanity.

The power of free will Renouvier did not regard as extending without limit: there are necessary laws of solidarity—solidarity of the individual with himself, solidarity of men with one another; arising from example, from imitation, they are perpetuated by habit, for there is a sort of "mental vertigo" which drives men toward the most intense or most familiar sensations. But there is also present in man and consequently in the social groups a power of freedom which, in the voluntary act of attention, fixes certain images or ideas by preference to certain others and can thus hold the passions in check. Will is above all unwillingness, a power of restraint, of doubt and criticism in the intellectual sphere, of deliberation and self-control in the practical. Through this power man is able to resist within certain limits the pull of the passions, both individual and collective, is capable of recognizing reason and desiring it; ethics thus retains both its autonomy and its right to judge history.

This does not mean, however, that ethics may neglect the conditions of fact and the part of necessity which results from them, if it is to be both equitable and practical. Indeed after having laid down on the basis of Kantian principles an ethics of pure justice and pure reason Renouvier recognized that such an ethics pre-

supposes the existence of mutual good will and peace, while history, on the other hand, is above all the theater of egoisms and of war. To demand under such a state of war an absolute morality would be to render life impossible; it would mean imposing sacrifice upon the good only and leaving the field free for the wicked, thus abandoning the cause of justice and increasing the amount of injustice and disorder in the world. It is necessary therefore that evil be resisted by force, that constraint and punishment be employed and that there be put at the service of justice means that are partially unjust. Always, however, the ideal of peace and of reason must remain the ultimate goal, which is to be approached in practise as closely as possible.

Such a realistic attitude poses the question as to why there should be any suffering, injustice and evil in the world. Even if ethics accepts what Renouvier calls the postulate of the moral order—the existence both in man and in the universe of a deeply rooted will for justice—yet the fact of the freedom of the will presupposes the possibility that through the very existence of man error and consequently disorder and evil will be introduced into the divine plan of the world and will accumulate their disturbing effects. This theory of the fall and the complementary possibility of the rise and redemption through the effort of good will provided the basic theme of Renouvier's *Philosophie analytique de l'histoire* (pt. v of *Essais de critique générale*, 4 vols., 1896–97). It is also reflected in the eschatological hypothesis which he elaborated in his latter works, particularly in the *Nouvelle monadologie* (Paris 1899) and *Le personalisme* (Paris 1903).

Renouvier's social and historical ideas, his moral individualism and his doctrine of the contingency of historical events have exercised an unmistakable influence on the cultural thought of his time. They are closely tied up with the fundamental philosophical principles of his doctrine, which in turn have had repercussions in the field of pure philosophy. As the philosopher of liberty, of the discontinuous and the finite Renouvier may indeed be regarded as the precursor both of pragmatism and of the various pluralistic doctrines of the present day.

RENT. The word *rente* occurred in old French of the twelfth century, derived from the vulgar Latin *rendita*, from *reddita*, meaning return or yield. In the same century it occurred in English in the sense of an item of revenue or income (Oxford Dictionary). With varied spellings and shades of meaning it has been used in all the modern European languages ever since. Still today in the law "the word . . . may be generally defined as a compensation or return" (*Corpus juris*). In popular speech it is now, and possibly always has been, used generally as the sum paid for the hire of anything to be returned in the same physical form, as tools, machinery, houses and so forth. Both in economics and in law, however, the word has been most frequently associated with the payment for the use of land, especially of agricultural land; and Alfred Marshall's basic definition is representative of widespread economic usage: "the income derived from the ownership of land and other free gifts of nature is called rent." It is true that Marshall adds: "the economist must stretch it much further," leaving the reader in doubt as to his exact meaning. In law the technical sense of the word is said to be "the compensation received by a landlord for the use of land leased" (*Corpus juris*).

This association, both in economics and in law, of rent with income derived from land resulted from the shifting of a more generic meaning to a specific use which happened to be most frequent in practise. Throughout the Middle Ages the cases of fixed contractual income which most often came before the courts in such matters as settlement of estates, and in modern times those which have attracted the attention of economic students were derived from landed property. A similar result of habit seems to account for the more recent peculiar use of *rentes* in French in the sense of incomes from investments in the consolidated governmental debt, *rentier* thus denoting a person who lives from the proceeds of coupons on public bonds. The use of rent in the special sense of an income derived from land while the more general meaning has persisted still contributes, no doubt, to the confusion of the whole concept.

English writers from the sixteenth to the eighteenth century used the word rent as meaning "interest" on a loan which is "only

Rent for Stock," as Sir Dudley North said (*Discourses upon Trade*, London 1691), and also in the more special sense of an income from land. Repeatedly too they touched upon the relationship between commerce and land values and the rents of agricultural land. The history of the modern rent doctrine, however, as essentially connected with land may be said to begin midway in the eighteenth century. Although the French physiocrats centered their whole system of the *ordre naturel* about land and its peculiar powers, they preferred to call the yield, or the income, from land not rent but the *produit net*, the "disposable revenue" or "the current price of leases." But the physiocratic conceptions of the three main classes in the nation, of the supposed exclusive power of land to yield a surplus above labor costs and of the assumed non-shifting quality of taxes on cultivated land doubtless influenced English economic thought in the period of Ricardo and subsequently.

Adam Smith's views on rent were far less affected by his physiocratic contemporaries than were those of English economists a generation later, for Smith saw in the magic power of division of labor rather than in the powers of land the bountiful source of the wealth of nations. His preliminary analysis of the price of commodities into its "component parts" of wages of labor, profits of stock and rent of land was much in the spirit of the psychological school of a century later. His further treatment of rent nevertheless was the most confused and unsatisfactory part of his imperfect scheme of value and distribution. He groped for a "natural rate" of rent as well as of wages and of profits but got no further than the suggestion that it is the "ordinary or average rate of rent, which is regulated . . . partly by the general circumstances of the society or neighborhood in which the land is situated, and partly by the natural or the improved fertility of the land"—a solution satisfying to the most eclectic mind. He then attempted to find a line of distinction between one class of "produce of land (food) which always affords and necessarily affords some rent to the landlord," and other sorts of produce which sometimes may and sometimes may not, according to circumstances (mentioning as examples fur, wool, stone, coal, wood and a variety of other natural materials). He glimpsed the modern conception of marginality in the latter case but ignored it in the former. The easy disproof of this hazy doctrine of the two classes of products helped to convince the Ricardians

of their superiority over Smith and to confirm their belief in their own false views of land rent.

Adam Smith's inexact ideas of a bare subsistence as the natural wage and of the power of land ordinarily to "produce a greater quantity of food than what is sufficient to maintain all the labour necessary for bringing it to market" bloomed into the Malthusian principle of population near the close of the century (1798). The peculiar circumstances of the next two decades, with continued war, excessive taxation, curtailment of food imports, unprecedented prices for wheat in England and inflated agricultural rents, served to magnify to abnormal importance the subjects of population growth and land rents. The so-called Ricardian doctrine of rent was independently formulated by several other writers—West, Malthus, Torrens and others between 1813 and 1815—when wheat prices were at their peak. It was destined to play a dominant role in economic theory until after the middle of the nineteenth century and thereafter gradually to lose its prestige.

It is not possible accurately to compress into a single proposition the whole Ricardian rent doctrine for in it several criteria of rent were combined and confused. Even the following analysis does not exhaust the minor details and differences. In the first place, the source of rent was deemed to be distinctly and peculiarly land, used as a mere geographic or geological term. Along with labor and capital land was one of the three factors of production, paralleled by the three incomes—rent, profits (including interest) and wages—and by the three classes of income receivers—landlords, capitalists and laborers. This tripartite arrangement corresponded fairly well with the main divisions in politics and in English society at that time. Secondly, land was regarded as unproduced, it being conceived as essentially a natural not an artificial agent, having therefore originally no psychic cost, in contrast with the psychic sacrifice involved in making, improving and modifying other things, which were thought to be ruled by the labor theory of value. Again land, even agricultural land, was considered as durable by its very nature, and its useful and fertile qualities were taken to be permanent. As a corollary the rent income was assumed to continue without limit and without impairment of its source, in contrast with physical capital. Land was looked upon as peculiar in that it alone among economic agents was subject to the law of diminishing returns, a doctrine which confused the idea

of proportionality between two or more complementary agents with the idea of a historical trend toward less productive land and land uses. Further, land rent was assumed to be of a peculiar residual, or differential, nature, in contrast to wages, profits and interest, in which no differential quality was seen at that time. Closely related was the idea that land rent was peculiarly a surplus above cost (practical business cost), and moreover the one income that "formed no part of price." This was a mere play on words and was not meant to deny that the actual prices of all products where scarce land was used contained rents as well as wages and profits, or that rent formed part of the necessary competitive expenses of the enterpriser. The phrase involved a garbled marginality theory, which amended the words "formed no part of price" by the addition: of that portion of the supply which fixes (or determines) the price of the whole. Recent criticism has pretty effectually disposed of the fallacious idea of a certain marginal unit fixing the price of the whole or of the other units in the marketing of any sort of goods or uses.

Land rent in the Ricardian doctrine was further regarded as peculiar in that taxes on land, agricultural as well as other, were not shiftable. Land being deemed to be not only unproducible but indestructible, it was concluded that the quantity of usable land and the mode of its use could not and would not be altered in any degree through the taxpayers' choice as a result of changes in land taxes. Finally, all land values and all rents were held to be of a monopolistic nature, no matter how widely distributed landownership might be; this was palpably a confusion of the idea of "natural" scarcity and that of monopoly in its proper sense as control and artificial manipulation of supply and of prices through unified ownership or by agreement.

The subsequent history of the rent doctrine is largely a record of hostile criticism of these inconsistencies in the Ricardian theory and of the attempts of Ricardian apologists, such as J. S. Mill, J. E. Cairnes and others of the neo-classical school, to qualify, reconcile and evade its logical consequences. Most ingenious and elusive of the attempts of this sort were those of Alfred Marshall. He conceded that the distinction between land (natural) and other wealth must be abandoned from the point of view of the individual investor (the original problem) but suggested retaining it from the point of view of

society. He then hopefully set forth still another property of land as "the ultimate cause of the distinction . . . between land and other things"; that is, the attribute of extension, or its geometric relations. Not satisfied with this, he further suggested making the distinction between rent and interest (and between land and capital) turn "on the length of the period which we have in view."

Since the word rent etymologically means any income or yield from an economic agent, its limitation to a more special sense involves something of the arbitrary. This can be justified ultimately only by a general consensus of opinion and usage. Modern theoretical criticism has not only quite effectually invalidated the crude tripartite division of the economic factors (based on the labor theory of value) which linked rent with land but has also in varying degrees exploded all of the other supposed peculiarities of land and of land rent. Proportionality, for example, varying on either side of an optimum, is seen as a universal phenomenon in the use of all kinds of goods, whereas a historical law of diminishing returns finds no support in actual conditions or in statistical trends in any of the advanced countries.

To the writer it seems that the most useful and tenable definition of the word rent today must turn upon the one economico-legal criterion of the nature of the contract by which the uses of any more or less durable agent of production may be bought or sold. The content of such a concept would include nearly all of the cases which in practice have ever been included under rent, but the concept would be essentially different. Capital in the financial sense and its yield—profits and interest—are fully within the price system, both the principal sum and the amount of the income being expressed in monetary terms; rent is ordinarily only half way within the price system, that is, in respect to the periodic payment; whereas the borrowed agent is returnable in kind or as nearly as may be in identical form (i.e. the criterion is physical or technological rather than financial). Indeed some cases of rent contracts, as, for instance, renting on shares, retain the still more primitive form of contract in which both the borrowing and lending and the payment are "in kind"; that is, not expressed in monetary terms. Rent would thus be defined as: the amount paid by contract for the use of the durable (separable) uses of a more or less durable agent (use bearer), entrusted by an owner to a borrower for a

limited period, to be returned in equally good condition except for ordinary wear and tear.

RENT CHARGE. The term rent charge in the mediaeval law of the various European lands may be defined untechnically as the grant by a landowner of a rent to be paid out of the income from his lands. In English common law it was accompanied with the power of distress in favor of the purchaser of the rent charge and was distinguished by certain legal details from a rent service and a rent seek.

At least as early as the twelfth century the purchase and sale of rent charges were used in northern Europe as devices for borrowing by landowners and for the investment of (money) capital by the burgher class. The development until the sixteenth century was therefore contemporaneous first with the crusades and the growth of towns through the purchase of charter privileges from neighboring feudal landlords, and later with the growing use of money and credit and with the steady decline in economic importance of the feudal classes relative to that of the merchant capitalists. In financial markets in the commercial towns fixed incomes in the form of rent charges were exchanged for capital sums involving a time discount rate and rate of yield quite as in a modern bond market. In the earlier period the yield was as high as 8 to 10 percent, but in later centuries it sank to about 5 percent and at times to even less. Unlike an ordinary "loan of money" secured by a mortgage on a landed estate, the rent charge escaped the disapproval of the church as a device for investing capital to obtain a fixed income without labor. The feature deemed of greatest importance in distinguishing technically the economic and therefore the ethical nature of the rent charge from an ordinary loan of capital was that the borrower (seller of the rent charge) did not contract ever to repay the sum; that is, it was a perpetual rent, without maturity date, although usually he had the option of redeeming it at will. The rent charge, while it is still a legal form of contract, has largely fallen into disuse with the development in the financial markets of other more convenient forms of investment sanctioned by both church and state.

RENT REGULATION. In the normal law of landlord and tenant dwellings are let according to the rules of property and contract. The landlord as owner of the dwelling can fix the rent of his property at whatever figure he chooses. If a tenant does not pay his rent, the landlord has such remedies as distress and eviction. Upon the expiry of the lease the landlord can take possession of his property, refusing to renew the lease for any or no reason. The competition between landlords is supposed to protect the tenant against the charge of extortionate rents.

In fact, however, the rental market has never been a free market. The difficulties tenants face in securing complete information of competitive offers, the custom in many communities of terminating leases and moving on one particular day a year, the segregation of races, nationalities and income groups in certain localities, create quasi-monopolistic conditions. The rental market is one of inequalities, frictions and lagging adjustments, in which the lower income groups in the large urban centers are provided with substandard housing in obsolete structures at a relatively high cost, despite legally prescribed standards of sanitation and safety.

While the history of western nations records many instances of far reaching governmental interference with relations between landlords and tenants, the intervention has generally been on behalf of the landlords, as in the case of the various enclosure acts in Great Britain. In Ireland, however, in the early 1880's the government did intervene to protect the tenant farmers by fixing their rental payments on more favorable terms than the landlords had been willing to grant.

The situation is explained, however, by other factors than the relationship of landlord and tenant, particularly by the absentee ownership of the British landlords, who were regarded as alien masters by their Irish tenants. When the latter, who had fallen into arrears, banded together to resist eviction with violence, the British government was forced to aid them by fixing rents. Rents were established either by voluntary agreement between the landlord and tenant, the agreement having the force of law, or, in default of such an arrangement, by a court. Once fixed the rental figure was to remain stationary for a period of fifteen years.

The most striking, certainly the most extensive intervention of governmental authority in behalf of tenants against landlords occurred during the World War in the field of urban

housing. The outbreak of the war precipitated a situation which in a relatively short time produced rent control by governmental authority not only in the countries at war but generally throughout the world. Moreover the conditions which made rent control necessary during the war continued and became more acute in the following years, resulting in the extension of rent regulation during the post-war period.

The first governmental intervention was the moratorium on rental payments declared by the French government on August 14, 1914, and extended in three-month periods to March 31, 1918, when the moratorium was superseded by a general act controlling leases and rents. This moratorium in France was followed by legislation in many parts of the western world. Great Britain, New South Wales and Russia passed rent control measures in 1915; Italy declared a partial moratorium in 1916; the Netherlands, Switzerland, Sweden and Germany enacted rent legislation in 1917. By the end of the war practically all countries in Europe had laws restricting landlords from raising rents and evicting tenants. Shortly after the close of the war the acute housing shortage and the rising unrest and mass protest of tenants led to additional control in the European nations and to new legislation in countries formed by the peace treaties and in India, the Latin American states and the United States.

In the United States the most elaborate legislative control of rents was put into effect in the District of Columbia in 1919 and in the state of New York in 1920. In some other states municipalities set up rent control commissions with powers to investigate rents and to mediate between landlords and tenants, and in varying degrees with powers of coercion. They were largely limited, however, to the use of publicity in securing a reasonable adjustment of rentals. The federal government also had power under some circumstances to control the eviction of soldiers' dependents and war workers and also to requisition buildings for the latter.

The circumstances which provoked rent regulation changed in character from the earlier period of the war to the late and post-war periods. At the outbreak of the war, although the number of vacancies increased because of the break up and amalgamation of many households and the decline of marriages, many tenant families with their men gone to war could not pay their rents. But as the war progressed, existing dwelling facilities in the urban and industrial

centers were rapidly filled with workers and their families who had migrated to the city to secure the new jobs and higher wages in the war industries. As vacancies disappeared, landlords pressed vigorously to get higher rents. The return of soldiers to civil life at the end of the war further accentuated this shortage. Marriages in all countries increased enormously, particularly in the urban centers. In addition many of the families which had abandoned separate households when their men members had been called into service sought again to set up separate establishments. The workers who during the war had migrated to the cities did not return to the farms.

Accompanying this sudden increase in the need for new dwelling units, during the war and for several years after the war construction of new dwellings suffered a decline amounting almost to complete cessation. This decline was greatest in the belligerent countries, where the governments, subordinating all other considerations to military necessity, mobilized all available man power, including skilled building laborers, and permitted new dwelling construction only by license. In all countries moreover building costs rose rapidly because of the competing demand for labor and materials in industries supplying military requirements, and capital loan funds sought the more profitable war investments rather than the slower returns on dwelling investments. After the war building costs rose even more rapidly as a result of inflation. The rent and mortgage restriction acts were an additional limiting factor, although it is doubtful whether they contributed materially to the stoppage of building. Taking advantage of the acute housing shortage, owners of dwelling accommodations sought to raise rents and to evict tenants who could not or would not pay the higher rents. In these communities or states where no rent restrictions existed the number of evictions mounted rapidly.

The resulting plight of the tenants could not be ignored. During the war military necessity required the maintenance of civil stability and morale; and after the war mass unrest was no less disturbing to the political governments undergoing or threatened with revolutionary overturn. Political expediency required that the owners of dwellings remain a subject class until the new housing provided by government financing and direction could establish rentals at a level against which tenants would not protest so violently. Moreover employers hoping for

lower wage levels looked with favor upon rent control as a factor which would eliminate one element of pressure for high wages when the expected and hoped for decline in prices should occur.

The purposes of the rent control measures were to prevent unfair rises in rent and to protect tenants against eviction because of inability to pay the current rent or the increases demanded by the landlords. In one manner or another they interfered with the rights of private property and with the freedom of contract. They secured the tenant occupancy of the dwelling even though the lease had expired and prevented the landlord from taking possession of his property. They denied the landlord the right to exact all the rent the traffic would bear. They prevented mortgage holders from charging more than a prescribed rate of interest and deprived them of the right of foreclosure, and in some countries where the housing shortage was unusually severe they restricted the tenants from moving and rationed dwelling premises.

The system of rent control varied with different countries and was conditioned by a variety of factors, including the extent of monetary inflation, the political philosophy controlling the government, the severity of the effects of the war, the difficulties of post-war readjustments and the political power of tenants. The degree and severity of control ranged from restrictions which were deliberately confiscatory and intended as devices for the socialization of housing to the mild control by those cities in the United States which relied merely upon conciliation.

In most European countries, particularly in the belligerent states, the rent base was fixed by legislative decree as of a given pre-war date. In the United States the rent law of the state of New York forbade extortionate and unreasonable rents, declaring a 25 percent increase in rent as presumptively extortionate but leaving the determination of "reasonable" rent to the municipal courts; in the District of Columbia the fixing of rents was left to a rent commission. In New South Wales a formula of "fair rent" was prescribed.

In the post-war period the governments in countries with extreme monetary inflation prescribed various multipliers of pre-war rents as the basis of the new rents. Landlords in the post-war decade were generally permitted to increase rents to cover various classes of money outlay, such as repairs, maintenance and alterations for accommodation of additional families.

In some European countries rents were indirectly raised by a tenant's tax, which, however, was appropriated by the government for new buildings designed to compete with the existing privately owned dwellings.

There was considerable variation likewise in the control of lease expiry. During the period of the moratorium in France leases were automatically extended, while the landlord was completely deprived of his rights of possession. In other countries, as also in France under later legislation, repossession was subject to various conditions, such as failure of tenants to pay rent, misuse of the property by the tenant or the owner's direct personal need for and use of the property.

The extent of the coverage of tenants enjoying protection varied from complete coverage of all tenants regardless of income and military service to a system of classified protection under which the maximum protection was given to tenant families whose heads were in military service and to lower income groups, leaving the class of rich tenants unassisted. Protection was defined also in terms of classes of buildings, those constructed after a given date being exempt, or in terms of specified localities or size of the municipality or town. In general the scope of protection was broadened in the years immediately following the war, while limitations were progressively narrowed during the latter half of the post-war decade.

In a few countries and cities control of rents was withdrawn in large part by the middle of the post-war decade. In Norway, Denmark, the Netherlands, Switzerland and Italy rent control was either abrogated entirely or almost entirely by 1930. For instance, in Italy moral suasion may be exercised by the Fascist corporation of house property owners. But rent control, although progressively liberalized as to increases of rents and the classes of protected dwellings and tenants, still existed by 1934 in most of the principal European nations; namely, in Great Britain, France, Germany, Austria, Czechoslovakia and Poland.

In the United States the termination of rent control was hastened by the fear of adverse action by the courts. In a case arising under the rent law of the District of Columbia the Supreme Court of the United States by a five to four decision upheld the constitutionality of rent regulation upon a theory of emergency [*Block v. Hirsch*, 256 U. S. 135 (1921)]. A few years later, however, in a second District of Columbia

case the Supreme Court hinted that such legislation would be valid only as long as the emergency lasted [*Chastleman Corp. v. Sinclair*, 264 U. S. 543 (1924)]. The decision rendered rent control in the District of Columbia impotent by 1925. In the state of New York rent control was not withdrawn completely until 1929.

Although the history of the last half of the post-war decade is one of gradual and progressive removal of control, in many countries rent control of some sort promises to remain as a permanent part of the general system of social control. The Housing Act of 1930 in Great Britain, for example, contemplates permanent control of low rent housing. Rent control in European countries moreover is an integral part of the administration of government subsidized and owned dwellings, in which an increasing percentage of the lower income groups live. Since the effects of rent control have been uniformly to fix rents in the controlled area considerably below the level which would have obtained in a free market, the private construction of new buildings has been discouraged and governments have been practically forced into some form of social housing.

Finally, the economic depression which began in 1929 introduced a new phase of rent regulation. Because of the deflationary trend of this period rents under existing leases often became oppressive and when interest was reduced by legislation seemed particularly unjust. At least three Australian states, Queensland, Victoria, New South Wales, and New Zealand have already intervened by passing rent reduction acts. Enacted since 1931, the statutes are scheduled to remain in effect for several years. They either reduce existing rents by a fixed percentage or leave it to the courts to determine the extent of reductions.

RENTENMARK was the unit of the transitional currency instituted in Germany at the close of the post-war period of extreme inflation. The value of the Rentenmark, available in the form of notes issued by the Rentenbank beginning November 15, 1923, was set at one gold (or pre-war) mark both for domestic purposes and in terms of the United States dollar, the only important gold standard currency at the time. The Rentenbank notes, however, were redeemable not in specie but in 5 percent gold mark bonds which represented a first lien imposed on all agricultural land (except that with a pre-war assessed value of less than 2000 marks) and on all business enterprises (except those employing no outside help after September 1, 1923); furthermore they were not legal tender, although government offices were compelled to accept them. The new currency was eagerly received by the population, which had no stable money for hand to hand use and was suffering from an acute currency shortage notwithstanding the enormous circulation of the old paper money and the "emergency money" issued by public and important private bodies. The stability of the Rentenmark hung in the balance for some months but was assured by the middle of April, 1924. With the reorganization of the Reichsbank under a new charter, which was connected with the Dawes reparations settlement of August 30, 1924, a gold bullion standard currency was introduced and the retirement of the Rentenmark was begun.

Several factors contributed to "the miracle of the Rentenmark"—the breaking of the vicious circle of inflation presumably through the introduction of a new currency without gold backing. This currency was apparently based on real values and therefore enjoyed the confidence of the masses, particularly in agricultural sections. The reform was moreover supported alike by conservative and liberal political parties. It appeared to meet the clamor for a purely national currency linked to some basic agricultural commodity and divorced from the control of the government and the Reichsbank; and it was satisfactory to those who opposed the emascula-

tion of the central banking functions of the Reichsbank and wished to leave a loophole for the reintroduction of the gold standard. The deciding factor was probably the absolute restriction of Rentenbank note issue, and the measures of the currency commissioner, invested with dictatorial powers, which made it feasible. The issue was limited at the outset to a maximum of 3,200,000,000 gold marks, the value of the capital and surplus of the Rentenbank. Of this amount the sum of 1,200,000,000 marks was allocated to the government to enable it to meet its current expenses and to pay its debt to the Reichsbank; an equal sum was to be employed in financing business and agriculture through the Reichsbank and other banks of issue. Since treasury bills could no longer be discounted with the Reichsbank, a rigid limit was set to the spending power of the government, whose budgetary deficits were the immediate cause of ever mounting printing press inflation. It was also necessary to impose a strict rationing of credit to business, whose dependence for working capital upon the Reichsbank was one of the major consequences of inflation. An important supplementary measure was the control of the foreign quotations of the Rentenmark through reduction of the supply of German currency in foreign markets. The strain of extreme deflation, which might easily have become intolerable, was somewhat relieved by foreign credits made available through the Gold Discount Bank organized in April, 1924. But the danger to the whole Rentenmark scheme implicit in the reparations obligations of the German government was not removed until the experiment was brought to a successful conclusion with the adoption of the Dawes plan.

RENTIER, meaning originally simply a holder of *rentes*, or certificates of the French governmental debt, has come to signify anyone living primarily upon the return from fixed monetary investments. The rentier is a passive income receiver, one whose stake in the system depends

upon past rather than continuing economic activity. He is thus to be distinguished on the one hand from the individual living on an income from a privileged position, such as the slave owner or member of a landed aristocracy, and on the other hand from the finance capitalist, whose income is derived from promotion and speculation although in the form of investment.

The classic picture of the rentier is that of the provincial Frenchman, inheritor of a modest fortune, to which he may have added by hard work and frugality, spending his later if not his earlier days in the leisure of an assured income, shrewd, critical of new fads, well acquainted with at least the simpler pleasures of living. As an outline picture of the most characteristic type of rentier of a particular civilization this description is true enough. It would have to be altered in important details to fit other times and cultures. For the rentier does not constitute a class or represent an organic social grouping; neither birth nor education nor position is necessarily his. He is distinguished solely by the source and character of his income in a money economy.

In general two chief types of rentier may be recognized. The true, or lifelong, rentier must ordinarily be an inheritor of wealth, however modest in amount. With the dissolution of older social ties the second type, what may be called the dependent rentier — the widow with her savings account or insurance money, the maiden aunt with her small inheritance, the retired business man with his annuity designed just to carry him through the remainder of his years — has become probably more important numerically. There should perhaps be included as a third type, come into existence largely in the twentieth century, the institutional rentier — the foundations and endowments deriving their income from fixed investments, cooperative societies and educational institutions which seek security of income from their investments. One thing all three groups have in common, their independence of continuing productive activity and, correlatively, their dependence on the stability of existing property relationships.

Security of income has been most commonly associated throughout history with the ownership of land; in theory it is being absorbed, no matter how inadequately, as a governmental function by modern states, through old age pensions, social insurance and unemployment schemes. But the rentier differs essentially from both the landowner and the pensioner. The large

scale landowner represents the apex of a feudalized society; the rentier, not the apex but a kind of rootless offshoot of a money economy. The holder of government securities is completely absolved from all interest in production, a remoteness never achieved by even the completely absentee landowner. The pensioner, on the other hand, has security of income only on condition of continuous labor; only in his latest years can he hope for the freedom of choice of activity of the rentier.

Historically, however, there is a close relationship between the large landowner and the rentier. For it was the manners and perquisites of the landed aristocracy which furnished the pattern for the newly wealthy of the seventeenth and eighteenth centuries. In England, where circumstances offered frequent opportunities to the city man for the purchase of old estates, this class was largely absorbed into the landed gentry. It was, as Sombart says, feudalized. In France, where such opportunities were rarer and the ideal was not the country squire but the Parisian courtier, the tax farmer or the merchant looking about for a place to put his accumulated wealth preferred to seek out monetary investments. Such investments, however, were rare throughout the eighteenth century. Most large trading adventures were financed by active participants, and save in the Netherlands government finance was on a completely unstable basis before the nineteenth century. In Holland an important rentier class came into existence in the course of the eighteenth century, as the opportunities for mercantile activities were cut off by the loss of empire, and the bourgeois turned from active trading to living on his revenues.

The first real opportunity for the rentier and the continuing symbol of his power came with the growth and stabilization of national debts. In England Pitt placed public credit on a solid basis during the Napoleonic wars; in France the constitutions of the end of the eighteenth century, in reaction against the preceding chaos of bankruptcies and repudiations, declared the public debt sacred. Throughout the nineteenth century there was an enormous expansion of the public debt of all the western countries. The bonds of some of the smaller states might go through default after default, but the French *rentes* and the English consols justified the faith they inspired as symbols of all the solidity and self-assurance of the middle class of the times. With the increasing penetration of the money

economy into all fields of activity the demand for safe investments for surplus wealth ran ahead of the supply of government bonds, and first foreign governmental debts, then railroad securities and mortgage securities came to be sought by the rentier. But such investments are always in danger of becoming speculations, and the public debt has remained his chief support.

It was above all in France that the public debt came to be held primarily by actual or potential rentiers. Distributed not through financial institutions but directly to the public through *comptoirs* set up in every town, it was easily acquired in varying amounts. Indeed the general reliance on public credit was one cause of the slow development of private corporate finance in France; again and again throughout the nineteenth century the government was forced to guarantee the interest on borrowings of public utilities, such as the railroads, in order to create a market for their bonds. In England, where the rentier was also important by the latter part of the nineteenth century, the earlier development of private financial institutions prevented any such dominance of public credit.

Safe investment opportunities alone do not produce a rentier class. Except for the dependent rentier, who is for most of his life not a rentier but a producer, representatives of the group have never been numerous either in Germany or in the United States until very recently. The psychology of a nation "on the make" is inimical to the enjoyment of a fixed income. California and Florida, havens for the rentier, testify by their very character to his uneasiness in American society.

The rentier, like all non-producers, is made possible only by a complicated social organization. A phenomenon of capitalism, he appears in numbers only in certain of its stages or forms. In a period of active advance the surplus wealth of society finds its way largely into the hands of the manipulator, whether merchant, manufacturer or banker. The rentier can exist at such a time, indeed it is largely in these periods that the surplus funds necessary to his growth are accumulated; but he flourishes best, the atmosphere is more congenial to his temper, in the lulls, when economic activity is stabilized or declining. Some writers, notably N. Bukharin (*The Economic Theory of the Leisure Class*, New York 1927), concentrating upon the parasitic character of the coupon clipper, regard the existence of a large rentier stratum in a society as a sign of decadence. This interpretation follows

from the more general Marxian position as to the exploitative nature of pure interest.

The sphere of activity of the rentier is that of consumption. But what the quality of that consumption will be is determined not by his character as rentier but by the cultural atmosphere in which he lives. It may be conspicuous and wasteful, but to assume that it is always so is to confuse the rentier with the plutocrat. One of the distinctive features of the rentier class at the apex of its importance at the end of the nineteenth century was the fact that it included so many small and middling fortunes. The spending of the rentier, as distinguished from that of the capitalist or speculative owner of securities, is marked by restraint rather than by abandon. In a new and rapidly changing economy it may constitute an unstable, luxury demand, a source of friction in the system. Where traditions are few, the rentier group is probably exceptionally inclined to faddism of all kinds. Being mobile geographically, it can easily congregate in resorts and tourist centers given over to frivolity and glitter. The same mobility makes possible the development of expatriate colonies of artists, such as those in Paris. But in older societies, where the arts of consumption have been longer cultivated, the purchasing power of the rentier group may be exerted in quite different directions. It may well be a definitely stabilizing factor, providing a steady demand for customary goods and services that keeps alive a whole series of local industries and thus restricts the sphere of capitalist encroachments. It is in such a society that the rentier exerts the greatest cultural influence, through his contribution to the art of leisure. But in general the tone of a society is set by the upper class, not by the rentier group.

In any society, however, the rentier group constitutes a solid body opposed to change of all kinds. The lifelong rentier, free from the outset to choose the pattern of his life, whether it runs in terms of idleness and travel, amateur scholarship or a completely professional devotion to science or art, is inclined to be strongly individualistic in his attitudes. The pressures of his life are personal and self-applied, the limitations moral and customary and not primarily economic. Separated from the necessity of active participation in the economic struggles of his time, he is likely to develop an aloofness varying from the philosophical to the unrealistic or purely callous. Politically he is apt to be inactive except when the status of his income is imperiled. Unlike the small business man, the pro-

fessional and the artisan, he is a potential adherent of either fascism or communism only in most unusual circumstances. For he is essentially a lover of the status quo, and his interests are those of the maintenance of property rights, especially the value of money.

The rentier group before the World War exerted a greater influence than its mere numbers would imply, for the rentier status constituted the goal of so large a section of the population. It was a curiously static kind of influence. The opposition of the rentier to social legislation, for instance, was never active as was that of the employer; indeed it was in many cases almost non-existent. The rentier everywhere insists upon the sanctity of debts; his voice is always raised against repudiation, a factor which has had international repercussions where a rentier group has been a large holder of foreign investments. Where the rentier represents an important part of the population, as in France, he is able to exert considerable political pressure and up to a certain point can secure respect for his interests. But where those interests come into conflict with the interests of the active business man, the rentier is well nigh helpless; for while the business man may make his greatest gains through disturbances in the economic system, the rentier depends upon stability and equilibrium. This divergence of interest can be seen in the case of the promoters as opposed to the investors in any modern corporation or better any holding company. In another sphere it appears in the differing interests of rentier foreign bondholders and active business imperialists.

In times of prosperity the rentier is easily carried along on the tide of economic advance. Such was the case throughout the nineteenth century. But when the national income shrinks, as it did everywhere after the World War, the claim of the rentier to a fixed share of that income may come to seem extortionate and intolerable to the producing classes. Since his claims can be honored only through the deprivation (by means of increased taxation in the case of public debts) of everyone else, in a really critical situation he must give way. His defeat is accomplished through repudiation and currency depreciation.

J. M. Keynes has compiled a rough index of the fate of the rentier, in the person of the holder of British consols, from 1815 to 1922. Using 1914 as a base year he measures the real income of the consol owner in several ways (see table). In 1924 Keynes estimated that since the World

INDEX NUMBERS OF PURCHASING POWER OF THE INCOME OF CONSOLS, 1815-1922

War fixed incomes had lost about one half their real value in England, seven eighths in France, eleven twelfths in Italy and virtually all value in Germany, in the succession states of Austria-Hungary and in Russia. The world wide depression which began in 1929 increased the real value of the incomes of some rentiers through the fall in prices but wiped out the entire value of the investments of others.

The rentier owes his position to saving, his own or that of someone else. A change in the attitude toward thrift or in the opportunities for saving therefore may determine the increasing or waning importance of the group. Throughout the nineteenth century the ranks of the rentier were constantly augmented by the accumulated funds of one middle class family after another; and as the tempo of capital building slowed down, particularly in England, many of the most wealthy families contributed of their members to the group. But the very multiplication of the rentier group in time creates for it a critical situation. First, in so far as the rentier's influence helps shift the dominant ideal from that of possession to that of consumption, it helps create an attitude inimical to further saving. In the second place, the rentier inevitably comes to represent the "dead hand of the past," the creditor whose demands press so hard upon the economically active that they are finally repudiated, by violence if necessary. Such repudiation does not kill the desire to save, but it does give a demonstration of the insecurity of savings that cannot be immediately forgotten, at the same time that it makes thrift more difficult for the great majority. The rentier has by no means disappeared. But recent circumstances raise the question as to whether he is not destined to be absorbed either into the ranks of the worker

with a modicum of publicly assured income security or at the upper end back into the ranks of vested interests based on other forms of property control.

REPARATIONS. The term reparations was selected by the statesmen of the Allied and Associated Powers after the World War to describe the payments in cash and kind demanded of the vanquished nations. The demands were based in part on the conception of simple restitution of physical objects, in part on that of compensation for injury done; but the older term indemnity, which had fallen into some disrepute at the end of the nineteenth century, was intentionally avoided (*see* INDEMNITY, MILITARY). All the defeated powers were subjected to reparations demands, but only the payments required of Germany will be considered here, since they constitute the most important and the controlling case.

The foundation from which the reparations clauses of the Treaty of Versailles were developed was President Wilson's Fourteen Points, presented January 8, 1918, as a basis for peace negotiations, and his subsequent elaborations of this document. Wilson's original relevant proposals were concerned chiefly with evacuations and territorial changes, but he later added that "there shall be no . . . punitive damages." Lloyd George had similarly and previously disclaimed any attempt to obtain a war indemnity or to shift the cost of military operations. In the pre-Armistice negotiations, however, the demand for mere restitution of destroyed property gave way to that for compensation for all damage done to the civilian population of the Allies and their property by German aggression. The Armistice itself contained extensive provisions for the restoration of physical objects and for deliveries of goods and equipment, and in addition reiterated the principle of reparation for damage done, but confined the prospective

levies to these limits alone. At the Paris Peace Conference, however, where war psychology and the quest for vengeance were still inevitably dominant, it was sought to override these limits and to include among the sums demanded of Germany not merely damages but, pursuant to the earlier extravagant demands of the allied statesmen, direct war costs as well. Only after a bitter struggle were war costs excluded from the charges to be levied; on the other hand, capitalized war pensions and also separation allowances were eventually added to the damage categories, despite their remoteness from that conception of reparation for direct injury to civilians on which Germany's acceptance of the Armistice terms had rested. In the light of events, even though not of strict legal interpretation, it is hence more realistic to regard the actions of the Allies in dealing with German reparations as having been controlled by the conceptions of military victory and military indemnity rather than by the original conceptions of war guilt and reparations literally understood. Indeed the entire question of war guilt (*q.v.*) was irrelevant to the reparations problem as it was actually treated.

The history of German reparations falls into a number of major and quite dissimilar chapters. In the first, which runs from the Armistice to the end of 1923, political and psychological forces operating in utter disregard of current economic realities were dominant. This first chapter is extremely complex and includes nearly a score of major international conferences. In it at least three main phases may be distinguished. In the first the Allies attempted, independently of the treaty procedures, to negotiate directly among themselves and with Germany in order to establish the size and character of Germany's reparations obligation, beginning with the allied proposals made to Germany on June 16, 1919, before the treaty had been signed. These efforts were wholly unsuccessful and were abandoned after the breakdown of the London Conference of February and March, 1921. This breakdown was followed by the first large scale application of the military and economic sanctions provided by the treaty, including a tax on German exports - measures which proved to be only a forerunner of the Ruhr occupation. Germany thereupon asked in April, 1921, for mediation by the United States and then offered, in order to satisfy its reparations obligation, either a capital sum of 50,000,000,000 gold marks at present value or annuities

totaling 200,000,000,000. The figures are especially interesting because they are substantially above the sums later accepted under the "final" Young plan settlement. But the United States refused to mediate, the Allies rejected the new offer, and the first phase ended without conclusive results in this direction.

This first period was not, however, wholly devoid of progress. As early as May, 1920 (at Hythe), tentative proposals had been advanced for setting a minimum total for the German obligation, for relating this total to Germany's capacity to pay and for connecting reparations with the interallied debts. The Brussels Conference of Allied Prime Ministers was held in July of that year; and also in July, at Spa, the percentage distribution of reparations receipts between the creditors was established: France 52 percent, British Empire 22 percent, Italy 10 percent, Belgium 8 percent, others 8 percent. Likewise there was arranged at Spa a coal protocol, which provided in its terms, for the first and last time, a direct incentive to induce the German miners to produce instead of merely trying to force them to work.

In the second phase, beginning in March, 1921, the Allies reverted to the basis of action provided by the peace treaty itself, which had come into force January 10, 1920. The scope of the methods which the treaty provided for the exaction and securing of payments from Germany is somewhat remarkable. They were: occupation of territory; coercion by financial, economic and other measures and reprisals; provision for bond issues; provision of a general "first charge" on the assets and revenues of the German Empire and states—this has been of uncertain meaning and ceased to have effect with the Young plan; deliveries in kind, of goods and of labor; and restitution of physical objects removed by German forces. The treaty had specified ten categories of reparations damages, including pensions and separation allowances and had provided for 100,000,000,000 gold marks in German bonds as a guaranty. It had also stipulated large deliveries in kind, particularly of coal, timber and dyestuffs; these had already been initiated. But it had left the determination of the total amount of the reparations obligation and of the manner of payment to the new Reparation Commission which it set up. Acting under the treaty procedure the Reparation Commission accordingly announced on April 27, 1921, that Germany's reparations liability had been assessed at 132,000,000,000

gold marks (\$31,500,000,000), in addition to certain smaller items; and on May 5 it notified Germany of the corresponding Schedule of Payments. Three series of bonds to this total amount were to be issued by Germany and might be sold by the creditor powers in the market (none was ever actually floated); two sets of annuities were stipulated to provide the funds for the service of the bonds, one fixed at 2,000,000,000 gold marks and one, variable, at 26 percent of Germany's exports; customs and other revenues were to be assigned as additional security; and under the British Reparation (Recovery) Act of 1921, and later under similar legislation in France, Germany was to reimburse its exporters for levies on imports into those countries, made by the respective governments and credited to reparations account. These terms provoked an acute crisis in Germany but were finally accepted. The first billion was to be paid over in cash within twenty-five days. The procedure of the Reparation Commission in dealing with the claims for damages submitted by the several creditor powers and with Germany's counter presentations and in subsequently assessing Germany's total obligation is of some interest. The claims were presented in terms of many different currencies and were so numerous that detailed examination of each was wholly impossible. The commission tried sampling but found it hopeless; at the end it made no pretense at apportioning the assessed total either between different classes of claims or even between countries. The figure finally reached was simply that sum to which the different members of the commission found it possible to agree. As shown by the commission's own statements this figure had no direct relation to the claims presented, and hence none to the original damage as such. Its lack of meaning in terms of economic possibilities was soon demonstrated.

Difficulties under the new regime developed almost at once. The mark began a new depreciation, partly in consequence of the frantic efforts of the German government to buy foreign exchange for transfer purposes; the real yield of taxation in Germany dwindled rapidly, so that ever larger borrowing was necessary to keep the government going; and by the end of 1921, in consequence of an inevitable prospective default, a partial moratorium had to be granted. The Wiesbaden Agreement reached on August 27 and signed October 6, 1921, providing for direct reconstruction of the devastated areas in France

with German labor and materials, was relatively ineffective in alleviating the situation and indeed was quite incapable of yielding any large flow of contributions to reparations—partly because the French industrialists and workers themselves objected to the resulting reductions in their own markets. Conditions in 1922 were no better. The mark fell still more swiftly, and the payments from Germany inevitably shrank. The French then became impatient, and Poincaré began to talk about “productive guaranties.” Finally, on January 9, 1923, the Reparation Commission again declared Germany in default, with France, Belgium and Italy combining to override the strenuous opposition of the British to this step. The treaty sanctions were at once applied, and on January 11 the French and Belgian troops moved into the Ruhr basin; the British took no part in this action. These measures ended the effort to act within the procedure laid down in the peace treaty as interpreted by the Reparation Commission and opened a phase of direct action.

The struggle in the Ruhr lasted from January 11 to September 27, 1923. In everything but name it was a renewal of war between France and Belgium on the one side and Germany on the other. The aggressors based their action primarily on the defaults declared against Germany by the Reparation Commission with respect to coal and timber deliveries. The Mission Interalliée de Contrôle des Usines et des Mines (the MICUM), a body of engineers, was therefore established to superintend such deliveries and, supported by large bodies of troops, rapidly extended its scope to cover nearly all the economic life of the Ruhr. The local population replied with so-called passive resistance—sabotage, neglect of French orders and the like. To this the Berlin government lent support both by its orders and by subsidizing all those whom the French dismissed or banished. For a time the passive resistance campaign was successful, but at the end of six months the depreciation of the mark had reached astronomical heights, the country was utterly exhausted, and on September 27 the German government in effect surrendered. Passive resistance was stopped, working agreements with the MICUM were negotiated, and by the beginning of 1924 the struggle of wills was over. France was once more victorious; yet the victory was once more of uncertain value. The franc had itself depreciated by a quarter, French credit was seriously impaired, and the post-war economic

recovery of all western Europe had been gravely retarded. Even the immediate net financial yield of the Ruhr occupation was relatively small. The French claimed for the period, from the Ruhr and Rhineland combined, a net profit of 479,000,000 francs on gross expenses of twice that sum, but these figures have been challenged by foreign economists and seem to have been much too high. The 1923 coal receipts, for example, were admittedly only 25 or 30 percent of those of 1922.

In this first main chapter of reparations history, which closed with 1923, the actual course of events was largely the result of a series of persistent and fundamental conflicts. One was the conflict between Germany and the Allies themselves, which did not cease with the Armistice and which for certain of the Allies is hardly stilled even today. Another was the conflict between Great Britain on the one side, and France, Belgium and in lesser degree Italy on the other. Great Britain was in the main attempting to face the economic and political facts as they actually existed, to negotiate and, being chiefly interested in commerce and industry, to accelerate the world's recovery from the war. France was concerned with security and with the emasculation of Germany on the one hand and with its own distorted budget on the other, whereas the recovery of world trade was of only secondary interest. As a result France was determined to uphold the peace treaty and the subsequent stipulations without modification, as though they were divine revelations. The treaty was of course legally valid, yet as time went on its utter irreconcilability with the actual facts and possibilities became ever more conspicuous and its effects ever more vicious. France sought every opportunity to enforce the letter of the treaty and twice resorted to the extreme sanctions it provided. England, although unsuccessfully, fought this policy throughout the whole period, believing that it could only defeat its own end, at least in the economic sphere, and that it would plunge Europe into new chaos. Belgium sided with France; and Italy, while less aggressive, voted with France on all critical questions. In this struggle the United States had no formal part. It had failed to ratify the Versailles Treaty; and although its unofficial observer on the Reparation Commission usually sided with the British, he necessarily had little influence on events.

A third conflict, ultimately even more important than these, was the conflict between the

Allies' insistence that Germany make reparations payments and their own utter unwillingness to receive these payments. France especially was urgently in need of money to balance her ordinary budget and to recoup her enormous outlays in rebuilding the devastated areas. Yet the history of the negotiations over deliveries in kind, of the various reparations recovery acts and of much of the post-war tariffs of the Allies themselves is little more than the history of the creditors' efforts to prevent Germany from paying in the only forms which were permanently possible—goods and services. The source of the difficulty lay in the fact that both the debtor and the principal creditor powers were highly industrialized societies, producing much the same general sorts of things. If the creditors allowed Germany to pay them in coal or machinery or even many chemicals, they were reducing *pro tanto* the home markets for their own producers of these same things. Until 1923 the lion's share of German deliveries in kind actually went to Yugoslavia, an agricultural country which could absorb them without disadvantage.

These various conflicts dominated the history of reparations from 1919 to 1923, until Germany, caught full between them all, was well nigh crushed out of existence; the reparations problem, gradually spreading its tentacles over nearly the whole of European politics and economics, at the end became the crucial problem of western society. The experience of these years showed conclusively the virtual impossibility of carrying out successfully international transactions of such complexity and duration without arbitral or judicial machinery.

With the year 1924 the Reparation Commission, the total obligation it had established and even the Treaty of Versailles itself receded into the background of the reparations problem and a new chapter began. As early as December, 1922, Secretary of State Hughes had proposed that reparations be taken out of politics, and—what had indeed been suggested as early as 1920—that they be submitted to an inquiry by experts. The proposal was reiterated by President Coolidge in October, 1923. Meanwhile the utter collapse of Germany after the abandonment of passive resistance and the sheer irrelevance to existing facts of the reparations charges as set in 1921 made it obvious even to the most stubborn that a new course of action was imperative, and that Germany must be put on its feet if any further reparations were to be

obtained at all. Accordingly on November 30, 1923, the Reparation Commission announced that it had decided to appoint two committees of experts, one to deal with German currency stabilization and the budget, the other with German capital abroad. The committees were soon set up, with American participation, went to work at once and reported in April, 1924. The resulting proposals took their name from the chairman of the first committee and were known as the Dawes plan. They were accepted by the several governments in the London Agreements of August 30, 1924, the necessary steps for enforcing them were soon taken, and the Ruhr was thereupon evacuated.

The Dawes plan was a remarkable document. It combined a thorough appreciation of existing economic realities with a skilful handling of the profound political and emotional forces involved on both sides. In particular it recognized that the economic rehabilitation of Germany was the essential first step, and it provided means for effecting this rehabilitation. Instead of attempting to re-assess Germany's total reparations obligation it set up a schedule of annuities running for an indefinite term and thus sidestepped the flat refusal of France to reconsider the global charge established in 1921. These annuities represented, for the first time, a sincere attempt to estimate Germany's internal and external capacity to pay and to adjust the required payments accordingly. The annuities began in 1924–25 at 1,000,000,000 gold marks, whereof 800,000,000 were to come from the proceeds of a new German external loan, and rose to 2,500,000,000 in 1928–29; the total for the five years was 7,970,000,000. Thereafter, using 1928–29 as the standard year, the annuities were to vary with changes in the value of gold of 10 percent or more and were to increase with an index of prosperity; an index of poverty was not provided. The funds were to be obtained from specified sources in specified ways, and elaborate security provisions were established. In largest part the plan simply created a system of taxation and transfer, under foreign supervision and at certain points under foreign control; but the German government as well as the creditor powers was to participate in the proceeds. A large bonded obligation was placed on the railway system, another on industry, the Reichsbank was reorganized, and a Transfer Committee was created to protect the currency and the foreign exchanges. These measures, promptly supplemented by the necessary Ger-

man legislation, thus recast at least the outward form of a considerable part of German economic life. But the changes were accomplished with little disturbance, and the subsequent administration of the plan seems to have been as nearly frictionless as possible. At the same time the measures taken gave Germany an essential breathing spell and laid the foundations for its economic recovery.

The details of the operation of the Dawes plan have been described frequently and need not be recapitulated here. The mortgages on the railways and on industry gave rise to little or no difficulty. They merely replaced a part of the pre-war debt which the inflation had wiped out, and the charges involved were not found excessive. The burden placed directly on the German federal finances was also moderate and even in the standard year amounted to less than a fifth of the federal budget. At the same time the provisions of the plan had both compelled Germany to put its finances on a strong basis, thus greatly increasing its governmental income, and had enabled it to benefit largely from the reorganization. The total internal burden established was one which Germany proved able to carry without serious internal strain. In addition Germany was placed in a protected international financial position by the Dawes plan, for the Transfer Committee was obligated to allow transfers to the creditor powers only in such amounts and at such times as would not endanger the stability of the new currency. The factors which had contributed so largely to the preceding collapse—pressure by the German government to buy foreign exchange for reparations transfer purposes, and the continuous threat of arbitrary and unexpected additional demands from the creditor powers—were thus eliminated. Moreover for the period 1924–29 as a whole more than half of the payments credited to Germany were made in the form of deliveries in kind or of other payments in marks. These large operations in themselves exerted no pressure on the foreign exchanges, although difficulties over the unwillingness of the creditors to receive payment in goods were chronic and serious, as in the earlier period. But the plan as a whole worked well. Germany made payments promptly and in full, and the international political forces which had so disastrously wrecked the previous endeavors to obtain reparations were kept in check. Nor did the distribution of the proceeds among the creditors give rise to trouble. With allowance for certain

priorities, especially the service of the external loan of 1924, substantially the Spa percentages of distribution were retained. The United States received, against awards, claims and army costs, nearly \$24,000,000 in the last year of the plan but did not share in reparations proper.

The inauguration of the Dawes plan was followed by a gradual reversal of the whole trend of German economic life. The currency, which had already been precariously stabilized on the basis of the Rentenmark, rapidly found a firm footing; general business, after an initial post-stabilization crisis, began first to revive and then to expand; and a growing volume of foreign loans made good the capital losses of the war and inflation periods and permitted new growth. By the end of 1928 Germany had regained in most directions the economic strength and the general levels of current material welfare which it had had in 1913. This remarkable and rapid recovery was in very large part attributable ultimately to the conditions which the Dawes plan set up and to the new internal developments which it stimulated, especially to its modification of an impossibly large and arbitrarily enforced reparations burden. The extent to which recovery was built on unstable foundations will be considered presently.

Before the end of the first Dawes plan standard year, 1928–29, however, still another chapter of reparations history had begun. The plan had worked so well that many of the statesmen of the creditor powers thought a permanent and final settlement could now safely be substituted for the transitional arrangement. At the same time they were anxious to “commercialize” a substantial proportion of Germany’s payments; that is, to receive bonds which they could sell in the market, thus getting possession of large capital sums at once, in place of their existing right to variable annuities. These suggestions aroused both opposition and fear in Germany. It was pointed out that if Germany’s existing obligation to make merely an indefinite series of annuity payments to the creditor powers were replaced by obligations of fixed amounts and terms owed to foreign private investors, it would be necessary to abolish the transfer protections and also the clauses permitting variations (after 1928–29) in the payments with the value of gold and the index of prosperity; and it was asserted that these surrenders of safeguards would of necessity require a large reduction in the amount which Germany could safely undertake to pay. The creditor

powers nevertheless went ahead and convoked the conference, held in Paris in the spring of 1929, from which the short lived Young plan finally emerged. The new plan was put into operation by the Hague Agreements of 1929-30 and was made retroactively effective from September 1, 1929.

The Young plan set a definite total amount and duration for Germany's reparations obligation; it still further reduced the size of the obligation itself; it provided for commercialization of part of the payments; and it abolished most of the Dawes plan machinery of supervision and control within Germany by the creditor powers. It also did away with the value-of-gold provision and the index of prosperity contained in the Dawes plan; and it removed much, although not all, of the previous transfer protection. Finally, abolishing the Reparation Commission, it provided for establishment of the new Bank for International Settlements, eventually placed in Basel, to collect and disburse Germany's payments and to serve as a center for international financial coordination (*see* CENTRAL BANKING).

The Young plan annuities were to run for fifty-nine years, until 1988. Their total was 121,000,000,000 marks (\$28,800,000,000), a sum actually far less than the figure of 132,000,000,000 set by the Reparation Commission in 1921, because the latter was a principal sum. The "present value" of the annuities was only about 37,000,000,000, a figure also somewhat less than the final German offer of 1921. The annuities, set on a slowly rising scale, began at only two thirds of the standard Dawes plan annuity, and the average (2,000,000,000 marks) was only four fifths as large. Until 1965-66 the annuities not only were to cover the aggregate payments which the reparations creditors as a whole were in turn obligated to make to the United States on interallied debt account but would leave a substantial disposable surplus in addition, equal to some 35 percent of the total annuities for the fifty-nine years. After 1965-66, however, the annuities would drop to approximately the level of the debt payments alone and the surplus would disappear. It was further provided that if the United States later reduced its claims on the Allies, the annuities should be diminished by two thirds of the reduction to 1965-66 and thereafter by all of it. The larger fraction of each annuity was given limited transfer protection, entailing postponements when necessary up to two years; but 612,000,000 marks a year

(\$146,000,000) was not postponable under any conditions. Also non-postponable in effect was the service on the German external loan of 1924, amounting to 61,800,000 marks a year. The latter portion of the annuities could therefore now be commercialized by the issue of bonds, to a total of about 12,600,000,000 marks (\$3,000,000,000); but only \$200,000,000 of these bonds were actually issued. Of the non-postponable portion of the annuities 500,000,000 marks a year or the equivalent in bonds was assigned to France. In the distribution of the total proceeds among the creditors the Spa percentages were modified, to the disadvantage of Great Britain, but at the first Hague conference the British share was increased somewhat. Deliveries in kind, hitherto the source of so much difficulty, were carefully regulated. A diminishing scale was established which provided for their complete disappearance after ten years. Indeed Great Britain refused to accept any payments at all in this form, preferring cash transfers and the Reparation (Recovery) Act levies on commodities such as would normally be imported from Germany.

The Young plan constituted an advance over the Dawes plan in certain important respects, particularly in that it set a definite amount and time for the German reparations obligation, in that it permitted the commercialization of at least a part of the payments and in that it gave Germany a burden to carry on its own responsibility, with little or no foreign supervision or assistance. Moreover the first charge on German government assets which the peace treaty had created was abolished in effect, if not in law, as was the priority given reparations over private payments abroad; the possibility that the creditor powers might once more resort to the treaty sanctions, in consequence of an asserted reparations default, seemed to have been permanently ended; and arbitral machinery was provided. The abolition of most of the previous transfer and other protections can perhaps be regarded as a fair price—as it was an inevitable one—for these gains. But in certain other directions the advance offered by the Young plan was less clear. There is little to show that those who framed it made any serious and impartial attempt to assess Germany's true, long run capacity to pay or even to take detailed account of its contemporary economic situation; chiefly they were trying only to obtain as much as possible above their own debts to the United States. The figures finally established were

reached by a process of sheer compromise reminiscent of the pre-Dawes plan era and had little standing on any other grounds. Indeed agreement on them was reached only at the very end of the Paris Conference, when it became clear that failure of the conference might precipitate an international financial crisis. Moreover subsequent events showed that one of the chief merits of the Young plan, its substitution of a fixed obligation for variable and protected payments, was also one of its chief defects.

Within two years of the ending of the Paris Conference the operation of the Young plan had been suspended, and at the end of another year the plan had in effect been abolished. This rapid change in the situation was not the direct consequence of anything inherent in the reparations problem as such, however, but was the product of that world depression and crisis which began in 1929 and reached such acute stages in 1931 and 1933. In these developments reparations were of course a contributing factor but they were not the chief cause, at least in any immediate sense. The crisis of 1931 was precipitated rather by the proposal for an Austro-German customs union made in the spring of that year and by the opposition of France. Austria collapsed; and Germany, subjected to severe withdrawals of funds, was compelled to adopt stringent emergency measures, including among others control of the foreign exchanges and the enforcement of standstill agreements on its short term obligations abroad. As one means to stem the crisis President Hoover thereupon proposed a year's moratorium, from June 30, 1931, on both reparations and the interallied debts. The moratorium was agreed to, but the end of the moratorium year found the world in an even more critical state. Many countries had been forced off the gold standard; world trade had shrunk steadily; and Germany, still forced to protect itself by standstill agreements, was in no position to resume reparations payments. In consequence a new conference composed of Germany and the principal reparations creditors was summoned at Lausanne to reconsider the reparations question, and reached an agreement July 9, 1932.

The Lausanne Agreement terminated the Young plan and the subsequent Hague Agreements. It substituted for the Young plan annuities a new set of obligations on a greatly reduced scale, themselves subject to cancellation under certain conditions. Germany was to deliver to the Bank for International Settlements

5 percent bonds for a total sum of 3,000,000,000 marks (\$714,000,000), which might be sold in the market and which were to be substituted for all previous obligations of Germany on reparations account except the Dawes and Young plan loans; but the bonds were not to be sold for three years from the signing of the agreement and any unsold after fifteen years were to be cancelled. Deliveries in kind disappeared, and allocation of the proceeds of the sale of bonds was left unsettled. But ratification of the Lausanne Agreement was not to be effected until the creditors had made satisfactory settlements with their own creditors—that is, with the United States on interallied debt account; and if such settlements were not obtained, the legal position was to revert to that existing before the Hoover moratorium. At the end of 1933 the situation was still completely in suspense. The United States had undertaken no definite steps looking to a reduction of the interallied debts to it, and the questions at issue, on the request of the United States, had even been debarred from the agenda of the World Economic Conference of 1933.

Such was the history of German reparations from 1918 to 1933. Until the end of 1923 the problem was handled as primarily a political and even a military issue, its treatment at first dominated by war hatreds, war blindness to current realities and the simple desire for vengeance; later, among certain of the creditor powers, urgent budgetary needs on the one hand, and the desire to insure military security by permanently crippling Germany through reparations exactions on the other, came to control their actions. But after 1923 wiser counsels prevailed. In the Dawes Committee proceedings economic fact was made the touchstone, and a reasonable current modus was worked out. With the Young plan an attempt was made to capitalize the economic progress of the preceding years, to transfer as much of the reparations problem as possible to the realm of private international finance and to establish a definitive settlement which should place reparations forever beyond the reach of politics. That the attempt failed was due in part perhaps to defects of the Young plan itself, but the chief immediate cause was the world depression, the causes of which lay for the most part quite outside the sphere of reparations as such. At the close of 1933 the whole question was once more unsettled.

The total payments made by Germany on reparations account cannot be established

definitely. The size of those made before the inauguration of the Dawes plan on September 1, 1924, are a matter of extreme disagreement. The Reparation Commission admitted payments for this period of only 10,426,000,000 gold marks, but its methods of valuation were debatable and its accounts incomplete. The German government claimed 42,059,000,000. Two independent unofficial estimates, one by Professor J. M. Keynes and the other by the Institute of Economics, later came to a fairly close agreement at about 26,000,000,000 marks (\$6,200,000,000) for the period prior to 1923, although this sum represents the estimated value to Germany of the payments, deliveries and cessions rather than the cash gain to the allied treasuries. The payments and receipts since the inauguration of the Dawes plan are, however, accurately known. Under the Dawes plan the sum actually paid by Germany and made available for distribution to the reparations creditors was 7,949,000,000 marks; under the Young plan, up to the cessation of payments under the Hoover moratorium, the amount was 2,871,900,000. In addition the creditors received the net proceeds of the Young plan loan, while Germany also met the service charges on this and the Dawes plan loan. The total payments by Germany on all these counts in the period from September 1, 1924, to June 30, 1931, amounted in round numbers to some 11,000,000,000 marks (\$2,600,000,000), and the actual reparations receipts of the creditors to a little more.

From their very inception the reparations charges on Germany have in fact been intimately associated with the sums owed by the creditors to one another and especially to the United States on interallied debt account (*see* LOANS, INTERGOVERNMENTAL). The connection was stressed as early as 1920 and was also the basis for the Balfour note of 1922 but it proved impossible to secure any formal arrangement to which all the governments concerned would agree—as is evidenced by the fruitless attempts of France and other continental debtors to make their payments to the United States contingent in whole or in part on their own reparations receipts. The association was emphasized still more strongly in the Young plan annuity and reduction arrangements; at the time of the Hoover moratorium the total payments scheduled to be made to the United States amounted to \$20,823,000,000, those to be made by Germany to \$25,610,000,000. As these figures suggest, the reparations creditors as a whole

have in point of fact made their net payments to the United States entirely out of reparations receipts, not from their own internal resources; and it is doubtful if the one set of payments could have been effected without the other. But the United States government has persistently refused to admit the connection either in law or in fact; and there, despite the further implications of the Lausanne Agreement, the matter still rests.

It is extremely difficult to estimate the aggregate real burden of the reparations payments and still more its distribution. The attempt to squeeze reparations from Germany was a major cause of that country's post-war inflation and collapse, but it is impossible to separate out the burden of reparations alone. For the more orderly period from 1924 to the 1931 moratorium a clearer picture can be obtained. In 1928-29 the reparations charges constituted 12.4 percent of the total cost of government in Germany and absorbed 3.4 percent of the estimated national income. This does not seem unbearably severe, and comparison with the tax burdens of other formerly belligerent European countries suggests that at that time Germany, although paying reparations, was really taxed but little more heavily than the principal receiving countries. Nor are there other evidences to show that reparations as such were then a source of dangerously severe internal strain in Germany; on the contrary, in 1928-29 the country was at or above the 1913 levels of production and general welfare.

But this is by no means the whole story. Two other major elements must be taken into account. First, the continuous effort to force German goods on foreign markets, which the transfer of reparations entailed, undoubtedly distorted world trade channels and depressed prices and living standards both in Germany and abroad. For the creditor powers there was an offset to this in that they were getting the goods free; but, since the commodities involved were largely in competition with their own products, the short run disturbance and depression felt by their own producers were frequently very substantial. It is impossible to isolate and to measure these adverse effects, but their reality is attested by the tariffs and other devices which the creditors set up to check the inflow of German goods.

Second, although from the internal point of view the necessary sums came exclusively from domestic taxation, from the point of view of

international finance Germany really made all its reparations payments by borrowing more than equivalent sums abroad, not by producing a true export surplus. From 1924 to 1930 Germany borrowed abroad some 18,000,000,000 marks net and 25,000,000,000 gross (\$4,300,000,000 and \$6,000,000,000, respectively), while its total reparations payments in this period were under 11,000,000,000. These borrowings made possible the phenomenal recovery after 1924, and gave Germany the internal strength as well as the external capacity with which to pay reparations. The fact that the borrowings exceeded the payments also meant, incidentally, that Germany was in point of fact never compelled to face that true transfer problem in connection with reparations about which economists have debated at such length. Since it was currently borrowing the necessary sums, in this period the pressure to make reparations payments did not force Germany to effect such internal readjustments as would increase its ordinary commodity exports—apart, that is, from deliveries in kind—relative to its imports. But the fact that as much as 40 percent of the money borrowed was obtained at short term actually placed Germany in an extremely precarious international financial position; how precarious was made only too clear in the summer of 1931. It would again be erroneous, however, to make reparations the sole villain in the piece; in recent years many other countries which were not reparations debtors have encountered analogous difficulties. Had the world depression not supervened, Germany could probably have rectified its position in due course—unless the view is adopted that reparations were the root cause of the depression itself.

It was undoubtedly defensible for the Allied Powers to demand reparations from Germany, war guilt quite apart, precisely as Germany demanded an indemnity of France in 1871. But it was defensible neither in terms of Germany's capacity to pay nor in terms of the creditors' self-interest to endeavor to exact reparations in the amounts and by the methods established in the earlier years. The enormous sums which modern international trade and finance make it possible to extract over a period of time from a defeated first class power can be obtained continuously only if the sums demanded are in reasonable relation to the debtor's economic and political capacity; only if the debtor itself, like the fabled goose with the golden eggs, is allowed to retain its economic and political health; and probably only if the payments, through bond

flotations or otherwise, are treated as economic rather than as political questions. Such seem to be the permanent lessons of the history of German reparations.

REPGOW, EIKE VON (c. 1180-c. 1250), German lay judge. Little information is available as to the story of Eike's life; the year of his birth and the year of his death may only be surmised. The home of his family was Repgow (or Rep-pichau) at Aken on the Elbe, near Magdeburg. Eike was a knight and vassal of Count Hoyer of Falkenstein. It is supposed that he passed the last years of his life in holy orders. In the conflict between the empire and the papacy he remained loyal to the empire. Eike's chief work is the *Sachsenspiegel*, a law book in which he recorded the ordinary and feudal law of his east

Saxon home; although originally composed in Latin, the book was translated by Eike himself into Low German. Even if it is not, as until recently supposed, the oldest German law book (the Mühlhäuser imperial law book is somewhat older), it is nevertheless the most important. Since Eike had almost no knowledge of the Roman law but knew the German law intimately as a result of his experience as a lay judge, his work, apart from some traces of the canon law, is purely Germanic in all its parts and the most valuable source of the German law of the Middle Ages. Despite the fact that it was only a private work the *Sachsenspiegel* achieved almost the force of law in lower Germany; it was considered "common" law in Saxony until the year 1865, in Thuringia until 1900, when the German Civil Code went into effect. In upper Germany it formed the basis of the *Schwabenspiegel* and the *Deutschenspiegel*, and it may therefore be said that the legal reasoning and idiom of the *Sachsenspiegel* constituted a model for the whole area of Germanic law. Besides a High German version it was translated into Dutch, Polish and Czech. In the east the *Sachsenspiegel* penetrated as far as the Ukraine. Of the many copies the four richly illuminated manuscripts dating from the fourteenth century are of great value for historical, aesthetic and archaeological reasons. Eike also wrote the first book of history in the German language, the Saxon world chronicle; this is not at all a mere learned compilation of older sources but an independent account marked by great discernment and keen judgment and intended especially for the educated layman of knightly rank.

REPRESENTATION. Any corporate group—church, business concern, trade union, fraternal order or state—that is too large or too dispersed in membership to conduct its deliberations in an assembly of all its members is confronted with a problem of representation, if it purports to act in any degree in accord with the opinions of its members. The idea of political representation is as old as the state. Almost universally, political rulers have been regarded as in some important aspects the spokesmen or agents of the people. Even during the most autocratic periods of Roman imperial rule authoritative jurists described the emperor as entitled to exercise his vast powers only in his capacity as representative of the Roman people. In the later Middle Ages this conception of representation appears in a general theory of the supremacy of the group, secular or ecclesiastical, over its corporative head. It is frequently asserted in writings from the eleventh to the fourteenth centuries that the state is not the prince but the whole community of citizens, and the church is not the pope or any other prelate but "the whole congregation of the faithful"; that the "group as a whole" therefore has in either case basic rights and interests which limit the legitimate powers of its rulers; and that the latter exercise their functions only as representatives of the corporate social body. Some of the writers ascribed specific powers of great practical significance to the group: certain writers contended that the general council of the church, in its capacity as representative of the whole congregation, had the right to determine the fundamental constitution and policy of the church and even to sit in judgment upon a criminal or heretical pope; others held that cardinals in choosing a pope acted as representatives of the entire ecclesiastical community, and that the princely electors in choosing the Holy Roman emperor represented the people of the empire.

There were no necessary democratic implications in this older idea of representation. The Roman jurists did not mean that the people should choose their emperor; and not all the mediaeval writers who spoke of pope, king or emperor as representative of and thereby limited

by the congregation of the faithful, the body politic of citizens or the whole folk of the empire held that the group in whose behalf the rulers were limited had properly anything to do with designating the ruler as their representative, with laying down the policies he was to follow or with defining and enforcing the limits to his authority. Various historians have cited isolated instances of an elective representation, actual or proposed, in ancient times. They point to the Athenian Council of the fifth century B.C., composed of 500 members chosen by lot from a list of candidates elected on a proportionate system by the hundred odd "peoples" (*demoi*) that made up the entire citizenry of the Athenian state. The cities composing the Achaean League were probably represented in such fashion in the assembly of the league. A Roman imperial rescript in the early fifth century A.D. proposed a scheme, never put into operation, to set up a Gallic parliament to be composed of deputies from the various districts and municipalities of Gaul. Generally, however, the principle of democracy appears in ancient times only in reference to a community small enough for its body of citizens to exercise their political functions directly.

There was a common theory among English and American historians of the nineteenth century that the modern system of elective representation is a development of a well established system of popular government that had existed among primitive Germanic communities as early as the fourth century, when assemblies including the male inhabitants of all ranks met periodically to decide important matters of public policy. The Anglo-Saxons, it was said, brought into Britain this system of direct democracy for their local village affairs and in time extended popular government a stage higher by having the village associations send their reeve and several others to represent them in shire and hundred courts. Thus by the time of the Norman Conquest there was already established the model for the system of national representation inaugurated in Simon de Montfort's Parliament of 1265 and Edward I's model Parliament of 1295. This "feutonic" theory of the origin of modern elective representation is now generally discarded. There is no evidence of a regular representation of the villages in the shire and hundred courts of Anglo-Saxon times or that the delegates, when they did appear, were elected or that they appeared to transmit to the central government any local community opinion on

governmental policy. In Norman times the king summoned knights of the shire to assist his itinerant judges in arranging for jury service or to aid the royal collectors in assessing taxes, and occasionally to come to Westminster to defend lawsuits involving their shire. Here again there are no signs of an appointment by election or of an assignment to any legislative function. Still other writers have held that the political representation which appeared in the thirteenth century was copied mainly from systems of ecclesiastical representation familiar at that time, particularly in the three great councils of the church and in the representative bodies of the orders of friars. As early as 1221 a constitution of the Dominican order provided for a central assembly to which the several provincial chapters should choose representatives empowered to take part in deliberations which, by majority vote, would bind the various chapters.

The modern system of political representation, a device for making popular control over national governmental policy in some measure practicable for communities too extensive for direct democracy, does not appear to be either a continuation of any ancient or early mediaeval institutions of popular government or a copy of ecclesiastical representative arrangements of the later Middle Ages. The system evolved gradually, without deliberate plan or imitation. The development is a phase in the evolution of the modern national state, associated essentially with the decay of the feudal order, the formation of political nationality, the rise of middle classes and a general movement from autocracy toward democracy.

Throughout most of the Middle Ages the only regular deliberative or consultative bodies in the central governments were the councils composed generally of greater vassals, higher ecclesiastics and royal officials, many of them serving only at the king's pleasure. In the later Middle Ages the monarchs began to consult other groups, notably the lower nobility or landed gentry (knights of the shire in England) and the townsmen. This was done, for example, in Castile in 1169, Languedoc in the early thirteenth century, England in 1264 and 1295, France in 1302 and the Netherlands, Sweden and Hungary in the fifteenth century. Since the gentry and townsmen could not assemble en masse, the representative device was employed. The representatives appeared, however, as spokesmen not of a whole nation or of a local segment of a consolidated people but of a hith-

erto unrecognized "estate of the realm." Thus the typical form of a central parliament in early modern times was an estates general, usually a meeting of three autonomous estates—nobility, clergy and townsmen. This form continued in France until 1789 and in other countries until the nineteenth century; it is still theoretically in operation in Hungary. In Sweden from the seventeenth century until 1866 there were four estates—nobility, clergy, burghers and peasants. In England, on the other hand, a bicameral system developed in the course of the fourteenth century, the high prelates merging with the nobility in a House of Lords and the landed gentry with the townsmen in a House of Commons. The summons for the English Parliament of 1295 called for election of the representatives of the knights and burgesses; the delegates of the third estate in France were elected from the beginning; and this process appears to have become regular in the other countries by the end of the fifteenth century. In all countries the chief occasion for the summoning of these bodies was the king's need for additional funds and the difficulty of raising them without the consent of the group that was to bear the burden of the tax. Through this control over the purse the new representative bodies gradually built up their legislative power.

This process, whereby a body representing a lower economic class, on a matter of assenting to a tax on that class, became a national representative body playing an active part in all legislation, stands out in clearest outline in England. In the course of the fourteenth century the knights' and commoners' representatives began to make their grant of aid conditional upon the redress of stated grievances. By the end of the next century the Parliament, composed of House of Lords and House of Commons, had become an established institution and the advice and consent of both bodies was regularly recognized as necessary in the enactment of legislation. In the succeeding century Parliament surrendered a vast discretionary authority to the Tudor monarchs; but the surrender appeared to be a voluntary concession of emergency powers to efficient and public spirited rulers who preserved generally a formal recognition of the Parliament's legislative function. During the seventeenth century, when the menace of foreign invasion had disappeared, the assertion, by the inefficient and doctrinaire Stuart kings, of a formal right to disregard Parliament brought forth the classic English statements—in petitions, statements

of grievances, statutory enactments, polemical pamphlets and philosophical treatises—of a permanent right, founded on both legal precedent and the essential nature of man and human society, of the people, through their chosen representatives, to control the form and policy of government. In some other countries, notably Sweden and the Netherlands, representative assemblies likewise obtained, during the sixteenth and seventeenth centuries, a regular part in the enactment of legislation. In most of the continental states, however, the significant development of representative government came only after the French Revolution. In general it may be said that bodies which, in the earlier stages of their existence, were not intended to represent any popular or national will or to take any part in the enactment of laws acquired gradually, in different periods and at different paces in the several countries, a legislative function and a democratic structure.

The literature of democracy, until very recent times, has contained relatively little discussion of the specific question of representation. A few mediaeval writers had considered the question chiefly in relation to the proper constitution of the church. In book II of the *Defensor pacis* (written in 1324) Marsilius of Padua proposed a system of representation to make it possible for the whole body of the Christian believers to exercise their rightful powers over church policy. The author sketched a plan for a general council, composed of representatives elected by regional groups of the faithful and apportioned among the regions according to the "number and quality" of the believers. William of Ockham a few decades later worked out a somewhat more detailed scheme, with representatives to the general council chosen by elective assemblies in the several provinces, dioceses and kingdoms, these assemblies being composed in turn of delegates elected by the faithful in the various parishes. Until the later nineteenth century most of the advocates of democracy assumed, without any specification of details of the structure that the people, grouped regionally, would exercise their political powers by choosing persons to speak for them in constituent and legislative assemblies. Rousseau in the later eighteenth century repudiated altogether the representative principle, which he held to be inconsistent with popular sovereignty. The people, he said, may properly select agents to discharge tasks of execution, clearly specified in direct expressions of the general will; they cannot depute to their

agents the function of formulating that will. Whether the representatives exercise their own judgment as to what the general interest demands or attempt to execute literally an imperative popular mandate, they actually and inevitably come to conclusions essentially different from what the people would decide directly. Since no one can actually represent the will of another, the general will of the people can be reliably expressed only in primary assemblies. Sieyès a few years later held that in large states the formulations of the general will, on matters of both constitutional and legislative policy, may safely and must be entrusted to assemblies of elected representatives. This has been generally assumed in the modern democratic theory. Something of Rousseau's idea appears, however, in the requirement, which obtains in Switzerland, Latin America and the commonwealths of the United States, for direct popular ratification of constitutional changes as well as in the initiative and referendum (*q.v.*) for ordinary legislation.

The democracy of the modern world is generally representative democracy. Pure democracy, in which the politically qualified members of the community meet together to discuss and decide public questions, is suitable only for small communities with simple collective needs; it has never widely existed and functions now only in a very few places (*see* POPULAR ASSEMBLIES). The initiative and referendum can, even under the most favorable conditions, be employed for relatively few questions. Furthermore they provide no opportunity for the essential function of deliberation. The most fundamental problem in organizing modern democracy is that of securing a system of selection which insures the choice of representatives who reflect as completely as possible the varieties of interests and opinions among the people.

Some modern writers have denied that popular election is necessary or at all adequate as a means of securing a representation of the popular will. They have set forth the merits of a virtual as contrasted with a literal representation of the people. They attack the prevailing democratic theory, not by controverting its basic creed that a government should serve the constant needs and obey the ultimate and enduring opinions of the people, but by challenging the democratic hypothesis that popular election secures a faithful reflection of those needs and opinions. They acknowledge that there should be a communion of interests and a basic agreement be-

tween governing and governed but deny that indiscriminating popular election secures these. The democratic system, they say, tends to select the man who has the capacity and disposition for discovering only the manifest and transitory popular opinion; either he does not understand the real or rational will of the people or he feels impelled, by the conditions of his official tenure, to contravene what he knows to be the ultimate popular will and follow instead its rapidly varying impulsive and inexperienced expressions. The true representative obeys the people by doing the things he knows they would want done if they possessed his knowledge, insight and experience—as a physician, when he prescribes things disliked and opposed by his patient, nevertheless represents the patient's real will to get well. This was generally the idea of Hegel, when he spoke of the sovereignty of a general will realized through a government by kings and nobles, and of Burke and Disraeli, when they argued for the truly representative position of a hereditary House of Lords and of a House of Commons chosen only by the landed gentry.

The constitutional systems of certain European dictatorships carry to an extreme this idea of a representation of a national popular will secured through a system of selection which accords only a minor part to popular choice. In both Fascist Italy and National Socialist Germany the entire country constitutes a single electoral district. The function of the electorate is confined to passing upon a single complete slate of representatives prepared by the central organizations of the dictatorial parties, in the case of Italy on the basis of nominations made by the national economic and professional confederations (*see* GOVERNMENT, section on ITALY). Popular approval is assured both by the governmental control over the agencies of public opinion and by the clear assurance that in any event no representatives not fully approved by the government can be chosen. No attempt is made to secure any real popular representation. The schemes function essentially as parts of generally hierarchic and absolutist political regimes. The Austrian constitution adopted in 1934 went even further in the same direction and completely abolished the elective parliament, substituting five appointed bodies with advisory powers only.

The typical democratic doctrine is that popular election serves at least as well as any other system in securing representative leaders and serves better than any other system in confining

the latter to their function of leadership. The doctrine holds, on the one hand, that the rank and file are generally competent to make a relatively intelligent discrimination between candidates who intend to further the public interest and others motivated by individual or group self-interest; and, on the other hand, that no individual is ever so superior in wisdom and self-control that he does not constantly need both the enlightenment and the restraint which come from the necessity of persuading the minds and wills and maintaining the confidence and respect of the masses whom he seeks to lead.

Even among those who insist upon election as essential to representation opinions differ as to the nature of the representative's responsibility to his constituents. Should he decide matters only according to his own judgment or should he obey literally the wishes of his constituents? In forming his independent judgment should he take into consideration the interests of his particular locality or of the people of the entire nation? There are historic instances of representatives bound by the instructions of their constituents. This was the case in the Cortes of mediaeval Spain and in the Netherlands from the fifteenth century until 1814. On the other hand, the French revolutionary assembly of 1789 proclaimed that its members, representing the entire nation, could not be bound by instructions from their particular constituencies; and a similar principle of free representation was embodied in the mid-nineteenth century constitutions of France, Prussia and Italy. Most later constitutions are silent on the issue. It is sometimes contended that the usual requirement, as in the United States and France, that the representative must reside in the district he represents encourages a narrow localism in his point of view. In England there is no such requirement of residence, although the representative is expected to maintain special contacts with the people of his district.

This problem is not capable of precise solution by either a legal requirement or a rule of practise. Students of politics incline generally toward a somewhat intermediate position. A representative, they say, ought to make his final decision according to his own judgment rather than in submission to the indicated views of either his particular constituency or the people of the entire nation; he should form his judgment with a view to the interest of the whole nation rather than that of his constituency; but he has a peculiar responsibility to see that the

opinions and interests of his particular constituency are given due weight in the general deliberations on legislation intended to meet the needs and desires of a consolidated people.

The most variously debated issues in the recent discussions of the organization of democratic representation relate to the proper grouping of the people for purposes of representation and to the possible devices for securing a somewhat proportionate representation for the several fractions, minority as well as majority, within the several basic representative groups.

The traditional and still prevailing system of voting for representatives is by territorial groups. Although in the early parliaments of modern European states the several estates—nobility, clergy, commoners—were represented in separate houses, the commoners' representatives were always chosen from territorial districts. There was no explicit theory behind the first appearance of this system. It was simply the most natural and convenient method of grouping the large body of common people. The later theoretical justification rests upon the assumption that interests within any given region are fundamentally unified and that they vary from region to region.

The assumption has been widely challenged in recent years. It is argued that the traditional system of representation falls needlessly short of the democratic ideal of government in two ways: it represents the voters in groups that are rarely homogeneous in political needs and opinions; and it represents only majority or plurality fractions of the several groups, leaving substantial minorities without any voice in government.

To remedy the first and more fundamental defect many publicists have advocated recently a radically different grouping of voters for purposes of representation. They contend that a territorial district embraces such various, often conflicting, economic and social needs and views that no clear mandate to the chosen delegate can be fused out of them; consequently what he represents is only one or several minority groups; or no group is represented, the persons chosen being those who are facile in the elaboration of principles so vague as to avoid offense to any group. Some critics have proposed the explicit representation of economic or occupational groups (*see* FUNCTIONAL REPRESENTATION). People engaged in the same kind of work or owning the same kind of property have, it is said, more in common than people living in the same district. Moreover the chief political issues are

economic issues, and each economic group has certain specific rights or interests upon which its members are peculiarly informed. The specific proposals are generally somewhat vague in defining the composition of the groups, in fixing the distribution of representation among them and in arranging the interrelations of the occupational bodies among themselves and with the territorially representative bodies, if these latter are to be retained.

Critics of the plan of representation on the basis of economic or occupational groups point out that such groups are indefinite and impermanent in their composition. Many essential occupations form no distinct interests in relation to fundamental political questions. It is difficult both to define the groups and to distribute individuals among them properly. Even where groupings fairly definite and stable in composition can be identified, their interdependence makes it fallacious to regard their real political interests as either conflicting or separable. Basic interests in the way of safety, order and health are common to all groups; where these interests vary in the specific requirements for their protection, the variations generally follow territorial rather than vocational lines. Finally, vocational interest is not the only and not always the chief determinant of social alignment; racial, religious and sectional features also serve to unite or differentiate citizens, emotionally and practically.

Contemporary opinion generally looks with more favor upon proposals for minority and proportional representation, for the latter systems retain the territorial constituencies, which do correspond to actual unities of interest, but remedy in some measure the inadequacies of territorial representation. They permit political groupings on occupational or other lines but do not require any legal definition of the groups. By distributing votes rather than voters they secure an alignment on the basis of any consideration that is actually dominant in the minds of the voters when they mark their ballots. The schemes in varying forms are in operation for the election of national parliaments in a dozen or more European states and of the councils of a number of cities in the United States, Canada, South Africa and several European countries (*see* PROPORTIONAL REPRESENTATION). The obstacles to the further extension of the systems of proportional and minority representation have been chiefly of a practical sort. They have been criticized as mysteriously complicated, dependent upon highly centralized party disciplines or

conducive to an excessive number of parties, which necessitates cumbersome and uncertain compromises among blocs and factions in the legislature. These objections together with the superficial simplicity of the territorial system, the force of inertia behind the latter and the consideration that the underrepresentation of certain minorities in some districts may be offset by an overrepresentation in other districts are chiefly responsible for the fact that the older system is retained in most countries, despite the demonstrable evidence that many of the objections to the newer systems have not been supported by actual experience.

In some countries with bicameral legislatures the composition of the smaller or upper chamber affords extra representation to select cultural, professional or economic groups. There is, however, no agreement as to the proper way to constitute an upper house so as to make it really a reflection of the more competent political opinion of a nation. Writers generally acknowledge that accession by birth no longer supplies a valid basis, if it ever did. They have more confidence in the possibilities of either executive appointment from special categories—men of experience in high offices of state or church or of distinguished achievement in science, literature, art, invention or business—or indirect election of members having special qualifications and serving for long terms of office.

For certain countries that are chronically disturbed by sharp racial or religious conflicts special consideration has been given to the problem of affording representation for the apparently irreconcilable or unassimilable factions in the population. Thus under systems of communal representation, such as that adopted for Palestine in 1922 but never put into operation and that proposed for India in the constitution of 1919, representation is arranged so as to give each rival group adequate protection. No effort is made to apportion representation according to population, and the scheme appears as a system of deliberately created estates.

The advocates of guild socialism proposed a combination of functional representation with a limited application of the territorial system to provide representation for common consumers' interests. In general pluralists, guild socialists and various proponents of national economic councils agree that the essential principle of democracy demands more than a popularization of the structure of formal government. They propose to recognize the political importance of

occupational groups by devolving important social functions upon them. The modern state, they maintain, is made up essentially of groups rather than individuals, and the latter can be organically linked with the community only through the various intermediate associations into which any individual's more immediate interests naturally draw him.

Even these advocates of group autonomies recognize, however, that there are general as well as special interests within the community and that the special interests have to be directed into many carefully contrived coordinations and compromises. They generally agree also that a national state is the proper agency of these adjustments and that it successfully discharges this function of integration only if it is constituted so as to represent the community as a whole. The problem of a general political representation therefore still has to be solved.

James Mill, in his famous article on "Government," written in 1814 for the *Encyclopædia Britannica*, called representation "the grand discovery of modern times," supplying the key to "the solution of all the difficulties, both spiritual and practical," in the way of organizing "good Government." Political scientists have yet to find the solution for the difficulties in the way of organizing good representation.

REPRESENTATIVES, HOUSE OF. See LEGISLATIVE ASSEMBLIES.

REPRISALS. The word reprisal has been used loosely to describe a variety of practises. In the technical language of modern international law a reprisal is any forcible action by a state in time of peace, involving taking possession of the property or the territory of another state or of its citizens to be held as a pledge or in lieu of compensation, in order to satisfy a claim based upon an unlawful act of such other state or its citizens. It thus affords a legal foundation for acts which would otherwise be illegal. In its common but inaccurate use it connotes and is applied frequently to measures of "retaliation" (the return of like for like) or "retorsion" (any action by one state in response to the disapproved act of another state whether for compensation or to deter future acts of a similar nature).

The term has no equivalent in classical Latin, although it appears in Middle Latin in a form akin to the French, Spanish and Italian variations. The later practise of reprisals, as Grotius noted, was foreshadowed in the Athenian custom called *androlepsia*, whereby the relatives of an Athenian murdered by a foreigner might seize three fellow citizens of the murderer in order to secure compensation or to impose upon them the death penalty. Similar customs prevailed among other ancient peoples and were one manifestation of a principle, prevalent in

Europe through the early Middle Ages, whereby the group and each of its members were held responsible for the wrongs of any one member. With the gradual emergence of the modern state reprisals became a form of international redress short of war.

In their fully developed form reprisals were used to secure private indemnification rather than to inflict injury upon a public enemy. As a legitimate means of quasi-judicial execution this form of redress, regulated by the king but executed by the injured private citizen, appears well developed at the end of the thirteenth century. It consisted in taking property from aliens to satisfy claims arising usually from the unlawful acts of fellow citizens of the persons against whom the reprisal was executed. Although there were exceptions, letters of reprisal were generally not issued unless the petitioner proved a claim for a sum certain arising from an unlawful act; after the fourteenth century reprisals were rarely authorized merely for the collection of a commercial debt. The claimant also was required to show unsuccessful attempts to secure redress through judicial or diplomatic channels (*déni de justice*). The letters issued by proper state authority usually confined seizures to the goods of a specified body or group of persons and to an amount sufficient to satisfy the claim plus costs. After seizures had been made, the holder of the letters had to give an accounting to state authorities and any excess value was returned to the owners. Some letters of reprisal were directed against the inhabitants as well as the citizens of the wrongdoer's country. On the other hand, it appears that letters were at times given by a king to aliens who invoked his assistance against other aliens, although this practise called forth vigorous protests. Private reprisals were not considered acts of war although their abuse sometimes led to counter reprisals, or letters of *contremarque*. In early documents the word *marque* is frequently used in conjunction with or in substitution for reprisal. By the seventeenth century, however, letters of *marque* commonly refer to the authorization given privateers to operate against an enemy in time of war. Private reprisals gradually disappeared as the central authority of states grew stronger and by 1800 the practise was substantially at an end.

Public reprisals executed by state authorities in satisfaction of a public claim were also practised from an early time. In general they followed the forms and requirements for private

reprisals. In the middle of the seventeenth century the English admiralty judges advised the Council of State that the right of public reprisals was soundly based in law and practise. A *cause célèbre* in the middle of the eighteenth century was the action of Frederick the Great in withholding payments on the Silesian loan due to British subjects because of alleged unlawful interferences by the British with Prussian merchantmen (Satow, E. M., *The Silesian Loan and Frederick the Great*, Oxford 1915). Reprisals in the form of seizures of vessels, customhouses, ports or territory have been frequent in modern history. Between two major powers of equal strength such a step is usually a prelude to or the signal for the outbreak of war. As practised by a strong against a weak state, it is usually a measure short of war designed to compel compliance with some demand for compensation for private citizens or for satisfaction for some public wrong. It has not infrequently been used by a strong state as a pretext for advancing imperialistic aims, as have also acts of retorsion and retaliation. The last named term is the one commonly used to designate non-forcible measures, such as tariff increases, embargoes and the like, when used by a state in response to some unfriendly act of another state.

Unquestionably the use of forcible reprisals is not regarded favorably in modern times. Nevertheless, it is argued that any such measure is preferable to war itself. The difficulty with this argument is that between states of more or less equal power the use of reprisals is an almost certain prelude to war. Where forcible action is taken by a strong state against a weak state, it makes little difference whether or not war be declared, as was well exemplified in the three-power blockade of Venezuela in 1902, which was begun as a pacific blockade but changed to a belligerent blockade in order to meet protests by the United States regarding the effect of a pacific blockade upon vessels of the United States.

There are at present certain conventional restrictions upon the use of reprisals. The Hague Convention of 1907 respecting the Limitation of the Employment of Force for the Recovery of Contract Debts limited the sphere in which these various measures of self-help might lawfully be utilized. Further limitations were introduced by the provisions of the Covenant of the League of Nations. Probably the provision in article 10, requiring League members to respect the territorial integrity of their fellow members

against "external aggression," does not exclude the use of reprisals or retorsion, since such measures are frequently accompanied by a denial of any design upon the territory or sovereignty of the state affected. The general obligations for pacific settlement as embodied in article 12 of the Covenant and in the Briand-Kellogg pact should limit the use of force by way of reprisal, retaliation or retorsion. However, the Corfu incident in 1923 indicates that the provisions of the Covenant are ambiguous. On that occasion the Italians bombarded and occupied the Greek island of Corfu to bring pressure upon the Greek government to comply with the Italian ultimatum demanding apology and reparation for the murder of the Italian members of the Greco-Albanian Frontier Commission. The Committee of Jurists appointed by the Council of the League to report whether such coercive measures were permissible under the Covenant concluded rather enigmatically that such measures short of war "may or may not be compatible" with the Covenant depending upon the circumstances of each case [League of Nations, *Official Journal*, 4th year (1923) 1276-82, 1412-14; 5th year (1924) 523-27]. President Roosevelt's declaration to the heads of the governments of the world on May 16, 1933, in which he suggested an agreement that any state should be deemed an aggressor which sent an armed force of whatsoever nature across its frontiers, would probably, if adopted, eliminate the use of many of these measures of self-help.

Irrespective of the exact legal interpretation of these various documents there is evident a tendency to supplant individual measures of self-help by the joint action of the international community. The dawn of such a system represents an extraordinarily interesting step in the development of a legal institution. The use of private reprisals whereby the individual resorted to force under authority of his king in order to collect damages gave way to a period in which the state itself employed force to collect damages or to secure atonement for an injury; this has led finally to the suggestion that such processes should be undertaken only by the international community as a whole.

The use of public reprisals, *stricto sensu*, against a public enemy in time of war is not unknown, but most of the cases frequently placed under this head should be classified as retorsion or retaliation. In land warfare the use of an otherwise illegal method or instrument

against the enemy in return for his previous use thereof is supportable in law but usually has little military justification because of the vicious circle of atrocities which it is likely to introduce. To strike back "through the sides" of a neutral, however, at an enemy who has violated neutral rights is of dubious validity. It has often been attempted ever since the seventeenth century, particularly in the Napoleonic and World wars despite neutral protests. The English Orders in Council and Napoleonic decrees all purported to be responses to prior illegal acts of the enemy. Closely identical situations developed during the World War when the use of submarines, mines and other interferences with neutral commerce were justified on the ground that they were a response to prior unlawful acts of the enemy. Although it has been maintained that neutrals are protected by the prize courts against the improper use of reprisals, the remedy seems to be illusory, even in England, since the court will not go behind an affirmation by the crown regarding the action of the enemy which is advanced as legal justification for the retaliatory acts.

REPUBLICAN PARTY, UNITED STATES.

See PARTIES, POLITICAL, section on UNITED STATES.

REPUBLICANISM The concept of republicanism in the western world is bound up inextricably with the Greek and Roman republics. For centuries the tradition of the struggles of the Greek city-states for freedom, on the one hand

against their tyrants and on the other against the oriental despotism of the Persian kings, kept the republican idea alive. In an age when Latin was the language of all cultured people, the example of the Romans had even greater effect: their legendary conflict with a kingship which finally degenerated into tyranny; their heroic devotion to the *salus publica*; their desperate attempt to stave off Caesarism. Even the period of complete absolutism did not succeed in obliterating the republican idea.

The interest of the mediaeval political theorist in Rome, however, was far more in the *imperium*, the combination of emperors with world domination, persisting at least as a theoretical claim among the German emperors of the Middle Ages. The mediaeval doctrine of the state was inherently monarchic. The thesis of a natural right of resistance was not strong enough seriously to endanger the fundamental mediaeval conception of "one flock and one shepherd," even for political theorists who, like Marsilius of Padua, based the authority of the state upon popular sovereignty and conceived of the ruler as the mandatary of the ruled. Political thought in this epoch centered not in the opposition between monarchy and republic but in that between *sacerdotium* and *imperium*. Even though Dante's *Divine Comedy* consigned Caesar's murderers to the deepest abyss of hell, monarchic and republican elements could exist peacefully side by side in the mediaeval state.

Only the break up of mediaeval universalism opened the way for a republicanism which, like that of the ancient world, bore distinctly anti-monarchic features. Characteristically it was in the Italian city-states that the ancient tradition was reborn. The struggle which the Florentine republicans carried on against the Medici is a case in point. It is true that the final results were negative. For from the ruins of mediaeval universalism there arose a number of powerful monarchies, to whose rivalry the majority of the Italian city republics soon fell prey. Nevertheless, the republican interlude remains of interest because it was accompanied by a literary movement. The chief spokesmen of the republican ideology were the humanists, who reversed the mediaeval valuation of Caesar and his opponents: to them Caesar appeared as a tyrant, Brutus and Cassius as the great heroes of freedom. Even the great realist Machiavelli was unable entirely to shake off this attitude. His reason told him that Italy needed a ruler who would force it to unite, but his heart was with

the republic. Most of the humanists, however, disregarding political reality, espoused a republicanism which did not shrink even from the demand for tyrannicide.

The Reformation was far more important for the revival of the republican ideology than the Renaissance. Luther, in accordance with his purely religious position, disregarded the question of state form and recommended passive obedience to his followers. But in addition to Zwingli, a republican both because he was a Swiss and because he was a humanist, Calvin and the radical Protestant sects, such as the Anabaptists, were essentially republicans. The determining factor was not the fact that Calvin by both birth and training belonged to the Roman tradition or that by accident the city-state of Geneva became the focal point of his campaign, but the thoroughly activist character of Calvinism itself. The Calvinist wanted to reform the world; even in his political activity he fought "for the greater glory of God."

Calvin himself cannot be characterized unconditionally as a republican. Although he accepted the right of opposition by subjects, he held that this right should be exercised not by the people as such but by their corporative organs. Whenever Calvinism encountered governmental opposition, however, the limits he set up were soon forgotten. Thus Theodore Beza in France and John Knox in Scotland went almost so far as to subscribe to unqualified popular sovereignty, with all its implications, such as the contract character of the state and the right of the people to revolt. In their contract theory the Calvinistic monarchomachs agreed with the Jesuits Suarez and Mariana. Both parties sought by means of this theory to weaken the state as opposed to the church. For the state, they taught, rests only on a human compact while the church is supported by divine manifestation. From this it followed that the true Christian might take up arms against a heretical ruler. The Calvinist and Jesuit monarchomachs differed as to what constituted true belief; they agreed only that the heretical ruler was to be considered a tyrant.

These confessional antimonarchic doctrines, which led up to tyrannicide in France and in England, resulted in the establishment of actual republics in only two great powers, the Netherlands and England. In both cases the republic was of short duration. In the aristocratic republic of Holland the States General, which represented only the patricians, consistently in time

of danger had to give way to the stadholdership of the House of Orange, which had far more support among the masses. In England the Commonwealth, subsisting only in the form of a protectorate whose chief support was the Ironsides of Cromwell, disappeared shortly after the death of the Lord Protector. Neither of these republics, whose ideology would be incomprehensible without the confessional element, had any appreciable influence upon the development on the continent, where absolute monarchy steadily advanced. Numerous republican strains, however, may be traced from the English Puritans to the American Declaration of Independence of 1776, which heralded the establishment of the first powerful and enduring republic since the ancient world.

Of course the Declaration, like the Constitution of the United States, was based as much on philosophic as on religious ideas. The conception that man possesses certain inalienable rights would be inconceivable without the philosophy of the eighteenth century. Most of the eighteenth century philosophers did not concern themselves about the question of the form of the state beyond advocating a utopian rule of reason which implied rule by the philosophers themselves. They demanded only freedom of thought but differed widely as to how this could best be assured. Locke had already urged that the best protection to individual freedom lay in the limited monarchy. His French pupil Montesquieu was in agreement on this point, although he conceded the theoretical moral superiority of the republic because it rests on the *virtus*, the patriotism of the citizens. Montesquieu too regarded the Romans as the original republican type. It was because he had no confidence in the Roman virtue of his contemporaries that he advised them to content themselves with the limited monarchy, which appealed only to the "prejudice" of honor. Other philosophers of the eighteenth century were even more resigned. Voltaire, with all his high esteem of republicanism and Rome in theory, contented himself in practise with enlightened despotism. His admiration of the *encyclopedistes* for the enlightened monarchy is significant. To the philosopher the primary thing is progress; he is not essentially concerned with the means whereby this progress is to be achieved.

What bound the people of the Enlightenment together despite all divergences was the love of mankind, the affirmation of the preeminent value of the human being. This diffuse human-

ism, without which the ideas of 1789 are inconceivable, does not, however, lead to democracy. For the philosopher of the eighteenth century was no patriot; he was a citizen of the world, and his preoccupation was not with a particular nation but with mankind as a whole. The republican-democratic element, as it first emerged in Europe in the French Revolution, had its roots elsewhere, in the doctrine of Rousseau. Rousseau felt himself in the first place a citizen of Geneva; and his experiences in that city-state together with lessons derived from ancient history gave rise to his feeling of strangeness in the French society of the expiring *ancien régime*. Rousseau's fundamental thesis is that society distorts man. But since man cannot return to a state of nature, only one choice lies open to him: he must turn all his efforts toward the achievement of complete democracy.

Rousseau is still realist enough to appreciate the fundamental difference between ancient and modern democracy, something which the humanists never clearly grasped. Ancient democracy rested on slavery. Modern democracy, on the other hand, stands or falls on the question of how the modern gainfully employed man can function as a citizen. Thus Rousseau arrives at the antithesis between the bourgeois and the citizen. The former belongs to the *volonté particulière*; he attends to his own affairs and works for himself. He did this in the state of nature and he continues to do so after the establishment of the community. But as a private person man is not a political being. He becomes such only when he appears in the forum to take a stand on questions affecting the community. It is at this point, according to the democratic doctrine, that he should forget his existence as a private individual and identify himself with the will of the people and the demands of the common weal. Rousseau's theory is thus entirely oriented on the city-state, where the people actually assemble in the market place. His democracy is direct democracy; the representative system is completely disregarded. Rousseau's citizens elect officials, but these may be recalled at any time. For the *volonté générale* is inalienable; the people remains sovereign, the final legal resort even when temporarily it entrusts one of its members with the exercise of its sovereignty. Thus democracy leads logically to the republic, for if there is no room for a representative in Rousseau's city-state, there can certainly be no justification for a monarch with hereditary functions.

Nothing was further from the thoughts of the men of 1789 than to make France a republic. The Constituent Assembly sought only to limit the power of the king by means of a constitution, or, in Mably's phrase, to set up a *monarchie républicaine*. Only when Louis XVI sided with the privileged classes, the nobility and the clergy, against the third estate and threatened to treat with foreign nations in order to effect a counter-revolution did the revolution turn against the monarchy and abolish the kingship in France. And the more the Convention entangled itself in the struggle with the other European powers, the wider became the rift between monarchists and republicans, until the Jacobin Terror made the concept patriot synonymous with republican. The nineteenth century, by excluding all intermediate forms, such as the parliamentary monarchy of Louis Philippe and the democratic Caesarism of Napoleon III, intensified the differences, until for the French masses also the question of what form the state should take finally became a matter of choice between republicanism and absolutism. This antithetic attitude, however, did not spread to other western nations, although the "ideas of 1789" claimed universal validity. In the United States the lack of alternative was due to the absence of the monarch. As soon as British rule was shaken off, the republic became self-evident; and the few loyalists were far too weak to threaten it seriously. Similarly all the South American states except Brazil set up republics as soon as they achieved independence. On the other hand, England had progressed in the direction of democracy without destroying the monarchic frame. Toward the end of the Victorian era certain radicals, like Dilke and the elder Chamberlain, theoretically advocated republicanism; but once they achieved power, they changed their attitude. In the middle European states the opposition of the multiplicity of dynasties to both democracy and national unity should have favored the spread of republicanism. But here the inability of the democrats of 1848, who were only in part republican, to achieve unity vorked against republicanism; when Italian unity was made possible by Piedmontese monarchy and German unity by Prussian monarchy, the liberal bourgeoisie, most outspoken in their advocacy of national unity, very quickly came to terms with the *fait accompli*.

Behind the struggles concerning the form of the state there were also of course social conflicts, but these did not become crystallized until the

rise of socialism. It is true that socialism did not from the first take a unified position toward the problem of state form. English socialism did not attack the frame of the parliamentary monarchy. Even the Chartists sought only an extension of the franchise, and to this day leaders of the Labour party have accommodated themselves to court forms. The attitude of the French socialists was divided. Saint-Simon took no interest in the question of state form. He sought to replace "government over persons" by "administration of things." Louis Blanc, going back to Babeuf, again made French socialism political, teaching that political democracy is a prerequisite to a social revolution. Since 1848, when the proletariat demanded the establishment of the republic, the French working class has held obdurately to the republican ideology. The attitude of the German socialists too was uncertain. Lassalle could still think of a social monarchy which should combine with the working class against bourgeois liberalism. Karl Marx, undoubtedly under the influence of the French example, first oriented German Social Democracy toward the republican side, with the argument that socialism can attain its goal only if it at first fights shoulder to shoulder with the most radical elements of the bourgeoisie. Bismarck's socialist laws sharpened the antimonarchic attitude of the German Social Democrats, but the question of state form never became acute in Germany before the World War.

The war once again brought the problem to the fore. The western European democracies and the United States, although they were allied with Russian czarism, claimed to be fighting for national freedom and the right of national self-determination. The Hapsburg monarchy dissolved into a series of republics which, like their predecessor, were not national but nationality states. The German Reich also became a republic in 1918. The Soviet Union, on the other hand, found the republic already at hand and placed far less emphasis upon its republican than upon its proletarian character. War and revolution transformed most of the states of Europe into republics. But the very victory of republicanism introduced a new phase of the problem. If Ranke characterized the political history of the nineteenth century as the struggle between the divine right of kings and popular sovereignty, then the World War indeed brought that century to a close. For even the monarchist no longer seeks to justify monarchy with transcendental arguments. No one any longer denies

that the popular will is the legal base of all politics. Republican sentiment has thereby, however, lost both its opponents and its significance. To the post-war generation the choice between monarchy or republic resolves itself into the question as to which is more opportune. Italian Fascism, for example, which in its first phase was still republican, has easily compromised with the existence of the monarchy, while German National Socialism is vigorous in its attacks upon monarchist propaganda. What is now debated is no longer the idea of democracy, but how it is to be realized. In place of the antithesis between monarchy and republic has appeared that between parliamentary and authoritarian democracy.

REPUDIATION OF PUBLIC DEBTS includes the voidance by a state of its obligations toward its creditors by unilateral action, and refusal to admit the validity of a presumed obligation. It may be complete, partial or concealed. Complete repudiation is a legislative act whereby the state refuses explicitly to recognize an outstanding obligation. Partial repudiation is a unilateral modification by the debtor of any material term of the loan contract. Concealed repudiation is an indirect scaling down or voidance of the debt or of the interest payments on it by monetary depreciation or by the imposition of a special tax on coupons or by some other action. Repudiation should be distinguished from default, which may be defined as any deviation from the terms of the loan contract

without denial of the validity of the contract and which implies simply an inability to carry out its terms. In some cases, however, the default takes the form of repudiation and the distinction between the two disappears. Repudiation must be distinguished also from the non-assumption of a debt by a successor state, particularly when it succeeds to the territory or part of the territory of another state. In such cases the extent of the obligation descending on the successor state is not clearly established, so that it is difficult to determine whether or not the refusal of the successor state to assume this or that debt or share of debt constitutes repudiation. While most writers are too prone to apply to public debts the principles of private law and to treat repudiation as state bankruptcy, repudiation does not always involve inability to pay as implied in insolvency and is not infrequently motivated by major considerations of a political and social nature.

Repudiation is an act of sovereignty which can be exercised only by an authority possessing sovereignty. The device is as old as is the practise of public borrowing. It was resorted to in antiquity, usually following a war, and became especially prevalent under feudalism; one of its earliest and most frequent forms was the debasement of coinage. Since the debts of the feudal lords had a private or personal character and were incurred from professional money lenders at usurious rates of interest, the non-payment of a debt was not looked upon as a contemptible deed, especially in view of the general prohibition of usury by the church. With the establishment of national states and the separation of public property from royal private property, debts contracted by the government assumed a public character. Loans were now obtained by popular subscription and the non-payment of a debt came to be regarded as dishonorable. Outright repudiations became more rare and governments which were unable or unwilling fully to meet the terms of the lending agreement began to resort to concealed or partial repudiation in the form of compulsory conversion of a high interest bearing debt into a low interest bearing one or of payment of a debt in paper assignats instead of in coin.

As the sanctity of contracts constitutes a cardinal principle of capitalistic society, complete repudiations became still more rare during the era of capitalism and constitutionalism. There have been altogether fewer than a dozen cases of complete repudiation during the past 130 years. One took place in Spain in 1823 and

another in Portugal in 1832. In both cases the debts eventually were recognized because of pressure from the creditor states. More important was the repudiation by Juárez in 1867, following his overthrow of Emperor Maximilian of Mexico, of the loans raised by the latter in France with the active assistance of the French government, which sought to promote the French adventure in Mexico. In the 1840's and again the 1870's and 1880's several states of the United States either repudiated some of their debts outright, as did Mississippi and Florida, or else, like Alabama and others, defaulted. Although some of these repudiations had a legal foundation in that some of the bonds had been issued in an irregular manner, the main considerations were political and social, growing out of a revolt of taxpayers against acts of corrupt and irresponsible government. In 1868 the United States declared, in an amendment to its constitution, that all debts contracted by the southern states during the rebellion and any debts that might be incurred at any time in aid of an insurrection against the United States were illegal and void. A question may be raised as to whether this act was a repudiation, but its propriety has never been questioned. The most colossal repudiation, however, was that pronounced by Soviet Russia in 1918, involving over \$19,000,000,000 of government and government guaranteed debts. The act of repudiation at first allowed for some exceptions in the case of domestic debt but was later extended to include all debts. The general debts were repudiated on the ground that they had been "contracted by the government of Russian landowners and Russian bourgeoisie" and were a part of the capitalistic system of private property rights repugnant to the new socialist order; while the debts to the allied governments were repudiated on the special ground that they had been incurred for the financing of a war in which these governments had much more at stake than had Russia.

Partial or concealed repudiations have been resorted to since the dawn of the nineteenth century by almost every country in the world. They have taken several forms, the requisite action being unilateral in every case: reduction in the rate of interest, a procedure followed repeatedly in Spain and Colombia and as late as 1933 in Argentina; postponement of the date of repayment of the principal; scaling down of the principal of the debt, as in Turkey in 1881; substitution of payments in paper money, scrip

or cheaper metal for the required payment in gold, as exemplified by the act of the Russian government in 1839 which substituted payments in assignats for those in silver on all domestic debts, and by the act of the Congress of the United States in 1933 which abrogated the gold clause in all public and private contracts and substituted payments in paper; payment of the debt in an almost completely valueless currency, as in Germany, and in a devaluated monetary unit, as in France, after the World War; imposition of a special tax on coupons, as in Austria in 1868 and in Russia in 1885; and withdrawal of the security pledged for the service of the debt, as in Greece in 1893.

Repudiations are generally due to extraordinary circumstances. Most commonly they follow upon the collapse of government finances and of an entire national economy resulting from war, revolution or severe economic crisis. They are caused also by unwise borrowing under usurious terms or borrowing for unworthy purposes. They are also quite generally the result of political changes giving rise to provisional governments, as in Spain in 1823 and in Portugal in 1832; in these cases the succeeding governments refused to be held responsible for debts contracted by their predecessors. In many cases they are due in no small measure to the avarice of bankers, who are ever ready to help a government to float a loan because of the profits involved in the business, and to the ignorance and credulity of the investors who accept in good faith the representations made to them. Repudiations are particularly prevalent in backward countries, for it is here that less responsible governments are to be found and unscrupulous financiers can reap their heaviest harvest.

An extensive repudiation of a domestic debt affects the entire national economy. It has a particularly severe effect upon small investors who have put their savings into government bonds either directly or indirectly through bank deposits and life insurance, and indirectly it hits all creditors, since each creditor is usually also a debtor who finds it difficult to pay what he owes if denied payment of what is owed him. Thus repudiation precipitates a chain of private bankruptcies and a dislocation of commerce. Business in other countries having commercial and financial relations with the country in question and with one another is likewise affected. An extensive repudiation of a foreign debt also reacts upon foreign creditors, while the citizens of the repudiating state gain, through the avoid-

ance of taxation, at the expense of the lending country.

Repudiation generally results in a temporary inability of the government to secure new loans except under very onerous terms and on a pledge of a security or submission to international financial control. Sooner or later, however, the state is able to obtain new loans, once more on normal terms, if not in the same money markets. The repudiation of the old debts may in the long run help the state to obtain new loans, since it releases funds hitherto designated for the payment of old debts for use in the payment of new obligations. If, however, the conditions responsible for the last repudiation persist or return, as frequently happens, another repudiation—this time of the new debt—becomes necessary. Thus in many countries there is a train of successive repudiations at irregular intervals.

In the case of a domestic debt the state's power of repudiation is almost absolute; the state has the right and power to abolish those very property rights of its subjects which it has itself sanctioned. The constitution may impose certain limitations upon the exercise of this right or power by the authorities, but a government will not necessarily be restrained by constitutional restrictions. Domestic creditors are therefore without a legal remedy against repudiation. The courts generally will not entertain a suit by a private citizen for the recovery of a state debt without the government's consent; and the government, determined to carry the repudiation through, will of course withhold consent unless it is sure of being sustained. Thus the only remedy available to domestic creditors is of a political nature. They may bring pressure to bear upon the members of the legislature in opposition to the proposed repudiation, or they may seek to overthrow the government and to substitute a regime which will recognize their claims.

In the case of foreign debts the state's right and power of repudiation are more limited. The government of the foreign creditors is likely to contest the act of repudiation of the debtor government. Both states being sovereign, the issue between them may be settled either by diplomatic negotiations; by the exercise of superior force on the part of the creditor state in the form of military intervention, as in the case of Venezuela and Nicaragua; or by economic boycott or the establishment of financial control over the affairs of the debtor, as in Egypt, Turkey, Greece, Tunis, Liberia and other smaller coun-

tries; or possibly by arbitration, which may be offered by either party and accepted by the other either voluntarily or under pressure. The last method is of recent origin and has been applied in very few cases. Apparently before arbitration can be an effective method rules of international financial law must be arrived at to guide the tribunal. In order to protect their interests more effectively foreign creditors form protective associations; the British Council of the Corporation of Foreign Bondholders and similar associations in other countries have been organized for this purpose.

Small states which have been subjected to coercion upon either repudiation or default have consistently contended that the failure of a state to pay its debts to citizens of another state is not a proper reason for military action. This contention was supported by Lord Palmerston, who declared that British investors in foreign government bonds must assume the risk involved in such investments and in case of repudiation or default could invoke only the unofficial and moral support of their government. Writers on international law have likewise been inclined to uphold the view that military intervention in such cases is improper. The most uncompromising expression of this view is embodied in the so-called Drago Doctrine, named after its author, the foreign minister of Argentina, who declared that public debts are not contractual in character, but, like money, acts of sovereignty which may be repudiated at any time and are not subject to any court of competent jurisdiction; Drago's contention, however, is not supported by modern juridical opinion.

At the Hague Conference of 1907 an attempt was made to substitute the device of compulsory arbitration for that of armed force for the recovery of debts claimed to be due from one government to the subjects of another. A pact was drafted prohibiting resort to armed force by any signatory in such a case except "when the debtor state refuses or neglects to reply to an offer of arbitration, or after accepting the offer, renders the settlement of the compromise impossible, or, after the arbitration, fails to submit to the award." Only a few states ratified this pact without reservation, however, and it has been of no great consequence. The establishment of the Permanent Court of International Justice has somewhat broadened the possibilities of arbitration of these issues. In 1927 the Institute of International Law, meeting at Lausanne, considered the question of the responsibility of a

federal state in case of a default or repudiation by any one of its component states. The institute drafted a rule for the international consideration according to which the federal state is responsible for the financial conduct of its separate states and cannot escape such responsibility by pleading that its constitution does not empower it to enforce the obligations of the latter.

REQUISITIONS, MILITARY. Military requisitions, according to modern usage, are those levies of commodities and services useful to the army which are forced by an invading power from the peaceful population. The term is distinguished today from "contributions," which cover only levies of money above the normal taxes. An invader usually resorted to both methods to supply his army, and often the term contribution was used to include both kinds of payments. It is to be distinguished also from the rather vague term *angary*, usually defined as the right of a belligerent in case of necessity to seize or destroy property, especially vessels, of neutrals provided full compensation is made.

The term requisitions is applied in municipal law to the regulated seizure and use of the

property of its own citizens by a government during a military emergency, a practise usually coupled with just compensation. Thus during the World War practically all the belligerents had emergency legislation legalizing such use of private property.

The origins of requisitions, in the international sense, are to be traced to the rule that war should support war. Until comparatively recent times war was unregulated and belligerents appropriated or destroyed all property, public and private, of their conquered opponents. War was regarded as a contest between whole peoples and no distinction was drawn between military occupation and conquest. Down to the seventeenth century, says one authority, "armies lived wholly upon the countries which they invaded, and swept away what they could not eat by the exercise of indiscriminate pillage" (Hall, W. E., *International Law*, 8th ed. Oxford 1924, p. 508).

With the rise during the seventeenth and eighteenth centuries of modern armies, paid and supplied by their governments, the old practise of pillage was relaxed. The disorder attendant upon its use was destructive of strict military discipline, and the devastation of a territory made later provisioning of armies more difficult. Considerations of military efficiency therefore as well as of humanity led to the substitution of contributions and requisitions as more effective methods of compelling a conquered territory to bear the cost of the war. This inaugurated the practise which is largely responsible for the increasing respect shown private property on land during time of war.

The beginning of this change from the primitive to the modern method of warfare is clearly seen in the 'Thirty Years' War when Gustavus Adolphus forbade his well disciplined Swedish army to take anything from the peasants except what was included in his orders of contribution. Towns agreed to provide the armies with quantities of supplies and of money in return for immunity from pillage. By the end of the century another practise had developed by which generals of opposing armies would enter agreements as to the amount of contributions to be collected, the districts to be assessed and the manner of collection.

The military systems of Europe had become so well organized by the eighteenth century that armies depended for supplies to a great extent on magazine and provision trains. The army regulations of Frederick the Great seem to have

restricted requisitions to supplies for his army and exacted them with strict regard for the needs of the civilian population. The methods of warfare in this period therefore showed a high degree of respect for private property. The treaty of friendship between the United States and Prussia made near the end of the century (1785) went so far as to provide (art. 23) that in the event of war between the two countries requisitions should be paid for.

The eighteenth century saw also, through the influence of Montesquieu and Rousseau, the advent of a new theory of war. These men maintained that war was a contest between states rather than peoples, a view which was accepted rather generally by writers and jurists on the European continent. The logical implication of this view would be to exempt the peaceful population, but on the theory of military necessity it continued to be subjected to these forced levies. In fact modern international law gave legal sanction to the right of a belligerent to all the possessions of his conquered enemy, and contributions and requisitions were assessed entirely at the discretion of the invader. No receipts were given and no payments made for the levies.

Under Napoleon the rule that war should support war was developed and practised on a systematic scale. The long distances traversed by Napoleon's armies and the economic drain on the country made it difficult to rely for supplies on magazines and provision trains. Contributions and requisitions were therefore resorted to as a means of saving France from fresh taxes. On Leipzig, for instance, Napoleon in 1806 imposed requisitions for 150,000 cloaks and 150,000 pairs of shoes; on Berlin for 100,000 cloaks, 100,000 pairs of trousers and 100,000 pairs of shoes. His requisitions were not, however, limited to necessities for the army but included everything of military value. In his Peninsular War forced requisitions were used to such an extent and the excesses committed by his men were so great that he attributed his defeat partly to the hostility of the population aroused by these forced exactions. Where discipline could be maintained, however, his generals forbade pillage. Napoleon seems also to have initiated the practise of giving receipts for contributions and requisitions. This was done not with the thought of payment, for there was as yet no obligation to pay, but in order to prevent abuses.

In the wars of the nineteenth century bel-

ligerents differed in their treatment of invaded territories. Requisitions were used by both sides during the American Civil War and by the Prussians in the Seven Weeks' War. In the Franco-German War of 1870 the Germans at first resorted to large scale requisitions, giving receipts which provided for payment by the French or German government as might be agreed upon at the end of the war. Under the kaiser's orders requisitions were to be limited to the needs of the army of occupation, but in the bitterness of the struggle this policy broke down and anything of military value was taken. The total value of goods requisitioned was put at 134,100,746 francs exclusive of 101,889,814 francs for boarding and lodging of troops, also a form of requisition.

But the Germans soon learned that it was more advantageous to buy provisions than to try to raise them by requisitions and resorted to purchase instead. This method, which had been used by the United States in its war with Mexico and by Great Britain in the Crimean War, was later employed in the Sino-Japanese and the Russo-Japanese war and down to the World War was tending by reason of its greater effectiveness to displace forced requisitions.

At the beginning of the twentieth century, however, the right to use requisitions was still generally recognized. An attempt to formulate rules of requisitioning had been made as early as 1874 in the Declaration of Brussels, but it was not until the Hague conferences of 1899 and 1907 that anything significant was accomplished in this direction. The Hague convention of 1907 on the laws and customs of war contains the generally accepted rules governing requisitions under modern conditions. By articles 46 and 47 of these regulations private property is to be respected and pillage is formally forbidden. Requisitions (art. 52) in kind or services are to be restricted to the needs of the army of occupation, must be in proportion to the resources of the country, can be demanded only by the commander in the locality occupied and must if possible be paid for in cash; "if not, a receipt shall be given and the payment . . . made as soon as possible." This last clause does not specify who is to make payment and leaves the question very much as it was before. Other provisions also are vague. Requisition of services is limited in article 44 to those which do not require "the population of occupied territory to take part in military operations against its own country"; but authorities differ as to types of

work which the invader may require. According to practise the requisitions are levied usually through the local civil authorities and the invader may use whatever force is necessary to compel obedience.

During the World War these rules were construed liberally, especially by Germany and its allies. On entering Belgium the German military authorities ordered individuals and business concerns to declare their stocks of commodities useful for military purposes and then placed embargoes on the export of such items, except to Germany. Both contributions and requisitions were used on a large scale to secure quantities of foodstuffs for daily consumption by the army and of raw materials, machinery, livestock and other things useful for military operations, which were sent to Germany. On Antwerp were imposed requisitions valued at 85,000,000 francs, consisting of cereals, oil cakes, nitrates, animal and vegetable oil, wool, cotton and rubber. At Brussels 116,000 kilos of wheat, meat, rice, sugar and oats were exacted daily. The Germans were accused of seizing milch cows and draft horses in large quantities and sending them to Germany. For these, payments were usually not made, it was alleged, and authentic receipts often not given. Extensive requisitions of services of the inhabitants were also exacted, to dig trenches, work on fortifications, build huts and the like.

The Germans generally gave receipts and in some cases made partial payments for the things requisitioned. In the Treaty of Versailles (pt. VIII, annex I, par. 10) one of the items of reparations imposed on Germany was for "damage in the form of levies, fines, and other similar exactions imposed by Germany or her Allies upon the civil population."

RESALE PRICE MAINTENANCE is the effective stipulation by a manufacturer of the prices at which goods manufactured by him are resold by wholesalers and retailers. Although a resale price maintenance program necessarily involves the cooperation of wholesalers when the merchandise passes through their hands, the problem is primarily one of maintaining stipulated retail prices.

The purpose of resale price maintenance is to prevent merchants from using goods bearing the manufacturer's trademark as "price leaders." The price cutting against which the program is directed does not ordinarily represent reductions merely commensurate with economies achieved by the price cutter in operating his business. On the contrary, prices frequently are cut to the cost of the merchandise or even below. The purpose of such price cutting is ordinarily to give a general impression of low prices or to lure customers into a store in the expectation that while there they will buy other goods yielding the retailer a full margin of profit. In order that such price cutting may be effective, it is essential that the bargain character of the offer be recognized by the public. Widely advertised products of standard quality, articles in popular demand at customary prices, are therefore the ones commonly chosen for price cutting.

The problem of resale price maintenance in its modern form has arisen since 1900. Price leaders, such as sugar in the grocery trade, were not unknown in marketing practise before that date, but branded merchandise was utilized infrequently for bargain offers. The rapid development of the sale of merchandise in packages, trademarked and widely advertised, provided a much broader opportunity for price cutting than existed when the same sort of goods was sold in bulk, often without standardization of quality. At the same time the growth of department stores and later of chain stores led to frequent use of cut prices as a means of attracting patronage. Vigorous price cutting has been one of the outstanding accompaniments of the revolution which has been occurring in retail trade in the twentieth century.

The question naturally arises as to why a manufacturer should concern himself with the prices at which retailers sell goods which he has made but for which he has received payment. On the face of it, an acceptance by retailers of lower margins of profit on his product should stimulate sales for a manufacturer. The case is not so simple, however, for as with other de-

bauches price cutting by retailers has serious after effects. When price cutting of a particular product has become rampant, numerous retailers, antagonistic toward goods which have become a price football, prefer to sell other goods; the sale of private brands of merchandise is promoted and thus the manufacturer encounters increasing sales resistance and finds that it is more difficult for him to maintain his expected distribution. For example, prices on a well known brand of sheets have been cut so frequently and so severely over a period of years that numerous department stores seek to sell instead other manufacturers' or their own private brands. A stock of the price ridden brand may be kept under the counter for sale to those insistent customers who will accept no other, but through the hostility of the retail stores the manufacturer concerned loses many sales to which the reputation of his product entitles him.

The question of resale price maintenance has become a matter of public interest, instead of remaining merely a problem in business policy, as a result of its legal aspects and of concerted efforts in some countries to secure the observance of such a plan. In all countries outside the United States, except Argentina and Norway, resale price agreements are permissible and in most countries violations of such agreements constitute breaches of contract and can be remedied by legal action. Price maintenance contracts are widely used in France, Belgium, Germany and other countries in continental Europe. In Germany they were for some years subject to review by the cartel courts. In Norway the fixing of prices is prohibited by law but "the test as to whether such agreements are to be considered contrary to law is apparently found in the determination whether the profit is reasonable rather than in the mere existence of an agreement" (United States, Bureau of Foreign and Domestic Commerce, "Exclusive Sales Agreements in Foreign Trade," by Bernard A. Kosicki, *Trade Promotion Series*, no. 45, 1927, p. 47). In Argentina such agreements are unlawful but are frequently made. In Canada they are permissible so long as they "do not operate against the interests of the public," and the Combines Investigation Act of 1923 provides machinery for investigation as to whether any particular agreement is against public interest.

In England a manufacturer may enter into an agreement with a wholesaler whereby the latter undertakes to maintain resale prices. A manufacturer may likewise make a price agree-

ment with a retailer to whom he sells directly. Such agreements are enforceable as contracts. When a manufacturer sells to a wholesaler under such an agreement, however, he has no ground for action against a retailer buying from the wholesaler if the retailer cuts the price. Nevertheless, the resale price of widely advertised branded merchandise is usually maintained in England. This result is achieved not by legal action but through trade associations which threaten and enforce merchandise boycotts against offending price cutters. Associations are active in securing the maintenance of resale prices in the drug, publishing, stationery, automobile, grocery, tobacco and other trades. The most common type of association is one which includes manufacturers, wholesalers and retailers, such as the Proprietary Articles Trade Association. The organization and methods vary between trades, but in general the method of enforcement is to cut off supplies of goods from any merchant who fails to observe the stipulated minimum resale prices. The Proprietary Articles Trade Association, which was formed in 1896, included in its membership in June, 1930, 436 manufacturers, 63 wholesalers and 8706 retailers dealing in proprietary drugs and other goods sold in what the English term chemists' shops. Periodically a "stop list" is issued on which are stated the names of wholesalers and retailers who have violated their price agreements and from whom supplies are consequently to be withheld by all members. The association prohibits the sale of goods on its "protected list" to any cooperative society which pays dividends to members in proportion to their purchases. A committee of investigation appointed by the Board of Trade came to the conclusion in 1931 that the law should not be changed to force a modification of existing practises.

In the United States resale price maintenance agreements are illegal. This situation is the result of a series of court decisions rather than of definite legislative enactment. When the Sherman Anti-Trust Act was passed in 1890, resale price maintenance was a problem of no apparent consequence and it was not one of the practises at which the law was aimed. Nevertheless, in later years agreements to effect resale price maintenance were brought under the ban of the Sherman Act and subsequent antitrust legislation.

The first important price maintenance case to be decided in the United States was *Bobbs-Merrill Company v. Straus* [210 U. S. 339

(1908)], in which the Supreme Court held that a publisher could not compel the maintenance of the resale price of a copyrighted book by virtue of the copyright law. In 1911 in *Dr. Miles Medical Company v. John D. Park and Sons Company* (220 U. S. 373) the Supreme Court held it to be illegal under the Sherman Anti-Trust Act for a manufacturer to attempt by agreement or contract to compel the maintenance of resale prices by merchants who had taken title to the goods. In stating the opinion of the court Justice Hughes said: "The complainant [*Dr. Miles Medical Company*] having sold its product at prices satisfactory to itself, the public is entitled to whatever advantage may be derived from competition in the subsequent traffic."

The decision in the *Dr. Miles* case is the chief landmark in a long series of legal decisions on the subject of resale price maintenance. Although the decision established a precedent which has strongly influenced all subsequent decisions, the court was not unanimous. In his dissenting opinion Justice Holmes stated: "With regard to things like the latter [*Dr. Miles' medicines*], it seems to me that the point of most profitable returns marks the equilibrium of social desires and determines the fair price in the only sense in which I can find meaning in those words. The *Dr. Miles Medical Company* knows better than we do what will enable it to do the best business. We must assume its retail price to be reasonable, for it is so alleged and the case is here on demurrer; so I see nothing to warrant my assuming that the public will not be served best by the company being allowed to carry out its plan. I cannot believe that in the long run the public will profit by this court permitting knaves to cut reasonable prices for some ulterior purpose of their own, and thus to impair, if not to destroy, the production and sale of articles which it is assumed to be desirable that the public should be able to get."

Following the *Dr. Miles* case a number of decisions of the same tenor were rendered. One of especial significance was that in the *Beech-Nut Packing Company case* [Federal Trade Commission v. *Beech-Nut Packing Co.*, 257 U. S. 441 (1922)], brought under the Federal Trade Commission Act. That company sold its products chiefly to wholesalers, who in turn resold to retailers. The company placed identifying marks on every package of goods which it shipped, and when it learned that a retailer was cutting prices it had an investigation made by

its salesmen or sought to learn through other sources from what wholesaler the goods had been bought by the retailer. To that end the identification marks on the packages were especially useful. The company then refused to sell additional supplies of merchandise to any distributor who furnished *Beech-Nut* goods to dealers on its list of price cutters. In its decision the Supreme Court ruled that although the company entered into no agreements and contracts regarding the maintenance of resale prices, its methods of regulating the distribution of its products enabled it "to prevent competition in their subsequent disposition by preventing all who do not sell at resale prices fixed by it from obtaining its goods."

The net result of the rulings of the United States Supreme Court on this subject is in 1933 that a manufacturer cannot legally force wholesale and retail distributors of his products to maintain suggested resale prices, provided the merchants take title to the goods. A manufacturer is permitted to name standard resale prices for his products and he may attempt by argument to persuade the distributors to refrain from price cutting. The Supreme Court also has stated that a manufacturer has the right to refuse to sell to any party for any reason or for no reason. The manufacturer may not, however, state that in the future he will refuse to sell unless prices are maintained; the acceptance of an order cannot be made conditional upon assurance that prices will not be cut. The legal status of the use of moral suasion for securing the observance of stipulated resale prices is therefore highly uncertain, and unless new legislation is enacted the Supreme Court presently will be compelled either to modify its reasoning regarding the rights of a manufacturer to take steps to secure observance of resale prices or to prohibit the suggestion of resale prices by a manufacturer.

During the entire period since the decision in the *Dr. Miles Medical Company* case in 1911 Congress has had before it almost constantly one or more bills to authorize the effective control of resale prices by a manufacturer. In years when the trend of prices has been downward and price cutting therefore especially prevalent the interest in these proposed measures has been greater than in periods of rising prices. After the passage of the National Industrial Recovery Act in 1933, provisions for preventing merchants from selling goods below cost, with certain necessary exceptions, were incorporated in several

"codes," but during the first year no attempt was made to compel the observance of stipulated resale prices.

From the standpoint of public interest the problem of resale price maintenance involves two important questions. First, is a practise of resale price maintenance likely to result in exploitation of consumers? Secondly, are any parties who deserve public protection injured by price cutting?

As to the first, one may observe that the resale prices stipulated by manufacturers must be reasonably fair or the merchandise will not be purchased by consumers. The goods for which manufacturers typically desire to have resale prices maintained are in competition with other merchandise of the same sort and with various substitute articles. There is no serious danger that consumers will be exploited by any such scheme. They would merely be prevented from securing the benefits of extreme and often predatory competition. In numerous cases manufacturers now succeed in obtaining observance of stipulated resale prices and consumers continue to buy the goods without complaint.

The second question, concerning those interests adversely affected by price cutting, opens up a wide field. Much of the demand for maintenance of resale prices during the last twenty-five years has come from small merchants who have sought thereby to avert the competition of large retail establishments, such as department and chain stores. A revolution in the organization of retail trade has been taking place akin to the industrial revolution in manufacturing, and price cutting has been one of its accompaniments. Although the price cutting frequently has been excessive, the legalization of resale price maintenance would not have stopped the revolution. Similar changes in retail trade have taken place in England despite the measures for control of resale prices adopted in that country, and in the United States the enactment of resale price maintenance legislation would not have given and will not give effective protection to small retailers against types of organizations which have inherent competitive advantages. Even if it be desirable to protect by legislation one type of business organization against some competing type, in this case measures far more extensive than the legalization of resale price maintenance would be needed to perpetuate the existence of certain types of retail establishments.

From a business policy standpoint the serious

evils of price cutting could in numerous instances be largely averted by the manufacturers themselves if they handled their marketing plans in more orderly fashion. One manufacturer, for example, will sell directly to large retailers and also to wholesalers. The wholesalers seek to compete with the manufacturer's salesmen, cutting prices to secure orders. The retailers who benefit from the cut prices in purchasing are thereby tempted to cut prices in selling. Such a company has an incongruous distribution program. Another rather common case is that in which a manufacturer induces or permits too large a number of wholesalers and retailers to carry his product in a particular market; he intensifies his distribution to a point where severe competition is inevitable. The practise of manufacturers which most commonly encourages price cutting by distributors is that of granting extra allowances or discounts to large or favored buyers. It obviously is illogical and unsound for a manufacturer to attempt to standardize the resale price on his product unless he first standardizes his own selling price. Until such disorderly and inconsistent marketing practises as these are corrected, the legalization of resale price maintenance is not warranted.

From a broad economic point of view the question of resale price maintenance illustrates the concomitants of revolutionary changes in methods of marketing. It is even more significant in emphasizing the fact that under modern conditions business is a continuous series of transactions rather than a succession of isolated trades. This concept of business as a continuous series of related transactions and the effects of current happenings on future patronage are matters to which insufficient attention has been given by various economists and by the American courts in dealing with the question of resale price maintenance.

RESEARCH as defined by Webster's *New International Dictionary* consists of "careful or critical inquiry or examination in seeking fact or principles; diligent investigation in order to ascertain something." This definition would include not only the investigations of the physicist and the philosopher but those of the physician attempting to diagnose a disease or of a mechanic tinkering with a car. More narrowly and for present uses more pertinently defined, research is the manipulation of things, concepts or symbols for the purpose of generalizing to extend, correct or verify knowledge, whether that knowledge aid in the construction of a theory or in the practise of an art. The mechanic or the physician therefore is a research worker only when he attempts to generalize about all automobiles or all patients of a given class.

If Webster's definition is too inclusive, the opposite is true of a recent tendency to identify research with a particular method of investigation, because through a misconception of scientific method it sets up a criterion which excludes many important contributions to knowledge. A study is scientific when its data are subjected to logical analysis resulting in the development of a theory, whether those data are secured by ex-

periment, by statistics or by common sense. The fact that experiment cannot be performed in a given case does not eliminate the possibility of scientific study, although it does put a premium on the ingenuity of the student.

The traditional research worker is a solitary individual devoted to the discovery of truth for its own sake. If there is a tendency to depart from that tradition today, it is in part because of a change in the conception of the investigator's function. Thinking can be carried on best in solitude; and in so far as researchers think, it is just as necessary as it ever was for them to work alone. As the emphasis shifts from the rational to the experimental or observational aspect of research, however, economies of time and checks to avoid error can be introduced by co-operation. The increasing complexities of data and the development of technique and knowledge make such cooperation essential; and thus there is attracted to research a more gregarious, more normal individual, who as a result of shared activity is less intellectually responsible than his traditional, solitary ancestor.

While the pursuit of truth for its own sake is still asserted to be the primary aim of all research workers, there remains a sharp distinction between students of pure and students of applied science, the former receiving much of their remuneration in honor, the latter in cash. Actually, except in the physical sciences, the distinction is in attitude and pay rather than in method or result. In fact a candid recognition of the irrelevance to the social sciences of the ideal of acquiring knowledge for its own sake would release a number of paralyzing intellectual inhibitions.

Although research organization has grown rapidly since the World War, it has a long history. The ancient schools and the universities that followed them were company rather than craft unions. The tendency toward craft organization appeared with the formation of the Prussian Academy of Sciences in 1700. By the close of the eighteenth century there were scientific societies in most of the major countries of western Europe, while in America the American Philosophical Society was organized in 1743 and the American Academy of Arts and Sciences in 1780. Even these societies were not strictly craft associations, because their membership was as diverse as the sciences. Increasing specialization during the nineteenth century led to the formation of bodies representing smaller branches of knowledge, divisions based not only on subject matter but also on technique. This may have

promoted the development of techniques and the addition of facts to the sum total of available data; but its general effect was disintegrating, for it made possible, if it did not create, the uneducated research specialist.

The situation was somewhat ameliorated by the universities. In the middle of the nineteenth century the German universities replaced the lecture with the seminar as a means of teaching graduate students, thus turning to the accumulation as well as to the transmission of culture. In the United States a movement to make universities centers not only of instruction but also of research began with the founding of Johns Hopkins University at Baltimore in 1876. The growth of this movement became an important factor in American intellectual life. The university gave to the scholar the congenial environment and the economic security essential to uninterrupted work, but it also forced him to associate with his colleagues in other fields and prevented him from becoming as narrow a specialist as technical development alone would have permitted.

If the universities tended to counteract some of the bad effects of research specialization, industry accentuated them. The industrial revolution started with a few basic inventions and the resulting interaction of industry and applied science greatly accelerated the growth of each. An activity as profitable as research was soon taken under the wing of the corporation it benefited and organized for very practical ends. Had it been possible to produce inventions to order, pure science might have been neglected. But since they were frequently accidental and came so often from a laboratory devoted to knowledge for its own sake, pure science was supported by industry as being at least potentially profitable. That support has been chiefly through gifts to universities and institutes or the occasional employment of the pure scientist in the industrial laboratory.

Although organized industrial research is not more than twenty-five years old, the amount of money expended upon it annually was estimated in 1930 to be between \$100,000,000 and \$200,000,000. The industrial research organizations spending this money vary in size from a small and inadequate laboratory manned by a single chemist or engineer to the Bell Telephone Laboratories, which in 1934, with about 4000 employees and an annual budget of approximately \$15,000,000, was one of the best equipped laboratories in the world. Competitive

industrial units have discovered research no less than competition to be the life of trade and have associated themselves for the carrying on of joint research projects too expensive for any single unit to support. Such associations undertake not merely basic and technological research but investigation of marketing problems as well; competitive units thus combine in order to learn how better to compete.

Research has also become a province of government in most modern countries. Such investigation often borders upon fact reporting, although it may involve pure scientific research—all aimed at the public welfare as a whole. Both in the state universities of the United States and in the great government supported universities in the rest of the world research of the highest order is supported by taxpayers. The research tends, in the United States at least, to be practical in aim. Government research bureaus usually cooperate closely with industry and the universities, in the interest not merely of economy but of an interchange of point of view. In the United States and notably in Japan industrial organizations maintain research workers in government laboratories.

Specialization might have continued to dominate research for a long time had it not been for the World War. The problems raised by that catastrophe required a rapid integration of the results of thousands of specialized studies. The difficulty was not new; ever since the middle of the nineteenth century a need for integration in medicine and biology had been recognized and had led to the creation of institutes for investigation. But the need during the war was unprecedentedly great. In the United States the natural sciences responded first; in 1916 the National Research Council for the promotion and integration of research in the physical and biological sciences and their application to engineering, agriculture, medicine and other useful arts was formed as a war body, and in 1918 it became a permanent organization. A few years later two other great councils, the American Council of Learned Societies (1920) and the Social Science Research Council (1923) were organized, the former to deal largely with cultural studies, the latter to promote and integrate the social sciences and the related useful arts of industry, government and public welfare. The councils soon took an active part in the stimulation of research, attempting to map out fields of study growing out of current problems rather than out of traditional disciplines; to act as clear-

ing houses for projects and personnel; to encourage young men and women to broaden their backgrounds by giving fellowships to the most brilliant; to facilitate the interchange of ideas by calling and financing conferences; and, finally, to make accessible to the public the significant results of research.

Parallel with and in part stimulated by the development of the national councils appeared university councils, institutes and committees whose purpose was to guide and coordinate research locally. Their most important contribution has been to break down artificial intellectual barriers by setting up problems that cross several disciplines. If the resulting cooperation has been more educational to the cooperators than productive of new knowledge, that is because the collection of data has been overemphasized. Until theoretical integration is accomplished the quantity of work turned out by the institutes, councils and committees will continue to exceed its quality. Even in their present state the co-operative studies are of use, however, in policy making and educational planning.

Support for research, outside of government and industry, comes from individuals, university endowments and increasingly from foundations. In 1932 there were in the United States about 125 foundations with a combined capitalization of almost \$1,000,000,000 and an annual expenditure of well over \$50,000,000. It is not surprising in view of the history of philanthropy to find medicine and public health the chief beneficiaries, followed closely by general education. The natural and social sciences together receive considerably less than the amount devoted to general education. It is significant that since 1931 the total grant from foundations for research in the social sciences has exceeded the amount spent for physical sciences. The accompanying table shows the distribution of foundation gifts during 1931.

The financial stability of the great foundations and the scientific and educational statesmanship exercised by their executives make them a more satisfactory means of support than capricious individuals or changing legislatures. But the very factor that makes them stable creates potential problems. Thus the 20 largest foundations account for over 70 percent of the total capital of the whole group; almost half of all the foundations, with an aggregate capital of over \$650,000,000, are located in New York. Furthermore the national councils have their offices in New York and Washington. While such geographic proximity makes possible a very close coordination of activities, it also opens the way to undesirable domination. The possible domination has not become actual.

The foundations have not confined themselves to the financing of projects. Through their executives they have performed another valuable service arising more from the nature of their jobs than from their financial power. Traveling all over the country in search of talent, the executives have functioned as well in the cross fertilization of research. Outside their field of specialization -and many of them have been generally rather than specially educated- they have absorbed plausible ideas more or less uncritically in one institution and carried them to another. A more critical or expert attitude would not have been advantageous, for unconventional intellectual approach, although it sometimes seems misguided, often results in new and useful integrations.

Research abroad does not always follow the American pattern. In England, where there are no large foundations and few institutes, the solitary worker and the talented amateur with private means are not unusual. The government through its Department of Scientific and Industrial Research, established in 1917, encourages investigation by granting funds to universities

TYPES OF ACTIVITY SUPPORTED BY FOUNDATIONS

FIELD	TOTAL GRANTS PAID IN SUPPORT OF			
	EDUCATION	SOCIAL ACTION	RESEARCH	TOTAL
Medicine and public health	\$10,600,437	\$4,447,256	\$2,096,488	\$17,144,181
General education	13,498,416		80,782	13,579,198
Social sciences	2,867,435	226,600	2,748,113	5,842,148

and individuals and maintaining several institutes. The total expenditure of the department in 1932 was £534,700. The older universities seem to stress education rather than research, although they contain research institutes of various sorts. Canada, Australia and other dominions follow the British plan of centralized administrative control of research, assisted, however, by boards or councils which advise the government in the formulation of projects and distribution of funds. In Germany, where the university ideal has been the advancement of knowledge rather than the training of teachers, both individual and organized research has been encouraged, as a rule by state support but also by institutes maintained by private contributions. Industrial and business research has been well developed, largely by industry itself but with some assistance from government institutes. In France there are special institutes both within and without the universities, supported sometimes by the government and sometimes by private contributions. The government maintains several industrial research laboratories.

The Japanese organization of research is similar to the American except that the work carried on in universities and institutes is largely state supported. There are learned societies in all the sciences and there is a National Research Council. The best work is practical and plays a part in national self-preservation. Soviet research is practical, but from a rather different point of view. Its importance in the eyes of the Communist government which supports it is evident from the fact that between 1929 and 1933, when the world was in the economic doldrums, the number of research institutions in the Soviet Union increased from 400 to 840. In 1933 the 840 comprised over 35,000 workers. Pure science is avoided as capitalistic, but, as has been pointed out, the line between the pure and applied science is difficult to draw. A radically new departure in Soviet research is the absolutely unrestricted social utilization of all scientific discoveries.

Considerable work toward coordination in research has been done by the League of Nations through a number of organizations which are directly or indirectly under its patronage. The International Institute of Intellectual Cooperation, an auxiliary body, has since 1925 contributed much to coordinative research.

The world wide depression following 1929 placed research in a curious situation. On the

one hand, many groups were calling for a halt in research leading to industrial invention. And although research in social science might be expected to accelerate social invention to the point of equality with mechanical invention, conservatism and fear led to recommendations that it too be curtailed. A more serious danger than temporary curtailment lies in the attitude developed by some social scientists toward disinterested work. Discouraged by a world that has not grown better with recent social discoveries and inventions, they are willing to present social studies as propaganda for what they consider at present the good life. While the humanitarian attitude is commendable, its acceptance would eclipse social research for a generation. At the same time the depression itself has made the support of research difficult if not impossible. In the universities where a choice has been presented education has been maintained at the expense of research. In industry research has been curtailed as the necessity for reducing costs has become more pressing. How far that reduction has gone is difficult to estimate, and its effect on the future of research is impossible to conjecture.

Support for research may be expected to increase with returning economic order. The organization for research has been created; the vital problem is that of adequate personnel to make use of the administrative organization. That it does not exist at present is largely due to two factors. In the first place, the need has developed more rapidly than facilities for training. Since problems were pressing and society was willing to pay for an attempted solution, untrained men and women were drawn into research. In the second place, the shift of emphasis from thinking to the collection of data has resulted, in the social sciences at least, in much misplaced effort. Statistical method has supplemented and replaced experimentation, but because of the pressure of demand few statistical workers have acquired the theoretical background necessary for an understanding of the significance of the formulae with which they work. Since anyone can learn a correlation formula and how to run an adding machine, the qualifications for research have been reduced to a point where little more than high school education is required. The result has been a selective lowering of the type of intelligence attracted to the social sciences and thus a serious danger to their advancement. The depression may have a salutary effect in cutting off some of these less

intelligent fact finders and in forcing the surviving workers to think more about the material in hand and to collect new material in terms of specific problems. When the next crisis occurs, the scientist may be able to confront a condition with a theory.

RESORTS. Although knowledge of the healing properties of certain springs was fairly common in ancient times, health resorts were not widespread until the period of the Roman Empire. Numerous architectural remains extending from the British Isles to Asia Minor and northern Africa testify to the importance of bathing resorts in Roman society. The custom of bathing in medicinal waters fell into disuse during the Middle Ages and was not revived until the Renaissance. With the development of science in the eighteenth century, some knowledge was attained of the chemical basis of the tradition-

ally accepted curative properties of the various waters. This in turn laid the foundation for modern balneology.

As an additional inducement to the aristocratic clientele who from earliest times had been the chief patrons at baths and health resorts various forms of entertainment were provided for the diversion of patients during the course of their treatment. Gardens and walks were laid out and concert and billiard halls were built; in addition there was usually a casino where dancing and various forms of gambling were permitted. The discovery of mineral springs at Spa, Belgium, resulted in the development of one of the most celebrated health and pleasure resorts in Europe, and the name Spa was soon applied to all similar establishments. Until the French Revolution Spa was the favorite resort of the royalty and nobility of many countries.

The nineteenth century witnessed the rise of seaside watering places as health and pleasure resorts: in Europe along the coasts of Normandy and Brittany, the North Sea, the Baltic Sea and the Mediterranean and in North America along the Atlantic seaboard. At the same time under the influence of modern medico-climatology climatic or atmospheric health resorts were introduced, among which mountain and winter resorts, stimulated by the development of winter sports, became exceedingly popular. An important factor in the increasing patronage of all types of health and pleasure resorts was the extension of transportation facilities. The railroad especially enabled large numbers of people to visit distant baths. In Germany Baden-Baden, for example, had 391 patrons in 1800, 33,623 in 1850, 48,842 in 1860, 47,682 in 1880 and 62,601 in 1890. The decline between 1860 and 1880 may be attributed to the fact that in 1872 gambling was forbidden and visitors who had come to gamble were thus eliminated. Since 1933 gambling has again been permitted at several resorts in the Reich, including Baden-Baden. Other familiar health and pleasure resorts which for over a century have been patronized by thousands of visitors annually are Wiesbaden, Nauheim, Aachen, Kissingen and Ems in Germany; Karlsbad and Marienbad in Czechoslovakia; Gastein, Bad Ischl and Villach in Austria; Vichy, Aix-les-Bains and Évian-les-Bains in France; Montecatini di Val di Nievole in Italy; and Bath, Harrogate and Buxton in England. Mention should be made also of such Mediterranean resorts as Nice, Cannes, Menton and Monte Carlo, whose warm climate has attracted

increasing numbers of visitors during the winter months and whose natural advantages have been exploited chiefly for pleasure purposes.

In the United States health and pleasure resorts were developed shortly after the War of 1812 when hotels were built at Saratoga and White Sulphur to accommodate the growing numbers of visitors attracted by the restorative properties of the springs. A vogue for surf bathing and the popularity of the seacoast in summer gave new impetus to the development of fashionable watering places, which by the end of the century extended from Maine to Florida. The increasing wealth and leisure of large groups of the population led to the erection of pretentious villas at Bar Harbor, Newport and other points in New England and along the coasts of Florida and California. The social prestige of these resorts was enhanced by the introduction of polo, regattas, horse racing and other leisure class sports which served as an added attraction to visitors.

The economic importance of health and pleasure resorts lies in their modern organization into large scale industries and investments. In countries where bath or watering places are operated by the municipality or state they are the source of considerable public revenue, even in cases where patronage is largely seasonal and where maintenance costs including expenditures for publicity and entertainment are high. Frequently some form of luxury or sojourn tax is imposed upon visitors. In Italy, for example, the receipts from sojourn taxes in 1929 amounted to 31,600,000 lire.

The form of operation of baths varies considerably. In 1905 in Germany of 261 curative springs 37 were public property (25 publicly operated, 12 rented out), 6 were crown property, 36 were municipal property, 62 were held by stock companies and 120 were privately owned. Although these figures have been somewhat altered since the World War, they may be considered indicative of prevailing types of operation. In the United States pleasure and health resorts are for the most part privately owned and operated, subject only to certain taxes imposed upon commercial amusements. In all countries tourist traffic generally is augmented by the presence of popular baths, mineral springs, watering places and pleasure resorts and indirect profits to hotels, restaurants, pensions and sanatoria are greatly increased.

The importance of medicinal springs and baths in European countries, notably France

Germany, Austria, Poland and Rumania, is reflected in the passage of so-called health resort laws regulating such enterprises. The legislation usually contains provision as to the conditions under which a place may call itself a health resort. The health resort laws usually require the presence of natural, locally fixed curative properties whose efficacy is officially recognized; facilities for the utilization of these curative agencies, including lodgings for travelers and adequate medical services; and a high development of sanitation. As a rule the imposition of a *Kurtaxe* is provided for in the grant to a municipality of the title of health resort. At the same time it is stipulated that the receipts from the tax shall be applied only to the improvement and expansion of the establishment and to operation, sometimes including advertising.

In order to safeguard their mutual interests most European health resorts have formed associations. In France there are the *Fédération des Stations Thermales et Climatiques de France*, the *Union des Groupements Scientifiques et Techniques du Thermalisme et du Climatisme* and the *Union des Etablissements Thermaux et des Stations Climatiques de France*. In addition there is under the Ministry of the Interior the legally created *Commission Permanente des Stations Hydrominérales et Climatiques de France*, which is entrusted with the study of questions relating to the discovery and development of such places. In Germany organization has been in charge of the national government. The baths have representatives of their interests in the bath division of the *Bund Deutscher Verkehrsverbände und Bäder*, which is a constituent member of the *Reichsausschuss für Fremdenverkehr*, under the *Minister für Volksaufklärung und Propaganda*. Under the national committee are the state tourist travel associations, with which regional bath organizations are affiliated. In addition there are scientific associations, balneological and climatological societies whose purpose is to further the development of health resorts generally.

The provision of health resort facilities for people of the middle and lower economic levels has received increasing attention since the World War. In England and in Germany public and private welfare agencies have stressed the value of medicinal springs as a public health measure and have actively promoted the establishment of medium priced sanatoria and "cure homes" in connection with existing baths. Under the terms of the prevailing social insurance systems

in certain countries it is possible for war victims and subscribers to sick benefit funds to visit health resorts. In 1929 in Germany 20,000 such persons were given treatment. In Soviet Russia all health and pleasure resorts are state property and form an important part of the nation wide public health and welfare program.

RESTAURANTS. The term restaurant in its most general sense means simply a place where refreshment or meals are sold. Derived from the Latin *restaurare* and the French *restaurer* meaning to restore, it did not come into use until the latter part of the eighteenth century.

The development of restaurants or public eating places may be viewed as the transfer of the eating function outside the home or the separation of the eating and the sleeping place. In primitive and simple societies the two activities characteristically were carried on under one roof, often in the same room. With increasing mobility and travel there arose a need for food in conjunction with a night's shelter some distance from home, a demand which has continued in importance into modern times, especially in the hotels of small towns. A second sort of demand

arises when the arrangements at the place of shelter or the home do not permit or encourage the preparation and consumption of food on the premises; the resident in a lodging house or the traveler at a hotel not equipped to serve meals must perforce look elsewhere for food. With increasing urbanization and participation of women in industry this group is augmented by apartment hotel dwellers who have little time or inclination to prepare three meals daily. It is supplemented further by those who find it cheaper or more convenient to eat out than to manage domestic servants. Another large group of restaurant patrons comprises those whose occupational tasks take them out of reach of their homes for the noonday meal. The increase in this group, with the growing size of cities and the lengthening of commuting distances, has formed the basis of an extensive mass feeding industry. There are also large numbers of persons who by way of variety or amusement choose occasionally to eat outside the home. It is this group which provides the clientele for what have traditionally been recognized as restaurants per se; that is, establishments presided over by trained chefs, catering to fashionable patrons. There are besides many who, although they take their meals at home, find their ordinary recreation and social or business contacts in cafés and sidewalk restaurants, particularly on the continent of Europe.

Until the seventeenth century, eating outside the home occurred primarily in inns, hotels (*q.v.*) or monasteries which provided food and lodging for travelers. Gradually the tavern, or that part of the inn where food was served, developed as a separate institution, serving local residents as well as travelers. With the introduction of coffee and tea into Europe in the seventeenth century there appeared the coffee-houses of England and the cafés of France, which performed the important function of communication and social and mental stimulation in the days before newspapers, wireless and steam engines were commonplace. Inns and taverns on the English model were established in America during colonial times, soon becoming meeting places for the transaction of business by sea captains and merchants as well as social and political centers for leading citizens.

The term restaurant was first applied in the United States and in England to the dining rooms of large hotels and to a few high class separate establishments serving meals à la carte, as distinguished from the more ordinary tavern,

coffeehouse or chop or steak house. Toward the end of the nineteenth century there was a considerable development of the former type of business to meet the demands of fastidious diners and theatergoers, the *nouveaux riches* of a gilded age. The need for foods served at low prices, without the necessity of tipping, for those of modest purses has been met in a number of ways. The American cafeteria dates back to the Exchange Buffet, opened in New York in 1885 for men customers only, where patrons helped themselves and ate standing. The automat, where a nickel dropped into the appropriate slot releases the desired food, was introduced first in Germany, but had its greatest success in New York. Cooperative restaurants, which have attained some success in European countries, are of negligible importance in the United States. Prior to prohibition, the saloons with their free lunches were an important factor in meeting the working man's food needs. The peculiarly American contributions to restaurant types are establishments meeting the demand for speed combined with economy: the cafeteria, automat, fountain lunch, sandwich shop and drug store counter. The "speakeasy" of the prohibition era was in a class by itself. The tea room and neighborhood restaurants operated near or in conjunction with apartment hotels have in many cases become increasingly a permanent substitute for the home kitchen. The prominence of the tea room in the United States is closely associated with the advent of prohibition, for with the disappearance of liquor as a stimulus to appetite patrons became more critical of food quality. The entrance of women into the field, at first through tea rooms of their own and more recently as managers in other types of restaurants, generally raised standards of cleanliness and daintiness of foods served.

In Europe the combination of beverage with food dispensing has always influenced the type of establishment. On the continent cafés and restaurants frequently supply only incomplete food service, specializing in beverages and ices. They remain places for leisurely social gatherings, the reading of newspapers, writing and political discussion rather than for dining. Complete restaurants, catering to the epicure, are found par excellence in Paris but also in other continental cities. Dining out still remains in western Europe largely a social occasion of unusual significance. Students and individuals unattached to family groups frequently find that the most satisfactory arrangement is to eat in

pensions or boarding houses. In France the *prix fixe* restaurants serve a cheap table d'hôte for working men, and the still cheaper bouillon restaurants provide for semiservice; in Germany and Austria there are some municipally operated establishments. But typically the European working and middle class family still eat at home. In the past thirty years, but primarily since the World War, an increasing number of factories both in Europe and the United States have provided lunch rooms or latterly cafeterias for their employees. Such lunch rooms are ordinarily not profit making and seldom indeed make expenses. The new organization of society in Soviet Russia has resulted in the development of communal restaurants for a large section of the urban population. In 1931 the *Soviet Union Review* reported that 31,500,000 persons were eating in community restaurants.

Detailed statistics for the restaurant industry are available only for the United States. The United States Census of Occupations shows an increase in restaurant, café and lunch room keepers from 60,832 in 1910 and 87,987 in 1920 to 165,406 in 1930, a rise of 88 percent for the latter decade, in contrast with a population increase of 15.7 percent for the same ten-year period. Official figures for the actual number of eating places and restaurants are available only for 1929, when the Census of Distribution showed 134,293 establishments, or approximately one for every 900 inhabitants. These are divided into the following classifications:

	NUMBER OF STORES	SALES IN 1929
Restaurants with table service (including tea rooms)	36,214	\$988,472,912
Lunch rooms	57,612	541,701,515
Cafeterias (including automats)	3,124	272,738,813
Lunch counters (including sandwich shops)	17,119	162,180,671
Fountain lunches	1,906	64,564,785
Refreshment stands	7,764	46,004,898
Soft drink stands	10,393	42,891,927
Box lunches	161	6,334,934
Total restaurant group	134,293	\$2,124,890,455

In addition to the above establishments, allowance should be made for the sales of sandwiches, meals or both by 34,844 drugstores with fountains, 2234 cigar stores with fountains, 60,607 confectionery stores with fountains and an unknown number of fountains and restaurants in department stores. The census does not give a figure for the number of eating establishments in hotels, but shows a total seating capacity of

610,762 in dining rooms of hotels open all year and 274,571 in resort hotels open from two to eight months per year. A trade association estimates that when corrections are made for restaurants and food counters in other types of establishments than those classed in the restaurant group by the census, and for lunch carts and wayside stands which failed to send in reports, the total number of food serving outlets in 1929 approximated 250,000, or one per 480 inhabitants. It should be borne in mind that besides meals restaurants sell bakery products, candy, ice cream, fountain drinks and tobacco products in increasing degree.

There are many reasons for this increase in eating places in the United States. Urbanization augments distances from home to work, draws women into industrial occupations and results in smaller families and increased numbers of independent individuals unattached to families. In addition to the decreased time of working women for housework the relative scarcity of domestic service in the United States has thrown more families into the class of restaurant patrons. The noted mobility of the American population, shifting about in search of jobs and other advantages, and the spread of tourist travel consequent upon the wide use of the automobile have contributed to restaurant patronage. The increased real wealth of the post-war period was apparent in the shift from lunch sandwiches carried from home by many commercial and factory employees to regular patronage of commercial restaurants or lunch rooms.

Viewed as an industry the restaurant trade presents many peculiar problems. Successful management requires not only ability to prepare and serve food efficiently but expert knowledge of food buying, dietetic science, careful cost accounting and pricing, correct judging of clientele demands and the adjustment to seasonal, holiday and weather fluctuations so crucial to an industry handling perishables. Experimenting with prices is hazardous, as a general upward or downward change will bring an almost complete change in clientele and patronage must be built up all over again. Pricing of individual portions frequently spells the difference between profit and loss. The restaurant industry is characterized by an unusually high expense ratio as compared with other retail industries. The reasons are that operating expenses include the cost of preparation of raw materials into a different product, and that it is impossible to separate

the processing from the serving expense. If the latter could be separated, it would probably be around 15 percent. In the successful, well managed establishments food expense accounts for 40 to 50 cents per dollar of sales, wages 25 cents, rent 3 to 7 cents, other operating expense 8 to 13 cents and gross profits 10 to 15 cents. The wages percentage does not increase notably in establishments providing elaborate service, tips being relied upon to furnish the additional compensation. According to figures in the United States Census of Distribution 19 percent of all eating places were responsible for 69 percent of the total volume of sales. Among the remaining group food and operating expense ratios are higher, and the mortality rate is tremendous. It is roughly estimated that of four new undertakings only one succeeds.

The development of restaurant chains has been slow, largely because of the perishable nature of restaurant products. In the United States in 1929 there were 3392 restaurants belonging to chains, or 2.5 percent of the total number, accounting for 14 percent of total restaurant sales. But the greatest success with chain restaurants has been achieved in Great Britain.

The types of labor used in the restaurant industry vary widely with the nature of the eating place. In the United States the formal dining rooms of large hotels and the pretentious fashionable restaurants of the larger cities are usually managed by a chef of French, German, Swiss or Austrian nationality, trained under the European apprentice system. Under him are one or more highly skilled and specialized cooks. Bus boys and dish washers are usually transient and unskilled. Waiters in the more pretentious establishments are usually men; in more modest restaurants women are frequently waitresses and are increasingly being employed also as cooks. The tea room and canteen particularly offer a field for women cooks.

Union organization has not made much headway in the restaurant field. The Geneva Association, an international guild of trained waiters formed in 1877, includes only a small group of professional waiters. In the United States the Hotel and Restaurant Employees' and Beverage Dispensers' International Alliance, an organization affiliated with the American Federation of Labor, originated in 1891; in 1932 it reported a membership of 28,000. The organization lost membership heavily during the prohibition era but along with other unions showed signs of renewed activity under the National Industrial

Recovery Act of 1933. In 1924 the International Labor Office reported unions of waiters in nineteen countries. In Germany the Bund der Hotel-, Restaurant- und Café-Angestellten has exerted some influence on conditions since its formation in 1878, although in 1927 it reported a membership of only 18,500. The conditions prevailing in the industry have not been conducive to successful union organization. The highly transient character of most dish washers and kitchen helpers has made conditions among them particularly bad. Hours of labor in the restaurant business as a whole are usually long and most often broken. Dish washers frequently work 78 or more hours per week, although some of those hours are spent in relative idleness during the slack periods.

Tipping as a means of remuneration for labor is more important in the occupation of waiting than in any other field. A few restaurants have successfully abolished tipping by adding a flat 10 percent to the bill, which is turned over directly to the waiters, but the practise has not been widely copied. An alternative system is for the entrepreneur to pay the employee the competitive wage rate with the understanding that the former shall receive all the tips. A notable regressive aspect of the custom of tipping is that the persons eating the cheapest meals pay relatively bigger tips. Laws forbidding tipping have long been on statute books, but with little effect.

Government regulations affecting the conduct of restaurants have been concerned chiefly with sanitation. In most states and many cities there are minute regulations covering sanitary and safety requirements. The law generally holds that the restaurant is a vendor as well as a server of food and hence is liable for any injury caused by harmful or unfit foods. In England sanitary control is exercised through the requirement that every restaurant have a government license. On the continent restaurants typically come under the regulations for liquor dispensing establishments. Very few states in the United States have laws covering restaurant employees as such. General workmen's compensation laws and legislation restricting hours or establishing a minimum wage for women have included the restaurant industry within their scope.

RESTRAINT OF TRADE, like most general legal phrases, is a term of inexact meaning. Historically its use originated with contracts not to compete. There were in the main six types of such contracts: a promise by a worker not to compete with his employer after the termination of the employment; an agreement by the seller of a business not to compete with his buyer; a covenant by a lessee not to engage in a particular trade upon the leased premises; a covenant by a purchaser not to dispose of the goods purchased in competition with the seller; an agreement by partners not to engage in a competing venture during the partnership or not to compete with the firm after their retirement.

In the early common law contracts not to compete were regarded with hostility by the courts. The earliest reported cases were concerned with engagements by apprentices or craftsmen not to exercise their trades. In a

society of restricted opportunity in which men were trained for a definite occupation such covenants either deprived the worker of the means of livelihood, reducing him to a state of idleness, "the mother of all evil, otium omnium vitiorum mater," as it was said in the *Tailors of Ipswich Case* (11 Coke 53a), or promoted change, which was equally abhorred. With the transformation of the structure of English society in succeeding centuries a recession by the courts from this extreme view became inevitable.

The break came first in the case of agreements not to compete which were ancillary to the sale of a going business. By the eighteenth century restraints upon employees as well as sellers were permitted if reasonable. The rule of reason finds its origin in the leading case of *Mitchel v. Reynolds* [(1711) 1 P. Wms. 181]. Reasonableness was tested by the effects of the restraint upon the parties to the covenant and the public. If broader in space and time than the situation demanded or if its tendency was to establish a condition of monopoly, the contract was invalid. A dental apprentice could agree not to compete with his master in Nottingham; a covenant as broad as the realm was not allowed. Rules of thumb developed. Partial restraints, that is, agreements limited in area and time of operation, were lawful; general restraints, or agreements unlimited in time and space, were forbidden. But commerce proved to be no respecter of local or national boundaries. A partial restraint was scarcely adequate for the purchaser of a concern doing business throughout the realm or upon the continent. Even a general restraint might under certain circumstances be reasonable, a fact which many courts finally came to recognize. Since the *Nordenfelt Case* [(1893) 1 Ch. 630; (1894) A. C. 534], the spatial and temporal criteria are, by themselves, no longer controlling in England and in some states of the United States.

The rule of reason as applied was thus a fairly objective standard. By examining the major engagement to which the covenant was ancillary and the situation of the parties it was not difficult to appraise the restriction and to determine its necessity and probable effects.

In the field of employment restraints there has been a further shift in recent years. The rule of reason has been redefined. A restriction will be enforced only in cases where the employee has become acquainted with vital trade secrets or, through contact with customers, has become identified with the goodwill of the business. The

competition of a former laundry driver is evidently a danger to be avoided; but not the transfer of a foundry worker from the plant of the United States Steel Corporation to that of Bethlehem Steel.

To be contrasted with these ancillary restraints of trade are the familiar agreements directly and exclusively designed to eliminate or limit competition—agreements to fix prices, divide territories, apportion customers and restrict production. A question much mooted in judicial opinion is whether restraints of trade and restraints of competition constitute two separate categories or whether the latter are embraced by the former, being the species of which restraints of trade are the genus. According to the one view all restrictions on competition, whether or not in the form of agreements not to compete, are restraints of trade. As restraints of trade they are governed by the rule of reason and may be enforced if reasonable. According to another view restraint of trade is a term of art, signifying agreements not to compete. All agreements falling outside the sixfold classification of the common law are to be regarded as restraints on competition and thus are unlawful *per se*. Many courts, however, have paid little attention to these refinements of language. The terms restraint of trade and restraint of competition have been used interchangeably. To such courts the only issue to be considered is the applicability of the rule of reason. Most courts in the United States, regardless of the terminology adopted, have consistently held that all agreements not embraced by the sixfold classification are unenforceable.

The same divergence of opinion continued after the passage in 1890 of the Sherman Anti-Trust Act. This statute declared illegal "every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States, or with foreign nations." By a process familiar to judges, those who desired to uphold contracts not to compete while outlawing restrictions upon competition found the wording of the statute sufficiently flexible for the one purpose and adequately unqualified for the other. On the other hand, those who were suspicious of the allegedly beneficent effects of competition and were desirous of adopting the minority view of the common law were able to develop an elastic meaning of the term restraint of trade to accomplish their ends. By expanding the scope of the doctrine of restraint of trade they succeeded in

extending the field of application of the rule of reason. Both views were accompanied by an enviable display of erudition and both were equally unconvincing. For judges to pass upon the reasonableness of agreements directly restraining competition was, to Judge Taft, to set sail upon a sea of doubt. He could discover no instrument, save the subjective reactions of the individual judge, for measuring their legality. The formula which had been developed with almost mathematical precision for covenants not to compete could not be employed or duplicated in this alien field [*United States v. Addyston Pipe and Steel Co.*, 85 Fed. 271 (1898)]. Chief Justice White had no such yearning for certainty. He believed devoutly in the ability of judges to pass judgment upon the more novel restraints. Outvoted by his colleagues in the earlier decisions under the statute, he adhered to his views until 1911 when the *Standard Oil* case afforded him an opportunity to endow them with the sanctity of law (*Standard Oil Company of New Jersey v. United States*, 221 U. S. 1).

Since 1911 the Supreme Court has purported to apply the rule of reason to all types of restraints. But Chief Justice White's victory remained Pyrrhic for almost two decades. The restrictions to which the rule of reason had been inapplicable before 1911 were denounced as unreasonable thereafter. As one writer has put it, "the net effect of the rule of reason has been to add one sentence to every judicial opinion" (*Columbia Law Review*, vol. xxvii, 1932, p. 312). But at the hands of Justice Brandeis and Chief Justice Hughes the rule has been given a factual content and transformed into living doctrine [*Chicago Board of Trade v. United States*, 246 U. S. 23 (1918); *Standard Oil Company (Indiana) v. United States*, 283 U. S. 163 (1931), *Appalachian Coals, Inc., v. United States*, 288 U. S. 344 (1933)]. The standard enunciated will always, by its nature, be incapable of exact definition. But unless the law of the present is to be confined to the predetermined molds of the past, some such instrument of growth is imperative. Like all legalistic debates, the real issues have been obscured by verbalisms and sophistic arguments. Agreements and transactions affecting competition may assume a multitude of forms. To permit only those restraints which were upheld in the nineteenth century would be to shut the avenues to further development without necessarily promoting the social welfare. The rule of reason provided the flexibility essential for the further growth of doctrine. Another rule

might have filled the same role, but some such measure was indispensable. Whether judges are equipped by outlook or training to be entrusted with the responsibility for developing and passing judgment upon the rules governing industry is of course another and by far the more interesting question, but curiously enough it has been least discussed in the literature on the subject.

In continental countries the rules regarding contracts not to compete are not very dissimilar to Anglo-American law. The principle of freedom of trade, which was given currency by the French Revolution, has not deterred the courts from recognizing the legality of ancillary restraints of trade when reasonable as to time, place and circumstance. The attacks upon such restraints have usually been predicated upon the general provisions of the civil codes denouncing obligations against "good faith" or "good morals," and a considerable body of case law has developed. Employment restraints, because of the omnipresent danger of overreaching, have often been subjected to separate statutory regulation (see the amendments of 1893 and 1914 to the German Code of Commerce, the provisions of the Swiss Code of Obligations or the Austrian *Handlungsgesetz* of 1910). This separate treatment parallels the recent development of the law in England and the United States. Few civil or criminal restrictions are imposed by continental countries upon the creation of industrial combinations, as is evidenced by the great growth of cartels. The French Penal Code is exceptional in that it still contains provisions against combinations to raise prices, but even these have been emasculated by judicial decision. The present continental tendency is toward the regulation rather than the prohibition of industrial combinations.

specialized service adapted to particular credit needs and credit risks. In the typical case the consumer does not choose between borrowing cash and buying on time; if possible he makes his purchases on credit and when necessary seeks cash loans in order to pay overdue bills.

Two types of retail credit are usually distinguished. One is known as credit on open or charge account; the other, designated in retail practise by a variety of names, may be described as instalment credit. In the case of open account credit the only evidence of debt is an entry in the seller's books; generally no agreement is made as to the date of payment for each purchase, the buyer being expected to observe the customary trading terms, which may require settlement of the account at the end of each week, fortnight or month or at other specified dates throughout the year. In most instances no charge is made for the credit service; the credit customer purchases at the same prices as the cash customer, and the latter is not allowed a cash discount. In the case of instalment credit the buyer is under obligation to repay the debt in a fixed number of more or less equal instalments at regular intervals. The credit is protected not only by a written promise to pay but in many instances also by a power to effect the speedy repossession of the article sold on instalment if the obligation becomes delinquent or certain other terms of the contract are violated. A part of the purchase price is as a rule paid in cash or its equivalent when the buyer obtains possession of the article; special financing and subsidiary charges are added to the balance. The charge account is based on the assumption of a more or less enduring relationship between the customer and the store, but it calls for fairly frequent clearance of the accumulating debit balances. An instalment account, on the other hand, is usually opened in connection with the sale of a single article which may not be replaced for years, but it involves credit extension with a typical maturity of from 6 to 24 months. The instalment form of retail credit is best adapted to the marketing of expensive durable goods, which, however, may also be sold on open account to a selected clientele.

Retail credit represents for the most part credit extension to ultimate consumers. As such it is and always has been the major portion of consumers' credit. It is more easily accessible and more acceptable socially than cash credit for consumption; and in most instances its cost to consumers is less than that of borrowing from small loan institutions. Yet commodity and cash credit are complementary rather than competing forms of consumers' credit; each provides a

While instalment credit began to attract public notice only in the nineteenth century and did not come into real prominence until after the World War, open account credit dates much farther back. It seems to have been an integral part of the mechanism of commodity circulation in the agrarian stage of economic development,

when the bulk of the population realized income only once a year. Thus the mediaeval guild statutes and city ordinances suggest that retail selling on open account had wide currency in the fourteenth and fifteenth centuries and that even then measures were necessary to prevent its abuse. It did not abate appreciably thereafter, for a majority of the consumers continued to draw a living from the soil and city workers were paid at infrequent and irregular intervals. At the close of the seventeenth century Marperger, a German writer on trade, expressed alarm over the extension of retail selling on credit, and in 1673 a French edict required that bills be rendered by merchants and artisans within one year after sale. A century and a half later a Select Committee on the Recovery of Small Debts in England and Wales held that the great extension of credit was "an evil of considerable importance" (p. 9) and that, since tradesmen usually rendered their bills at the end of the year, it would not be unreasonable to refuse recovery of debts under £15 which had been outstanding two years or longer. Testimony before the committee indicated that selling on credit was more prevalent in smaller towns and among the smaller stores in large cities. The incipient differentiation between cash and credit retailing became more clearly marked in the course of the following century. This was connected with the successful establishment of consumers' cooperation, which regarded selling on credit as injurious to the interests of the working class, and with the later growth of capitalistic large scale retailing which emphasized price competition at the expense of collateral services to customers including the credit service. But neighborhood store keepers, small manufacturers and artisans who could not meet the prices or standards of larger and more efficient competitors were compelled to extend even more credit in order to retain patronage. At the same time the instalment business was established as a specialized although rather unimportant branch of retail trade. One type of instalment business was represented by stores which carried a wide assortment of goods for sale to working class housewives. These existed in London and the larger provincial cities of England as early as the first quarter of the nineteenth century; similar institutions, which, however, enjoyed a better reputation, were organized in France in the middle of the century and in central European countries two or three decades later. Another type of instalment business was carried on by

furniture and house furnishings concerns and by firms selling machines to industrial home-workers which through agents and canvassers extended their operations also to country districts; it was apparently these establishments that were responsible for the early legislative regulation of instalment selling on the continent.

Development in the United States followed similar lines. In the early stages, when little ready cash circulated in rural localities, when craftsmen and laborers in towns were paid no more frequently than once a month and even then in scrip or store orders more often than in cash, trading on account appears to have been widely prevalent. As late as 1838 H. C. Carey found that there were "few circumstances connected with the American Union more worthy of remark" than the "extensive and universal system of credit" (*The Credit System in . . . the United States*, Philadelphia, p. 25) which governed the trade between wholesalers and retailers and of the latter with their customers. But already in the 1850's Horace Greeley advised that "the true man of business" should "inflexibly set his face against any system of loose, general credit on goods purchased for consumption" (Freedley, E. T., *A Practical Treatise on Business*, Philadelphia, 1855, p. 159), on the ground that it led to extravagance. Recurring crises compelled the abandonment of long credits in wholesale trade with the consequent contraction of retail credit. This development was facilitated by the expansion and improvement of monetary circulation following the California gold discoveries and the establishment of the national banking system and by the adoption of weekly or semi-monthly wage payments in cash. In 1887 a committee of the American Economic Association concluded that the more experienced retail dealers were settling down to a cash basis, but this judgment was probably too optimistic. Data furnished by national banks a few years later indicate that only in 17 out of 37 states were average credits in retail trade shorter than two months, and that even in the 23 largest cities the average maturity for different branches of retailing ran from 1.1 to 1.4 months. It is clear nevertheless that the volume of retail credit was declining relatively if not absolutely. The Massachusetts Bureau of Statistics of Labor, which in the 1870's fought against the evil of store credits for workers, observed in 1906 that credit in ordinary retail establishments was extended almost entirely to the well to do. It reported also the appearance of instalment stores,

which in the United States followed the establishment of the instalment system in the sale of furniture and sewing machines. It is uncertain whether selling on open account sustained a relative increase after the World War, but it is generally agreed that there was a large and spectacular expansion in instalment credit particularly during and immediately following the industrial depression of 1920-21. Retail credit reached its greatest volume in 1929, when sales on open account amounted to \$10,300,000,000 and instalment sales exceeded \$6,500,000,000. According to the census of retail distribution 65 percent of the total retail business was transacted by stores which permitted credit sales; these constituted 52½ percent of their total sales. It was estimated that at the end of 1929 the consumers owed the retailers \$5,220,000,000, of which \$2,280,000,000 represented a debt on open account.

Differentiation between cash and credit selling and the establishment of large business units in retail trade has been accompanied by the rationalization of retail credit practise. For the rule of thumb judgment about prospective credit risks by the head of the store or its sales manager there has been substituted the specialized skill of the credit manager. He receives and solicits applications for credit, investigates the ability and willingness of applicants to meet their obligations, supervises collections and handles overdue accounts. In the final count it is the efficiency of the credit manager and of the department which he directs that determines whether the store obtains as much credit business as it can carry safely and whether the losses inevitably connected with it are reduced to a minimum. Thus he contributes substantially to the success or failure of the establishment, which, under modern conditions with a considerable proportion of the expenses represented by overhead, depends largely upon the volume of business.

The credit manager is assisted in his work by outside agencies which collect information bearing on the credit standing of applicants for charge and instalment accounts. Although the oldest of such retail credit information bureaus is said to have been established in London in 1803, their development has been particularly marked in the United States beginning with the 1880's. At the present time such bureaus are found in practically every town with a population of 25,000 or over; most of them are owned and controlled by merchants in the communities in which they are located and are affiliated with

the National Retail Credit Association, through whose Service Department the facilities of every bureau are put at the disposal of the membership throughout the country. Unlike mercantile credit agencies, retail credit bureaus do not as a rule issue rating books but operate on the principle of individual reports incorporating the most recent information supplied by members. In addition to this primary duty the bureaus have assumed a number of other functions: they are probably the most important instrumentality in suppressing credit frauds; many of them furnish some type of collection service; in some communities they arrange for joint action in adjusting particularly bad cases of overindebtedness; and in others they have featured educational campaigns urging "prompt pay."

Little is known about the total cost of retail credit extension. While the cost of credit to the instalment purchaser can be measured by the financing and other charges imposed on him, the open account buyer is generally treated in the same manner as a cash customer; the cost of the credit service which he obtains is included in the price mark up and thus diffused among the entire clientele. This cost comprises three distinct elements: the cost of money tied up in receivables, the loss arising from bad debts and the office expense connected with credit extension. While the first two can easily be ascertained from ordinary accounting records, it is difficult to deal with the last item because in many establishments all of it and in all some of it is treated as part of the general overhead. In the United States data bearing on the first two have been made available for various retail branches by trade associations, bureaus of business research and similar bodies. In 1928 a national retail credit investigation was carried out by the Department of Commerce; it covered a sample of stores in 27 retailing lines and furnished, in addition to other information, collection and bad debt loss percentages for open and instalment credit accounts. Beginning in 1930 the department has conducted semi-annual surveys on a somewhat abridged program for a much smaller coverage (7 lines through the first half of 1932, and 8 lines thereafter). The data thus obtained on the average maturity of retail credits and losses connected with them are summarized in the accompanying table.

Retail credit has been criticized both as a form of consumers' credit, encouraging extravagance and overindebtedness and accentuating the amplitude of cyclical fluctuations, and as credit

issued by retailers, who do not specialize in granting it and may be tempted to sell credit terms rather than merchandise quality or price. It should be observed, however, that up to a certain point retail credit is properly articulated with the mechanism of income circulation; as long as the flow of incomes to consumers is not continuous but occurs at weekly, monthly or quarterly intervals, it is to be expected that the disbursement of income by consumers will follow a similar pattern. Again, to the extent that retail credit is used to reduce customer turnover it promotes efficient and rational organization of retail trade. And if retail merchants are not as careful as small loan institutions in the investigation of risks and the proper allocation of costs, this is accounted for in part by the fact that both risks and costs are on the average much smaller in retail credit than in cash credit to consumers.

"Merchant credit," or "store credit," to farmers is quite distinct from retail credit to urban consumers. It is largely production credit and its primary function is the financing of agriculture. The cost of such credit is usually high, in the United States no less than 15 or 20 per cent per annum. It is used by some farmers solely because they are not able to borrow elsewhere. They require a credit service which banks are not prepared to provide or cannot supply profitably at the rates of interest usually charged by such institutions. In European countries, notably Germany, Italy and Ireland, the acuteness of the situation has been mitigated by the establishment of rural credit cooperatives. Although some effort has been made to transplant this system into the United States, it has

failed to take root in the short term credit field, and merchant credit is still prevalent in certain sections, particularly in the south. In emergencies caused by bank failures, crop failures or poor prices it becomes indeed the major form of farm credit. Merchant credit imposes a severe penalty on the borrower who meets his debts because indirectly he pays the bad debts of others; and it encourages careless financial management on the part of both the farmer and the merchant. But, as a recent study suggests, graduation from store to bank credit requires not merely a change in financial practices but a reform in the type and methods of farming—less reliance upon a single cash crop, diversification with a view to making the farm more self-sufficient or an increase in the size of the farm unit.

RETAIL TRADE. Retailing is that phase of general commerce devoted to the distribution and sale of goods to ultimate consumers. It includes the sale not only of merchandise but also of services incidental or necessary to the use of such goods. The term is not usually applied, however, to businesses engaged in selling nothing but services, such as public utilities, or to such businesses as laundries, barber shops and undertaking establishments or to the professions that serve consumers, such as banking, pawnbroking, dentistry, medicine and law. The distinguishing feature of the retail trade is that its business consists in selling merchandise to ultimate consumers. Its transactions may be effected in the consumers' homes or places of business, by mail, by telephone or, most commonly, in retail shops or stores.

Retailing is certainly the most widespread and probably the oldest form of trade. It existed in one form or another in every ancient tribe or nation of which there is any record and must have been important even in prehistoric ages. Artifacts of these ages, such as tools, weapons

and ornaments, known from their raw material to have come from very limited areas, have been discovered over entire continents; such distribution could be accounted for only by pillage and war or more probably by some form of peaceful exchange or trade.

In the earliest known historic periods, 2000 B.C. or earlier, there was a well defined retail trade; towns were full of shopkeepers; peddlers and traders were in constant movement from community to community. Back of such retail trade there must have been some sort of wholesale, import and export trade as well. Despite the importance of trade shopkeepers were as a rule held in low repute. Traders were lower in the social order than those occupied with politics, religion, military life or even agriculture. Moreover traders and shopkeepers were generally considered dishonest and immoral. Indeed the Greek and Roman deity of trade, Hermes, or Mercury, was likewise the god of thieves and pirates. There are students who believe that this points to the origins of trade in piracy and loot. In all probability many of the early traders were not above making a profit through sharp or shady deals, but there are many accounts and descriptions of business carried on at high levels of morality.

During the periods of prosperity and power of the Greek city-states and later of the Roman Empire retail trade, in common with commerce in general, developed to a very high point, not only as to forms and types of shops and methods of trading but also in extent and volume. Small shops were the rule. Goods were offered for sale in booths, on porches or in outer rooms facing the streets. The arrangements and displays of goods were probably much like those found in the shops or bazaars in the Orient today. The shopkeeper usually lived in the room or rooms back of his shop or on the floor above. The shops themselves were presided over by the proprietor and his wife, with the occasional help of children or of a slave or two. There was certainly a well established consumer interest in shopping, and retail trading sections of the larger cities must have had their daily crowds.

Men's and women's apparel, millinery, footwear, jewelry, perfumes and home furnishings were subject to fashion changes, and Rome in the days of the empire was the center of the fashion world. People of the most distant lands followed these fashions as closely as they could through the reports of travelers and couriers. Indeed there seems to have been a trade by

messenger and post comparable to the present mail order business. Professional shoppers residing in Rome served wealthy clients living in other parts of the empire by making purchases for them in such lines as apparel, jewelry and furnishings. It is difficult in fact to point to any type of retail institution or service—chain stores, department stores or specialty shops—which did not have more or less well defined beginnings in ancient Greece and Rome.

During the fourth and fifth centuries, when the Roman Empire went to pieces, retail trade declined along with commerce of all kinds. From 500 to 900 A.D. such trade as existed in western Europe was carried on by barter, through fairs, in primitive market places and by travelers and itinerant peddlers, generally without the protection of law. Many of the traders of this period carried their wares, such as eastern made fabrics, laces, jewelry, perfumes and spices, in packs on their backs or secreted in their clothing and thus traveled from castle to castle.

By the tenth century regularized channels of trade again appeared, particularly in the growing towns of Italy. The old market places were reopened, periodical fairs came into existence, shopping centers began to be established and traders dealing in consumer goods multiplied. By the fourteenth century trade had become a highly important activity in nearly every western nation. Societies of traders as well as of craftsmen had appeared and mercantile institutions assumed important places in economic life. As a consequence the merchant and trader began to rise in social as well as economic standing. Retail trade expanded in number of shops, in number of persons employed, in volume of business and in importance. The primitive forms of trading with consumers gave way to modern forms; peddling and periodical fairs were gradually displaced by established, permanent retail shops.

The eighteenth century saw the peak of the development of the small retail shop, specialized to handle individual lines of goods and designated by the lines carried. Thus there were fruiterers, greengrocers, butchers, wet salters, costermongers, cheesemongers, fishmongers, drapers, mercers, tailors, cobblers, hatters, ribboners, perfumers, jewelers and so on. By 1725 there were said to be more than 6000 retail shops in London alone, and in 1727 Daniel Defoe estimated that not fewer than 2,000,000 people in England were either directly or indirectly dependent upon retail trade for their living.

These multitudes of small shopkeepers no longer themselves made the goods that they offered for sale but purchased them from wholesalers, who in turn bought and gathered them up from small hand producers scattered all over the country and transported them by pack trains and wagons to great city warehouses, where they were again sold and shipped to the retailers. Traveling salesmen, then called chapmen, selling from sample, found their place in the commercial system. Credit terms were standardized and retail resale price maintenance seems to have been in effect in many lines. Even the fixed, or one-price, system, believed by many to be of recent origin, was employed by English retailers as early as the first quarter of the eighteenth century. Another phase of the art of shopkeeping that characterized this remarkable period was the development of a distinctive retail shop architecture, including very attractive store fronts, effective window displays, highly artistic signs and clever use of lighting by the means then available.

In North America the evolution of trade in general and of retailing in particular followed of necessity somewhat different lines from those of Europe. The prehistoric Indian trade which existed before the arrival of white men gave way to the trading post period, in which commerce was carried on between white traders and the native Indians, generally on a basis of barter. With the beginning of white settlements there arose a type of retail trading establishment, the general merchandise store, which carried a wide variety of all sorts of simple necessities for the early settlers. This in turn slowly gave way to single line shops, much like those that existed in England and other European countries throughout the eighteenth and nineteenth centuries. From this stage onward the development of retail trade in America has been similar to that of other and older countries. Within the past generation a new factor has appeared in retailing everywhere but particularly in the United States; namely, the growth of large scale enterprise involving the use of extensive capital and exemplified in such institutions as department stores, mail order houses and chain stores.

Each of these early developments of trade has left its impress on present day institutions. There are still trading posts in the wild, unsettled regions of the northwest. There are still thousands of general merchandise stores. The small specialty shop is still the dominant form of retailing in the United States as well as in most

other countries of the world. The place taken by the newer forms of retail organization, the department stores, the mail order houses and the chain stores, will be discussed in further detail. Altogether the consumer is served today by a greater variety of shops and a greater diversity of methods of selling than ever before.

Retail establishments may be classified in various ways. Thus a classification may be made according to the principal line of goods carried, such as food, general merchandise, automotive supplies, apparel and others. Each of these classes may again be subdivided; thus food stores include groceries, meat markets, fruit and vegetable markets, delicatessens, dairy product stores, confectioneries, bakeries and so on. Classification may be based on services rendered, these ranging from automatic vending through self-service, cash and carry, limited service and full service. A classification by type of ownership or control would include the independent unit stores owned by individuals, partnerships or corporations, branch store systems conducted as subsidiaries to parent retail stores, manufacturers' outlets, industrial stores conducted as conveniences for industrial employees and their families, chains, or multiple stores, and consumers' cooperative stores. One of the interesting variations of the chain store method of control is the so-called voluntary chain, most frequently an organization of retailers combined by contract or understanding with a wholesaler to carry on more or less in the same way as a regular chain. There are also groups of retailers, either with or without wholesale resources, functioning as independent groups in competition with the regular chains. If interest centers in the territory served, retail stores are usually classified as metropolitan, suburban, neighborhood, village and country crossroad stores and also curbside or roadside markets and stands. Retailing is under constant change and new types of retail establishments are constantly coming into existence, while others are passing out. Often the new factors serve new

consumers' requirements without actually forcing any of the older forms of institutions out of business.

The extent of retail trade and the amount secured by department stores, by chains and by cooperatives in each of the four largest western countries are shown in the accompanying table. For countries other than the United States the only figures available are more or less rough approximations.

The completion of the United States Census of Distribution for 1930 makes it possible to present a detailed picture of retail trade in that country. In 1929 there were, in round numbers, 1,500,000 retail establishments with total annual sales for the year of almost \$50,000,000,000. There were more than 6,000,000 people engaged as owners or employees in the retail business, amounting to 4.9 percent of the total population, or approximately one eighth of the total number of persons gainfully employed. The total annual pay roll amounted to more than \$5,000,000,000 and the average annual salary per full time employee was \$1312. Of the total number of persons engaged in retail trade an average of about 14 percent were part timers. The proportions of men and women employees were respectively 68 percent and 32 percent of the total, but varying from about 50 percent and 50 percent in apparel shops to 93 percent and 7 percent in the automotive trades. Retailers owned the premises occupied by their businesses in only 28 percent of the retail establishments of the country. Nearly half of all the retail stores were on a strictly cash basis, but their sales amounted to but slightly more than a third of total sales. In this characteristic, as in most others, there was a wide variation among stores and particularly according to goods handled. Credit sales were far above the average in automotive goods, home furnishings, lumber and building materials and generally below the average in lines of low unit sales values.

As already indicated, one of the striking characteristics of retail trade is the large proportion of

RETAIL TRADE BY COUNTRIES AND TYPES OF CONCERN, 1929

COUNTRY	NUMBER OF RETAIL ESTABLISHMENTS	VOLUME OF RETAIL SALES (in \$1,000,000)	PER CAPITA RETAIL SALES	PERCENTAGE OF DEPARTMENT STORES	PERCENTAGE OF RETAIL TRADE DONE BY CHAIN STORES	PERCENTAGE OF RETAIL TRADE DONE BY CONSUMERS' COOPERATIVES
United States	1,543,000	50,000	\$407	7.90	21.90	0.15
Great Britain*	778,000	13,300	291	4.00	14.00	8.20
Germany	788,000	8,750	167	5.00	1.00	4.00
France*	1,600,000	7,200	175	6.00	5.00	0.73

small concerns. The average sales of all retail institutions in the United States in 1929 amounted to \$32,000. Only 22 percent, however, of all the retail establishments in the country enjoyed sales of as much as or more than this amount. Less than 25 percent of all the stores in the country did more than 75 percent of the total retail business, while 1 percent of the stores, including the largest establishments, those with sales amounting to more than \$300,000 annually, had 25 percent of the total business of the country. Half of the stores had sales of less than \$12,000 annually, with an average of only \$5500. There were in 1929 only 2059 stores which had sales volumes of more than \$1,000,000 a year. Indeed small retail establishments constitute the majority of retail institutions the world over. In spite of the trend toward large scale retailing there is little to indicate any real decline in numbers of small dealers or in the actual volume of business they transact.

Of the new large scale forms of retailing the oldest is the department store. The department store is usually defined as a retail establishment carrying many lines of merchandise, including apparel and accessories for women and children, small wares, usually dry goods, and often home furnishings, each of these lines segregated and departmentalized not only in location within the store but also in operations and records. The department store is literally an organization of several shops, or stores, carried on under one roof and under one management. The stocks of each department are handled as if each were a separate store, but the operations of accounting, advertising, delivery, personnel and general management are usually carried on in a centralized way for all merchandise departments.

The department store of this kind is of distinctly modern origin. There were, to be sure, many previous instances of the operation of several shops under one roof. During the eighteenth century and earlier there were in various European centers buildings fitted up to hold several shops, but in all of these cases, so far as known, the building was operated by a landlord who merely leased space to independent shopkeepers. The department store with its shops integrated under one ownership and management appeared almost simultaneously in several western countries shortly after the middle of the nineteenth century. The Bon Marché of Paris, generally credited as being the first, was founded in 1852 by Jacques Aristide Boucicaud. Three

years later in 1855 the Louvre, the second department store, was established, and in 1865 the Printemps was founded. The spectacular progress of these establishments attracted the attention of ambitious retail executives in all parts of the world. Retail institutions that had been dry goods or other types of stores took on more and more lines and in a few years became department stores. This appearance of the large entrepreneur in a field so generally regarded as that of the small merchant aroused hostility and opposition, particularly in Germany, where one of the demands of the middle class movement of the late 1890's was for legislation to curb the growth of department stores. Opposition, however, was in vain.

Department stores in the United States appeared in the 1860's. A. T. Stewart & Company of New York was probably one of the earliest to institute definite department store organization and operation. Others followed so quickly, however, that it is difficult to determine their order of precedence. Department stores spread and grew rapidly throughout the late 1890's and the early years of the 1900's, but more slowly from 1908 down to 1914 or 1915. With the impetus given to trade by the World War they again pushed forward. There was some check in growth during 1920-21 because of the business depression, but from 1922 department stores continued to grow until 1926 and 1927. Prior to 1929 there began to be indications that department stores, taken as a class, had almost reached a point of maturity. During the five years ending in 1930 very few new establishments came into existence and many if not most of the older concerns experienced a slowing up of sales increases. The business depression beginning in 1929 drove their sales volumes down precipitously.

By 1929 the total number of department stores in the United States, according to the Census of Distribution, amounted to 4221, less than .3 percent of the total number of retail establishments; and their sales volume for the peak year of 1929 amounted to \$4,350,097,000, or just under 9 percent of the total retail trade of the country. In arriving at these figures, however, the Census of Distribution arbitrarily limited the term department stores to retail establishments with annual sales of \$100,000 or more exclusive of food departments and included only those that carried men's goods, furniture and house furnishings as well as women's and children's goods. Clearly many

retail establishments counted by their owners or managers as well as others as department stores were not included. A more liberal application of the term in accordance with popular usage would have included all departmentalized dry goods stores, general merchandise stores and general stores. The combined volume of these classes of stores with those actually counted would probably have amounted in 1929 to as much as 14 percent of the total trade of the country.

While there are great differences between them, department stores usually exhibit certain common characteristics. They are ordinarily centrally located in the retail trading or shopping districts of large cities. They sell merchandise of many kinds and at price lines appealing to the masses rather than the classes, with highly developed services for consumers, such as free deliveries, the utmost liberality in exchange privileges and guaranties of satisfaction; with a few notable exceptions most department stores accord charge account privileges to their customers. Department stores are nearly everywhere large users of advertising. In the United States the daily newspaper is the customary medium for such publicity. Department store advertising has contributed in large measure to the successful development of the modern daily press, and correlatively the existence of newspapers with large but concentrated circulation has made the department store possible. Department store operation is usually characterized by high operating expenses, as for rent, advertising and delivery over a wide area. The modern department store has carried the principle of division of labor, specialization and organization farther than has any other type of retail establishment.

Mail order retail trade is as old as the postal systems of the world. Well known retail establishments, located in important retail trading centers, have always enjoyed a certain amount of trade with out of town customers. But it was not until after the rapid expansion of population over widening territories in the United States, Canada and other new countries that the mail order business as such began to be capitalized and established on its own basis. The earliest extensive, wide scale purely mail order developments in the United States seem to have resulted from experiments with advertising placed in the popular magazines that began to appear in the period from 1850 to 1875. During the late 1860's and early 1870's a number of concerns appeared,

specializing in mail order selling of novelties, books, pictures and so on. The first general merchandise mail order concern was established in Chicago by A. Montgomery Ward in 1872. Its original purpose seems to have been to attempt to supply the merchandise requirements of the rapidly spreading farmers' cooperative organizations. Shortly thereafter Ward set out to develop a direct mail order business with farmers and small town people throughout the United States and succeeded in building an organization which was for many years not only the first but also the largest retail mail order business and which is today the second largest concern in this field.

Sears, Roebuck & Company, now the largest retail mail order concern in the United States, came into existence in 1886 in Minneapolis, Minnesota. Richard W. Sears, a railroad station agent located in a small village in the northern part of the state, had sold a few watches during spare time and saw the possibilities of expanding a watch and jewelry business for customers living in the country and in small towns far removed from the large trading centers. He established his first venture as a mail order watch business. A year later he was joined by A. C. Roebuck, a watch repair man. In 1890 the firm moved to Chicago and shortly thereafter sold out. Three years later the same partners established a new concern in Minneapolis, but added a number of other lines of merchandise and published a large catalogue describing these various goods. These catalogues, issued twice a year, were for some time successfully sold at a dollar each to farmers and villagers throughout the middle west. In 1895 this new concern moved to Chicago. The A. C. Roebuck share in the business was taken over by Julius Rosenwald, who later became the president and directing genius of the company.

Numerous other mail order concerns, not only in the United States but elsewhere, sprang into existence during the decade preceding 1900. The T. B. Eaton Company of Canada started as a small store in 1869 and gradually expanded not only into a chain but also as a great mail order house, so that by 1929 it had become the largest retail mercantile establishment of the British Empire. The mail order method also came into increasing use in a specialized way in the sale of many classes of goods, particularly books, periodicals, pictures, music and musical instruments, jewelry, nursery stock, educational correspondence courses and so on. For a number

of years preceding the World War period the mail order method was successfully used by many of the leading department stores. Large catalogues were regularly issued and a considerable volume of business was transacted.

The exclusively mail order establishment as a retail institution seems to thrive best in new and rapidly developing countries. It was particularly effective during the late nineteenth and the early part of the twentieth century in the United States, the Dominion of Canada and Australia. While a considerable volume of mail order trade exists and has always existed in the older countries, particularly in Great Britain and France, this trade developed as a part of the business of well established retail stores and not as an exclusively mail order business.

During the years following the World War department stores found increasing difficulty in conducting a mail order business. Consumers' requirements, particularly for style goods, had become more exacting than in pre-war years and the costs of operation exceeded any possible gross profits attainable. Department stores generally discontinued the issuing of catalogues, and many mail order specialty houses passed out of existence. By 1929 the mail order business had become but a fraction of what it had been in earlier years.

The factors that contributed to the early success of the mail order business, such as a widespread country population without adequate shopping facilities, have greatly changed. The development of good roads and the increased use of automobiles have given hundreds of thousands of families access to towns and good stores. Despite the efforts made by the mail order concerns to render a continuing satisfactory service the desire of consumers to shop and see the actual goods before purchasing has led to the decline of the mail order trade and to an increase in the regular retail trade in large shopping centers. To meet this decline the larger mail order concerns, more particularly Montgomery Ward Company and Sears, Roebuck & Company, began some years ago to establish chains of regular retail outlets. At the present time both organizations have so many retail stores as to rank well up among the largest chain store organizations of the country. More than half of the sales now reported by each of these two concerns are from their retail stores rather than from their mail order trade.

The term chain stores, or multiple shops as they are known in England, is applied to retail

establishments combined and operated under one ownership and management. Chains differ from branch store systems in that in the chain each unit, entirely apart from every other unit, is conducted from a central office while branch stores are stocked and operated from a central or parent store which serves as headquarters.

Technically there is the beginning of a chain whenever two or more stores are united under one ownership and management in the manner indicated above. Characteristic chain store operations do not appear, however, until there are a considerable number of units. The Census of Distribution of the United States, faced by the necessity of distinguishing chain stores from ordinary independent stores and branch systems, arbitrarily set a limit of four stores as a minimum number for classification in the chain store group. All groups of four or more stores, excepting branch systems, were classified as chains.

The chain store type of operation has had many forerunners. There are records indicating central ownership and management of retail shops in ancient Greece and Rome. For example, an inscription which was evidently a poster or advertisement, appearing on a wall of a building in Pompeii, destroyed by Vesuvius in 79 A.D., offered a five-year lease on property including 900 retail shops. There are said to be records of a Chinese business man, On Lo Cass, who owned a chain of a great many units in the Celestial Empire as early as 200 B.C. Jacob Fugger of Augsburg, Germany, in the fifteenth century established a chain of industrial enterprises, including wholesale and even retail shops. In 1643 the well known Mitsui organization of Japan began as a chain of apothecary shops. In 1670 the Hudson's Bay Company was chartered by the British crown and it continues today as the oldest existing chain store organization in the western world, with more than 250 trading posts and 10 modern department stores scattered through the Dominion of Canada. Somewhat more than a hundred years ago a well known chain of shoe stores in Brazil, the Campanhia Calcado Clarke Company, came into existence. Throughout the nineteenth century there was considerable chain activity. It was not at all uncommon for wholesale houses during the 1840's, 1850's and 1860's to own and control retail outlets either secretly or openly. Among New York wholesalers of that period who owned retail stores were A. T. Stewart and Lord & Taylor. During the 1870's John Wanamaker,

with his large department store in Philadelphia, attempted to conduct several men's clothing shops in various other cities. H. B. Claflin & Company and Carson, Pirie, Scott & Company, both dominant wholesalers, at one time had several retail outlets.

Of the definite retail chain store systems now in existence in the United States the Great Atlantic & Pacific Tea Company is the oldest. It was established in 1859 and has functioned as a chain store organization throughout the entire intervening years; it now has more than 15,000 unit stores scattered over the country, with total sales approximating \$1,000,000,000 or more per year.

While many chain systems came into existence prior to 1900, the major development took place in the years immediately following the World War. Large scale enterprise, the fashion in every line of industry and finance, showed itself, in the field of distribution, in chain stores. In the ten-year period ending in 1929 retail trade increased probably 40 or 50 percent, but chain stores spread so fast that their sales must have quadrupled in these same years. Chain store organizations have appeared in nearly all parts of the world. There has been a marked development in Great Britain, in the Dominion of Canada and in other parts of the British Empire. Their growth was particularly rapid in the German Reich prior to 1929.

By 1929 about 10 percent of all the retail outlets in the United States were chain stores, using the term in the restricted sense employed by the Census of Distribution. According to that census there were more than 7000 chain store organizations with total sales for the year 1929 of \$10,740,000,000, amounting to 21.9 percent of the total retail sales of the country. Out of a total of 159,638 chain store units, 52,465 were classified as local chains with aggregate sales of \$3,293,800,000, amounting to 6.7 percent of total retail sales. Sectional chains operated 41,083 stores, with sales of \$2,191,000,000, equivalent to 4.46 percent of total retail sales. National chains operated 51,058 stores, with sales of \$3,060,000,000, equivalent to 8.06 percent of total retail sales of the country. The total of 21.9 percent was made up by the addition of other chain store systems, including manufacturer controlled outlets, utility operated retail organizations and leased departments.

The proportion of chain store sales to total retail sales varied greatly according to kinds of business. For example, among stores handling

household appliances exclusively, chain stores accounted for slightly more than 50 percent of total sales; similarly, in stores selling only footwear chain stores enjoyed 45.7 percent of the total volume. In other lines, however, such as motor vehicles, restaurants and lunch rooms, hardware, jewelry and many others, the chain store volume fell below 15 percent of total sales. In the food group chain store sales amounted to 29 percent of total retail sales, in general merchandise 33.5 percent and in apparel 28.2 percent. These wide variations and uneven developments may be explained partly by the recency of the movement but perhaps better by differences in the difficulty of operation of chain store systems in these different fields. It remains to be seen whether chain store operation may be applied with equal success in all lines of retailing.

The business depression beginning in 1929 checked the sales progress of chain store organizations as well as of independent and other types of retailing. It quite definitely stopped the rapid growth of chains through mergers and other methods of accretion. It also remains to be seen whether the chain store idea may again develop at the rapid rates of the years preceding the depression.

Chain store operation has shown several advantages as well as some weakness, as compared with other systems of retailing. Some of the advantages, such as multiplied buying power, systematized standards and consequently economized operations and also the employment of the most expert overhead management, are inherent in the chain store method of operation. In many respects the chain stores prospered because of their prompt adoption of effective operating policies which, although open to other retailers, had not been generally applied. The chain stores were very prompt in seeking the best locations. They generally offered goods with limited services and consequently lower prices. They specialized on the most wanted and most popular lines of goods. They instituted better lighting and higher standards of cleanliness than were commonly found in most retail establishments.

On the other hand, chain store systems undoubtedly have had certain disadvantages. They are faced with the difficulty of securing flexible operation to meet the practical requirements of individual communities and customers; there has been lack of local management interest such as arises from individual ownership; there has always been and there still exists a strong an-

tipathy toward chains among local business interests—wholesalers, manufacturers, newspapers and others as well as retailers—who resent the intrusion of a chain operated from some distant headquarters; there is the growing competition of chains with chains; and, finally, the difficult problem of meeting antichain feeling in the form of adverse legislation, especially differential tax legislation.

Consumers' cooperative stores are distinguished from other forms of retail enterprise by the fact that their ownership is vested in a society, association or corporation made up of customers, or consumers, rather than of private business individuals or groups. Consumers' organizations are usually incorporated, but in accordance with certain well known principles of cooperative management the distribution of profits is based on the amount of purchases rather than on the amount of stock owned or capital contributed. Membership is usually open to all consumers by payment of a small fee, which constitutes each member's contribution to the capital of the concern. Consumers' cooperative retail establishments have generally found it wisest to sell their goods to their members as well as to others at current market prices, rather than to attempt to sell at cost or at cost plus expenses. Most consumers' cooperatives are also conducted on a cash and limited services basis, and consequently expenses of operation are kept down by the elimination of charge account and delivery operations. It has usually been found necessary, as a means of keeping enthusiasm and participation alive, to conduct for the members a more or less continuous education in the principles of and the necessity for cooperation.

There are many forms of consumers' cooperative retail establishments. They vary from temporary buying clubs, organized to make group purchases or to secure discounts, to well established retail stores. In several countries these local groups are still further organized for the ownership and control of wholesale societies and even of manufacture.

Consumers' cooperative retail establishments may be found in nearly all countries in the world but have been most strikingly successful in England, Scandinavia, Germany and Russia. The consumers' cooperative movement has made many beginnings in the United States and Canada but has so far not been able to obtain any large percentage of total retail trade. The movement is particularly weak in Italy, Spain

and other Mediterranean countries. Its highest development is to be found in Soviet Russia, where cooperatives constitute the principal channels of consumer trade.

The objects of consumer cooperation are usually to reduce the costs of distribution and to save the profits of the retailers for the benefit of the consumers themselves. Consumers' cooperatives have in some countries been instrumental in securing honest weights and measures. They have often led in attacks on burdensome trade regulations and have invariably appeared whenever monopolies threatened in the distribution field. In consequence consumers' cooperatives have made the most rapid strides in communities in which the older forms of retail trade have been backward, burdensome or arbitrary. They stand in most western countries as a potential challenge to ineffective retailing carried on by other types of organizations.

One aspect of the retail trade, as of marketing in general, which has attracted increasing attention in all countries of the world in recent years is the increasing costs of operation. For the United States expenses of retail operation, taking an average of all lines, account for close to a fourth of the sales price to the consumer. Expenses of operation within the various types of retail establishments vary considerably as a result of differences in the amount of handling required, in amounts of capital invested, in risks involved and in other services. The lowest operating expenses are as a rule to be found in those types rendering the fewest services and handling the goods with the most rapid turnover and with the lowest capital investments. Establishments handling staple, non-perishable food products, purchased constantly by the consuming public, are of this kind. It is not unusual to find retail establishments in the food field successfully operated on expense margins of 10 percent or less of their retail sales. The highest operating expenses are to be found in retail establishments required to render a great deal of service, as, for example, in organizations handling jewelry, automotive supplies, fitted apparel, home furnishings requiring careful selling, optical supplies, cut flowers and similar goods and in prescription departments in drug stores. Department stores and other general retail establishments which carry many lines of goods incur the expenses of each, so that the overall operating expenses of such establishments are in most cases simply averages of the operating expenses of the various departments

included, ranging from 25 percent to 36 percent of sales.

The principal items of expense in retail operation are salaries and wages, rents, advertising, supplies, fuel, water, power, light, taxes and insurance, traveling and communication. Of these, salaries and wages are by far the most important, making up more than half of average total retail expenses. Rental approximates a sixth of total expenses of operation, while the remaining third goes for all of the other expenses listed above.

The expenses of operation in retailing have undergone and are still undergoing marked changes. There are at the present time several fairly distinct trends. In retail stores of various sizes, selling the same kinds of merchandise and offering about the same kinds of service, expenses of operation tend, up to a certain point, to decline on passing from very small to larger stores. Thereafter on passing to larger and larger stores there is a definite tendency for expenses to increase. This is quite contrary to popular views that increases in sales tend to reduce operating expenses. As a matter of fact in retailing, after certain sales levels have been reached, increases in volume apparently are followed by increases in expenses, not only absolutely but relatively as well. Retail operating expenses in the same type of stores, offering the same services, are generally lower in smaller towns and higher in larger cities. Similarly, operating expenses tend to increase on passing from stores in neighborhood and suburban centers to central locations in the same cities. There are fairly definite differences in operating expenses in various geographical centers. Generally speaking, in the United States the lowest are found in the south and middle west, the agricultural areas, while the highest are found in the east and northeast, the industrial and commercial centers of the country.

Retail operating expenses have shown a rising tendency over a period of many years. For example, department stores in the United States maintained operations in the 1890's at expense rates amounting to less than 20 percent of net sales. This expense rate had increased to 25 percent by 1914. During the World War period, from 1914 through 1918, operating expenses either remained the same or actually declined. Following the World War an upward trend of expenses again occurred, so that by 1929 the average expense rate in American department stores had passed 30 percent. The inclusion in

the Census of Distribution figures of reports from many small establishments disguises the extent of the rise in expenses for typical department stores, resulting in an average of 26.74; the figure of 32.8 percent compiled by the Harvard Bureau of Business Research is more nearly representative. Following 1929, throughout the business depression, expense rates increased still more. Intensive efforts have been made for years to curb these increases in operating expenses but without avail. It is probable, however, that if the efforts had not been made the expenses might have gone considerably higher. It seems likely that the predepression expense rates may again be established, but there is nothing to indicate as yet that the end of this long term trend of increasing retail expenses has been reached.

RETALIATION. *See* REPRISALS; TARIFF.

RETORSION. *See* REPRISALS.

RETROACTIVE LEGISLATION. The principle that laws should not apply to events which occurred before their passage dates at least from Roman times. Cicero berated Verres for making retroactive a provision of the *Lex voconia* and the Justinian Code repeated a prohibition of retroaction as settled law (bk. 1: 14, 7). Bacon (*Maxims*, Reg. 8) and Coke (2 *Inst.* 292) established it as an ancient maxim of the English common law long before Blackstone wrote his condemnation of ex post facto laws.

The provisions in the United States constitution forbidding both federal and state governments to pass any ex post facto law (art. i, sects. 9, par. 3, and 10, par. 1) had indigenous precedent in the Maryland, North Carolina and Delaware constitutions of 1776 and the Massachusetts constitution of 1780. At the Constitutional Convention many delegates believed such provision unnecessary; but caution triumphed over faith, and the prohibition of retroactive laws has become a standard clause for constitutions. In the United States almost all state constitutions ban ex post facto laws, as do the constitutions of France, Mexico, Norway, Portugal, Chile and Brazil. The German constitution of 1919 contains a similar clause; but this did not prevent the National Socialist government in 1933, in the famous Van der Lubbe case, from retroactively changing arson from a non-capital to a capital crime. Since the *Code Napoléon*, codes in civil law systems admonish the law administrator, if not the lawgiver, that laws are to have only a prospective effect. The canon law boasts of

similar rectitude. In English law, where Parliament is avowedly not restricted in its power to pass retroactive legislation, the judges have for centuries reiterated that no legislation should be interpreted retroactively "unless the intention of the legislature that it should be so construed is expressed in clear, plain, and unambiguous language."

The United States Supreme Court, in its first case interpreting the term ex post facto law, held that it was used in a technical sense embracing only retroactive criminal or penal laws [*Calder v. Bull*, 3 U. S. 386 (1798)] and was intended as protection against bills of attainder and similar legislation with which the framers were familiar not only from English but also from recent colonial history. This restrictive interpretation has been consistently followed with regard to both federal and state constitutions. Its accuracy, however, has been questioned by some, who cite instances prior to the constitution of a broader use of the term. It has been suggested moreover that in inserting this provision into a constitution otherwise barren of a bill of rights the framers were thinking "more of contracts and paper money" than of oppressive criminal legislation. The records of the Constitutional Convention yield little evidence, however, upon which a confident opinion may be based.

The controversy has been rendered academic by the later development of the due process clause to prohibit all "unreasonable" retroaction. The more limited ex post facto or contract clauses may now be regarded simply as encyclopaedic subdivisions of the due process clause. Eight state constitutions expressly prohibit retroactive civil laws as well as ex post facto laws, but there is no evidence that private property is safer from legislative impairment in those states than in the others.

Not all retroactive civil legislation is invalid, however, either under the express constitutional interdict or under the amorphous due process clause. Change is inevitable and cannot be made without upsetting some interests, plans, expectations or inchoate transactions. Characteristically, the courts have not developed any acid test for differentiating the permissible from the non-permissible retroactive laws. The latter are condemned as "arbitrary" interferences with "vested rights," as "unreasonable" impositions of duties and obligations on the basis of past events, as "unjust" deprivations of substantial defenses which had fully matured under the

previous law. Those which are given judicial sanction are termed changes of legal remedy, not right; changes in procedure, not substance; "curative" of "technical defects," "informalities," "irregularities" or "innocent mistakes" which fortuitously created rights or defenses under the prior law contrary to the "justice and equity of the case"; or "reasonable" exercises of the "police power" to prevent injurious future consequences of past conduct.

Retroactive criminal legislation has been virtually unknown in the United States since the adoption of the constitution. In the Supreme Court only two cases under the *ex post facto* clauses have involved political legislation directed definitely toward the oppression of a class of people for their past conduct. Both were concerned with legislation enacted in the passion of the Civil War period and calculated, by means of a prescribed test oath, to deny to sympathizers with the Confederacy access to a large number of occupations. In both cases the legislation was invalidated, but only by a majority of five to four [*Cummings v. Missouri*, 71 U. S. 277 (1866); *ex parte Garland*, 71 U. S. 333 (1866)]. All other cases under these clauses have dealt with attempts by individual defendants to take advantage of the fortuitous fact that their offenses, crimes when committed, occurred prior to some legislation which was concededly reasonable for criminal law administration. Such, for example, are laws changing the number of jurors required on a grand or petit jury or the requirement of unanimity in jury verdicts; or making competent as witnesses persons theretofore held incompetent; or effecting other changes in the method of trial; or modifying the form of punishment. Occasionally defendants have been successful, as in cases where the number of jurors necessary to convict had been reduced; more frequently the attacks have failed. In *Calder v. Bull* the court attempted to be specific: within the constitutional interdict, it stated, is "every law" that "makes an action done before the passing of the law and which was innocent when done, criminal, and punishes such action, . . . aggravates a crime, or makes it greater than it was, when committed, . . . changes the punishment, and inflicts a greater punishment than the law annexed to the crime when committed, . . . alters the legal rules of evidence, and receives less or different testimony than the law required at the time of the commission of the offense, in order to convict the offender." The court is now more circum-

spect. The "constitutional provision," it states, "was intended to secure substantial personal rights against arbitrary and oppressive legislation," and "not to limit the legislative control of remedies and modes of procedure which do not affect matters of substance." Just what changes "of procedure will be held to be of sufficient moment to transgress the constitutional prohibition cannot be embraced within a formula or stated in a general proposition. The distinction is one of degree" [*Beazell v. Ohio*, 269 U. S. 167 (1925)].

The due process clause is held to restrain all governmental agencies, judicial as well as legislative. But the *ex post facto* clause, like the contract clause, does not restrain the judiciary from changes in judicial decision even when resulting in retroactive operation [*Ross v. Oregon*, 227 U. S. 150 (1913)]. The doctrinal reasons are that courts do not "pass" laws, but merely "apply" them to specific cases; that the overruled decision was a mistake as to the law and consequently never was the law; that the overruling decision is not a new law but an application of what is, and theretofore had been, the true law. Doubtless there are better reasons.

The antipathy to retroactive laws is founded on the notions that persons act in bona fide reliance upon the law existing at the time of their conduct and that security as to the consequences of their conduct is distinctly desirable. Even the credulous, however, can hardly believe that all persons always act in reliance upon all the laws that may affect their conduct. The assertion that persons who act in ignorance of the law, or under what is subsequently labeled a mistaken view of it, have their own ignorance to blame for their plight can scarcely be held to meet the challenge of the underlying notions. The truth is that in private litigation courts are constantly making retroactive law, not simply because new and undecided issues are continually arising but because conduct reviewed by courts after it is completed and with full knowledge of its consequences can hardly appear to them in the same light as to the parties involved at the time of the conduct. The process is deemed fair because courts, unlike legislatures, deal with individual cases and can shape their decisions to avoid the hardships of general retroaction. Although some retroactive legislation appears likewise to be fair and necessary in the light of experience and social change, a universal stigma attaches to abstract retroaction in the law. "Circumlocutions" and "forms of words" de-

signed to distinguish the fair from the unfair have been developed in abundance. As a consequence logomachy has sometimes triumphed over wisdom or substance. Courts have differed with legislatures and with each other on the issue of fairness. But generally in times of calm legislatures, like courts, entertain the human feeling that ex post facto laws are "oppressive." And in times of strife or excitement judges, like legislators, are only human, although the constitutional mandate coupled with judicial habit may have a mollifying influence.

RETZIUS, ANDERS ADOLF (1796-1860), Swedish anthropologist. Retzius became interested in anthropology through his father, Anders Johan Retzius (1742-1821), who was professor of natural history at Lund and was regarded by Linnaeus as one of the foremost of his followers. The younger Retzius was professor at the Karolinska Institute in Stockholm from 1824 until his death and founded there an anatomical museum. His system of classifying human types according to head form and facial angle, first put forth in 1842, constitutes his most important methodological contribution to anthropology. He formulated the concepts of dolichocephaly and brachycephaly, prognathism and orthognathism, and believed that these measurements formed the basis for a systematic and scientific classification of all human types, a view long popular but more recently regarded as untenable by anthropologists who require a

wide variety of measurements before deciding upon biological relationships. The facial angle has not proved to be as important in describing human types and subtypes as Retzius considered it, largely because of the difficulties involved in obtaining accurate measurements; but in spite of the fact that it is methodologically unsatisfactory it is frequently employed today. The terminology proposed by Retzius has not only persisted but is approved in contemporary anthropological nomenclature, while his technique of combining head measurements into indices has been extended so that indices of face, nose and ear forms and of body dimensions are now in common use.

REUTER, BARON VON, PAUL JULIUS (1816-99), founder of the British telegraphic news agency which bears his name. Born in Cassel of Jewish parents, he became interested in experiments with the telegraph during his early years. The opening in 1849 of the first telegraphic line on the continent, that from Berlin to Aix-la-Chapelle, gave him an opportunity to set up an organization which, using couriers, railways and carrier pigeons as well as the telegraph, was successful in transmitting news of the financial markets much more rapidly than the regular methods. But he was hampered by governmental censorship, and when the Dover-Calais cable was completed in 1851, he moved his headquarters to London and became a British citizen. At first his service was purely commercial, but even before the Crimean War a little of his information appeared in some newspapers. The developed press agency, however, dates from 1858, when after a difficult task of persuasion he secured a number of the London papers as his customers. From this point "Reuter's" rapidly

became in England "synonymous with foreign news" and within fifteen years was able to charge £1000 for its full annual service. The business was incorporated in 1865 and Reuter retired from active management in 1878.

Reuter's success was in the first instance due to his capitalization of the opportunity offered by the untried telegraphic system, which grew up very rapidly. Newspapers could take advantage of this only through the organization he offered them. His agents and correspondents were everywhere and were trustworthy, his political impartiality was absolute and he contributed a good deal to actual cable laying. He founded and accelerated the development of the world organization of communications, which still persists.

REVENUE FARMING is the practise of assigning public revenue to private individuals or institutions in return for the payment of a lump sum to the public treasury. The difference between the amount paid and that actually collected constitutes the profit of the revenue farmer. The practise may be applied to revenue derived from public property or from taxation. While the farmer of revenue from public property may derive his return from the application of improved methods in the utilization of the specific property, thereby creating the source of his profit, the tax farmer as a rule secures his profit by increasing the collections at the expense of the taxpayer. Fiscal opinion generally regards tax farming as a wasteful form of revenue administration which has no place in a modern system of fiscal organization. A method intermediate between direct collection of taxes by government organs and revenue farming is the device, employed in several countries, of entrusting the collection of revenue, particularly of taxes, to private individuals who act on account of the fise and receive a definite percentage of the receipts as commission.

Tax farming is an ancient practise. It arose whenever the growth of public revenues was not accompanied by the development of a permanent and salaried body of government officials equipped for the complex task of assessing and collecting taxes. This was the case in Greece and in the early period of the Roman Republic,

where government offices were positions of honor assigned by rotation to all free men. As the officials were not trained in financial matters, they inevitably assigned the collection of customs duties and other fiscal levies to wealthy citizens who advanced the funds to the treasury and employed commercially trained slaves to collect the taxes.

In the Greek cities and in the early period of the Roman Republic the results were not unsatisfactory; the amounts involved were not large and the compactness of the state made possible effective public control which prevented the tax farmers from reaping huge profits at the expense of the taxpaying citizenry. But with Rome's territorial expansion the fiscal administration became increasingly complicated. Farming of taxes and of the rents and taxes to be paid by tenants of the *ager publicus* in the provinces involved large funds of capital and serious financial risks. Pledges had to be given to the treasury for the sums due to the state. In order to raise the necessary capital tax farmers united into companies (*societates publicanorum*), which secured profitable contracts to supply the materials for public works and also engaged in usurious lending to provincial municipalities. The increasing size of administrative areas and the growing economic and political power of the tax farmers prevented an impartial control of the provincial magistrates in checking the manifold abuses of the tax farmers.

With the inauguration of the empire certain reforms were initiated: the farming of direct taxes was abolished and an impartial administration by permanent and well trained officials was attempted although never fully realized. The emperors continued to farm indirect taxes, especially customs duties, but provided some measure of supervision to counteract the high profit and other abuses of the tax farmers. After the first century of prosperity, when taxes were relatively low, the position of the taxpayer in the Roman Empire became progressively worse and from the time of Diocletian Roman subjects were no better off than under the *publicani*. Collection of direct taxes in the provinces was more and more entrusted to the municipal authorities. The municipalities, however, were in such bad financial shape that they were unable to guarantee the public revenue as the tax farmers had done during the republican period. In order to protect the treasury against financial losses the Roman government finally adopted a system in which the wealthier citizens were made to

answer for the taxes owed by all inhabitants; the ten or twenty wealthiest members of the local communities were forced to make up any deficit in the amount assessed to their district. This system could have no other effect than to deter people from saving and investing.

Difficulties also multiplied in the administration of indirect taxes. As the government tightened the control over the activities of the farmers of customs duties and other indirect taxes, the profits tended to decline and there was no incentive for private capitalists to bid for tax farming. Consequently the government resorted to compulsory methods; the person designated was obliged to assume the task of tax farming and was personally responsible for the delivery of the assessed amount. Nominally farmers of taxes, these persons became in reality unpaid or badly paid state officials. A general system of despotic compulsion prevailed first in the oriental provinces and from the third century A.D. in the other parts of the empire. The position of the tax receiver, whether or not he was a tax farmer, was universally dreaded. That of the taxpayer was still worse, for non-payment of taxes involved not only confiscation of property but also corporal punishment. The emperor endeavored to check the harsh methods employed in the collection of taxes by appointing *procuratores* to supervise the activities of the tax collectors; but from the third century abuses continued to multiply.

In the later period of the empire the big landlords offered to deliver in a lump sum to the treasury the taxes due from their possessions in return for their right to collect taxes from their tenants. This system was still more pernicious than tax farming, since it favored the spread of feudalism. In the cities the corporations of artisans and of small traders were held responsible for the sums imposed upon them and individuals were not allowed to leave their trade or to relinquish their membership in the corporation. The failure of the Roman Empire to develop an effective and impartial tax administration undoubtedly contributed greatly to the ruin not only of private households but finally also of the public finances.

Another instance in which long retention of the system of tax farming ended in abuse and financial disorder is to be observed in the history of the French kingdom. The early resort of the French kings to revenue farming was probably due to the general absence of a permanent body of government officials in the early Middle Ages.

The practise may have been further suggested by the custom whereby the *prévôtés* collected the rents and taxes from the king's domain. The farming of special forms of revenues, such as fees, was resorted to as early as the thirteenth and the fourteenth century. Whatever the origin of the different forms of revenue farming in France, there is general agreement that the retention of tax farming long after the development of a permanent bureaucracy as an instrument of public administration was due to bribery of prominent members of the court and to the chronic financial difficulties of the treasury, which came to depend largely upon the advances of the wealthy tax farmers. Even such honest and able financial administrators as Sully and Turgot could not abolish tax farming, because the government was never able to repay the advances of the farmers when they became due. As late as 1706 out of 150,277,864 livres of public revenue farmed revenue amounted to not less than 59,520,000 livres.

Similar conditions and abuses existed in mediaeval and postmediaeval Spain and Portugal. For a short time tax farming was tried in the Netherlands, in England, in Germany and in the Italian cities. It was resorted to at Bagdad during the decay of the Arabian empire and continued into the modern period in Turkey. In Russia taxation of alcoholic drinks was farmed out from the time of Peter the Great until 1861. Two features characterized many of these tax farming experiments: foreigners figured prominently among the revenue farmers, and the accumulation of vast fortunes by the tax farmers provided a stimulus to the development of modern capitalism.

While tax farming assures the government a fixed income and thus enables it to plan the budget, the abuses attendant upon the device of farming and the dangers inhering in the existence of a wealthy group of tax farmers, whose interests frequently conflict with those of the tax-paying citizenry and of the state, outweigh the possible benefits of the system. Fiscal doctrine and practise in modern times regard the collection and administration of taxes as a direct function of public authorities. Turkey, for instance, abolished tax farming as soon as modernization of its political and fiscal system permitted. The collection of indirect taxes of municipal bodies by farmers against payment of a lump sum is not generally held as dangerous but is uncommon at the present time. Special forms of collection by private individuals on

government account, against the payment of a commission, are in use in Italy; and a somewhat similar measure (the "tax ferrets" system) whereby percentage rewards are given to private persons instrumental in tracking down tax delinquencies has been used in the state of Ohio in the United States.

In the administration of public revenue other than taxation the tendency is likewise toward direct state management. With the exception of public farm lands, which are generally let to tenants for private utilization in return for fixed rental, other forms of public property, such as utilities, mines, forests and mints, are administered in most countries directly by public authorities. Frequently such enterprises adopt the form of joint stock companies, whose shares are owned by public authorities. In recent years some countries in search of credit have resorted to a form of revenue farming; for example, the revenue from the match monopoly was assigned to the Swedish match concern of Ivar Kreuger in return for a loan secured by the latter. Considerations of state prestige probably account for the retention of the practise of farming revenues from gambling establishments.

REVENUES, PUBLIC. Public revenue comprises the receipts and income by which the agencies and services of government are supported. This revenue is always drawn in some manner from the people, but the particular methods by which it is obtained have varied in

different periods, although at all times they have been fairly closely adapted to the prevailing economic and political structure and to the current objectives of government itself. As the term implies, there should be an element of public purpose in the collection and application of public revenues; the source of the authority which defines the public purpose has, however, differed with the type of government. Under the feudal system the source was the feudal overlord, who traced his authority to a divine right of rulership; in the democratic state the people are the constitutional source of all authority; in the autocratic state might makes right, and expropriation of personal and political opponents becomes a method of providing public revenue.

One of the most significant characteristics of modern political history is the slow but steady emergence of popular government. Accompanying this evolution there has been, on the fiscal side, an increasing emphasis upon the obligation of the people to support their government. This obligation now clearly depends, in the democratic state, upon the right of the people to consent to its imposition. Rulers have always derived their sustenance and the financial support of their regimes from the territories over which they rule and the people therein or from the conquest of other groups. But governmental income and revenues so obtained have acquired a full and complete status as public revenues only in proportion to the acquisition by the people of the right of participation and finally of that of determination of their amount, their character and the purposes for which they are to be spent.

The development of the public aspect of fiscal relations is illustrated clearly in the emergence of taxation as the principal form of public revenue. Although various kinds of taxes were known and used both in ancient and in mediæval times, taxation occupied on the whole a minor position in the ranking of public revenues until well into the modern period of democratic national development. The "readiest means" available to the ancient or the mediæval state were obtained by other methods than taxation. The fiscal policy of such states was shaped in accordance with the current economic situation and the demands of political expediency, and an extreme reliance upon the taxing power was inconsistent with the basic objectives of governmental policy and method. The emphasis which the later cameralist writers and Adam Smith placed upon canons or principles of just taxation

reflects the dangers which inhered in an arbitrary and unrestricted exercise of this power, uninfluenced by those considerations of public welfare and public purpose which are now accepted as fundamental.

A survey of the attempts at formal classification of public revenues reveals the changing emphasis upon different revenue sources. Jean Bodin in 1576 (*Les six livres de la république*, bk. vi, ch. ii) wrote that the following seven ways of raising revenues "include all that may be thought of": the landed domain, conquests, gifts, tributes, public trading, customs, taxes. Of these he regarded the first as the most just and certain, while the last, taxation, was to be used only if all other means were insufficient and an urgent necessity existed. The emphasis upon the landed domain, the property of the prince, was natural in the sixteenth century, for many princes then owned large estates. The revenues from these private sources and those obtained from the subjects in various ways were not segregated. There was no fundamental distinction between public revenues and the private revenues of the sovereign, nor was there clear distinction between the expenditures for public purposes and those for the private, personal purposes of the ruler.

Bodin's list of revenues omits one group which was certainly important in his time and which was stressed by later cameralist writers — the regalian revenues. Von Justi, a German cameralist, writing in 1758 (*Staatswirthschaft*, 2 vols., Leipzig, vol. ii) classified the revenues of the state according to their chief sources as follows: from the crown estates, or the domain, from the regalia, or royal privileges; from taxation; from miscellaneous sources. It is significant that as late as the middle of the eighteenth century taxation was considered by the trusted financial advisers of the German princes as of less importance than the domain and the regalian rights carried over from the feudal regime.

Adam Smith shifted the emphasis which had formerly been given to the sources of revenue and put taxation in the first place. By his time the English crownlands had been alienated in large part by a succession of extravagant monarchs, and the public character of government finance had definitely been established under the English constitution. Parliamentary control over taxation was assured, although this did not yet mean popular control in the fullest sense. Smith's primary classification of public revenues distinguished that obtained from some

fund which belongs peculiarly to the sovereign or commonwealth and that drawn from the revenue of the people. Since public stock, or capital, and public lands, the two important sources of revenue under the first category, were at once improper and insufficient sources for defraying the expenses of any "great and civilized state," Smith concluded that the greater part of these expenses must be met from the revenues of the people by taxes of one kind or another, "the people contributing a part of their own private revenue in order to make up a public revenue to the sovereign or commonwealth" (*Wealth of Nations*, bk. v, ch. in, pt. i). In fact Smith stressed the costliness of the revenue from the crownlands and advised their sale, suggesting the application of the proceeds to the payment of the public debt.

Taxation has continued to be the most important source of public revenue and the public domain has dropped well toward the bottom of the list. During the nineteenth century there was some reaction against Adam Smith's extreme conclusions regarding the public domain, although not until extensive, costly alienation had occurred, both in the United States and in Europe. In particular the existence of valuable natural resources and the possibilities of their conservative exploitation through a controlled leasing system were overlooked in the United States until the richest stores of such wealth in the public domain had been wasted or alienated. At present some states are once more building up their public land domain, but the motive is conservation rather than direct revenue.

Public trading, approved by Bodin, who said that it was better for a prince to be a merchant than a tyrant and better for him to traffic than to steal, but disapproved by Smith, who thought that no two characters seemed more inconsistent than those of trader and sovereign, grew in popular favor during the later nineteenth century, especially in the field of municipal ownership. This extension of the public domain into the industrial field, often characterized as the industrial public domain, was not infrequently inspired and induced by other motives than revenue. Indeed some of the most costly of these ventures, such as the state owned railway systems, have only the remotest prospects of overcoming the deficits which their operation incurs. In many individual instances, however, municipally owned industries have consistently returned a profit which has been available for the reduction of local taxation. Much depends of

course upon the policy of prices and management. The federal post office in the United States could no doubt yield a profit if it were operated on the basis of a strict cost principle rather than on that of supplying an essential service. At the other extreme stand certain industrial monopolies, such as those of salt, tobacco and matches, which have been operated primarily for fiscal advantage, with quality and service as secondary considerations.

The weight of taxation and the extension of governmental services into many activities in which the special benefit to individuals tends to overshadow the general public benefit have led recently to some emphasis upon prices or specific charges, as against general taxation, to provide the necessary funds for construction or operation. Fees have long been used to cover the cost of certain types of special service of an administrative nature. Special assessments have been levied quite commonly for the improvement of streets. Tolls, once generally relied upon to finance roads and bridges, are being restored after a period of disuse. Service charges for the expense of sewer operation are likewise gaining in favor. Tuition charges for higher public education may be instituted in the near future. It is quite unlikely that these developments, in the aggregate, will ever supplant taxation as the major source of public revenue. They constitute an effort to correct the defects and shortcomings which are encountered in even the most carefully worked out system of taxation, and within reasonable limits they are useful and important devices for securing public revenue.

Public borrowing may be viewed, as of the time of issue, as a source of public revenue. Public loan proceeds increase the government's spending power at the time and thus either augment or replace the revenue, otherwise derived from taxation. In the end, assuming that the loan is repaid in something like the same monetary unit as that current at the time of issue, the process becomes simply a device for rearranging the time distribution of the burden of taxation.

The developments in public revenue in modern times have naturally influenced the treatment of revenue classification in fiscal literature. Bastable suggested two main divisions: revenue obtained by the state in its various functions as a great corporation or "juristic person" operating under the ordinary conditions which govern individuals or private companies, and revenue taken from the people. H. C. Adams

proposed a threefold classification: direct, derivative and anticipatory, relating respectively to the revenue from industry and the domain, from taxation and from public loans. E. R. Seligman's major grouping is also threefold: gratuitous, referring to gifts donated to the state; contractual, covering the whole range of payments for services supplied by public property and government owned industries; and compulsory revenue, derived by the state by virtue of its taxing power. The last category also includes income received by the state by virtue of its right of eminent domain and its power to impose fines and penalties. Continental writers generally have sought to distinguish between ordinary and extraordinary revenue, placing in the former category income from the domain and other property, fees and taxes and in the latter such items as the profit from the sale of state property, public loans, the profit from forced or debased currency and so on. The primary distinction between ordinary and extraordinary revenue is obviously difficult to maintain in all cases.

The essential thing about a scheme of revenue classification is that it should be logical, appropriate to the subject matter and reasonably realistic. None of the schemes mentioned above distinguishes adequately between those revenues obtained from the conduct of some economic activity and those received as an incident to the performance of routine administrative acts. Seligman's suggested treatment of gifts, or gratuitous revenue, as coordinate with contractual and compulsory revenue is logical but unreal. In any tabulation of public revenues by governmental units there would be far more blanks than entries under this head.

A workable compromise classification which appears to meet the requirements reasonably well is the following: commercial revenues; administrative revenues; tax revenues; public loan revenues (viewed as of the time of issue); bookkeeping revenue transactions. The extent of governmental agency transactions in modern times calls for bookkeeping revenues, which represent amounts collected or handled for or on behalf of other governmental units. This is especially important as between the states and their inferior jurisdictions, such as counties, municipalities and school districts.

In each country the public revenue system is a product of local developments and conditions, and international comparisons are of small significance. Taxation provides the bulk of central

and local revenue everywhere, although the proportion obtained in this way varies, being smallest in those countries which have important fiscal monopolies. The revenue derived from state lands and other capital investments, aside from fiscal monopolies, is insignificant in all national budgets. In nations under a federal government, such as the United States, there tends to develop, especially during periods of fiscal strain, a certain rivalry between federal and local governments in tapping the more productive tax sources, with the result that the tax load may be concentrated heavily on certain classes of taxable objects. The problem of allocating or sharing revenue sources among different grades of governmental units, all of which must be supported from the same fund of wealth and income, is seldom approached in such cases from the standpoint of equalizing and allocating financial burdens and responsibilities as well as revenues. The result has been an extensive development of aids, subsidies and grants from superior to inferior units, with little or no regard for the capacity of the beneficiary units to perform efficiently the services in aid of which the grants are given.

Viewed from the time aspect, public borrowing acquires special significance as a means of providing public revenue. Emergency public financing, whether occasioned by war, by disaster, by the desire to promote industrial recovery after a depression or by the need of making extraordinary improvements, has usually involved strong reliance upon public loans. As a device for equalizing the financial burden of an emergency in time the loan policy is defensible, although the all taxation policy has not lacked ardent supporters. What is commonly overlooked in the loan policy, however, is that no emergency may safely be regarded as non-recurring. The few cases in which a reliable judgment on this point would be extremely difficult have served as a general excuse for the failure to make drastic provision to repay, before the next recurrence, the loans issued to finance an emergency. Unless vigorous efforts are directed toward this end the augmentation of public revenues by borrowing may lead to an insupportable burden for debt service. Repudiation, direct or indirect, is the usual avenue of escape under such circumstances.

REVILLAGIGEDO, CONDE DE, JUAN VICENTE DE GUIMES PACHICO Y PADILLA (1740-99), Spanish colonial administrator. After a military career Revillagigedo was appointed to the viceroyalty of Mexico in 1789 and until 1794 occupied this office, which had been held by his father from 1746 to 1755.

Revillagigedo was the greatest of the eighteenth century viceroys—honest, energetic, statesmanlike and, for a Spanish administrator of his period, a wise economist. Sympathizing thoroughly with the reforms projected by José de Gálvez he tried to check abuses, improve viceregal administration and promote industry. He assisted in installing the intendant system and was interested in education and the founding of schools. Under his rule finances were reformed and the public revenues reached the highest figure in colonial times. The administration of justice was also improved and the secretariat systematized so that documents became more accessible. He caused a census to be taken, aided the construction of bridges, roads and canals and attempted to prevent the spread of epidemics by enforcing sanitary rules. Measures were taken to improve coast defense, and subsidies were sent to border provinces. Mexico city was particularly benefited by his regime. Revillagigedo left for his successor a document entitled *Instrucción reservada* . . . (Mexico 1831), which shows a remarkable understanding of the machinery of Spanish colonial government.

REVIVALS, RELIGIOUS. In its broadest sense the term religious revival includes all religious practises involving mass enthusiasm or group excitement. Mass excitement, ranging from collective dread or joy to hysteria, is one

of the most primitive and pervasive aspects of religion. Typical forms are found in the corroborac rites of the Australians, the shamanistic performances of the Siberian tribes, the Peyote cult of the Winnebago Indians, extreme forms of *bhakti* in modern Hinduism or of Shinran Buddhism in Japan, the frenzy of the *macnads* in the Dionysiac mysteries and Chassidism among the Jews. To these random examples from various religions might be added a few illustrations from the history of Christianity: the first Pentecost, the crusades, occasional outbursts at the shrines of healing saints and regular demonstrations at seasonal celebrations, such as the exuberance of a Russian Easter or the pilgrimages of Holy Year.

In a second and more restricted sense the designation is applied, particularly by Christian theologians, to periodic awakenings of religion over large areas and in connection with more general social movements. According to certain schools of theology religion naturally obeys a periodic law, stagnation and decline being followed by more or less sudden and unforeseen waves of "spiritual awakening"; but it is evident that social processes and transformations throw more light on these revivals than the mere formulation of a periodic law. Of many such waves in the history of Christianity only a few of the most significant may be singled out. The activities of the mediaeval friars, especially the Franciscans, began a revival and led to such reform movements as those of Wycliffe and Savonarola. In general they were occasioned by the growth of town life and the concomitant decline or corruption of the feudal aspects of ecclesiasticism. Later the growth of nationalism sometimes took the form of religious revivals, as in Bohemia in the fifteenth century, Scotland in the sixteenth and seventeenth centuries, Norway and Denmark in the eighteenth and nineteenth. The social and economic upheavals of the seventeenth and eighteenth centuries were especially fruitful in stimulating revivals, notably in the case of the Quakers and Anabaptists, whose prophetic warnings and extreme observances were protests against growing poverty and oppression, and of the Pietists, who attempted to reform society by cultivating personal piety, engaging in elaborate devotional exercises and promoting missions and other philanthropic enterprises. The Oxford Movement and the recent Catholic "renewal" are spoken of as revivals in this sense.

In a third, and most technical and distinc-

tive, sense the term signifies the phenomena and methods of modern evangelism (*réveil*, *Erweckung*), directed as a rule to the founding of evangelistic churches or societies. The characteristic features of such evangelism are itinerant preaching and camp meetings; extreme emotional appeals and religious demagoguery; public confession, conversion and more or less permanent reform of personal conduct; fixed seasons for revival meetings when whole congregations or communities are organized for a period of intense emotional stimulation and of concerted appeals to the "unregenerate."

The rapid spread of this type of revivalism in the modern period had been forwarded in large part by the fact that religious forms of excitement and enthusiasm in which even the humblest and most abject could participate effectively offered a convenient form of relief for the growing monotony and misery of the proletarian classes. A second factor in the spread of modern revivalism has been the wide prevalence of frontier conditions, the hardships and isolation of which demand simple forms of entertainment, popular worship and imaginative escape to larger issues and wider communities. Another factor has been the exploitation by skilled leaders of adolescents, of the uneducated, of "primitive" peoples or of other groups readily subject to emotional disturbances. At times all of these factors may be operative, as in the case of certain Negro communities in the United States whose contacts with modern civilization subject them to extreme social tensions. Revivalism still has its strongest hold among the Negro congregations of the evangelical churches, whereas otherwise it fell into disuse when the social conditions conducive to it ceased to prevail. Especially prevalent are the hypnotic rhythms and cadences of the Negro spirituals, the enthusiasm of the "experience meetings," violent "mourning" over sin, "falling out" under the conviction of sin and hysterical dancing, shouting and rejoicing. Other instances of the flourishing of revivalistic religion as a result of Christian impact on primitive cultures are: the new religion which spread among the Indians of northern New York early in the nineteenth century as a result of the revelations of the Great Spirit to Handsome Lake, a Seneca medicine man; the naked "shakers" among the Puget Sound Indians; the Peyote cult among the Winnebagos, which combined the effects of eating the narcotic cactus (peyote) with the exaltation and ecstasy of Christian mysticism; and

the Ghost Dance religion, which spread about 1890 among the Plains Indians as a result of the prophecies and visions of Wovoka and Sitting Bull. The mission field in general affords numerous illustrations of similar phenomena. Revivalistic methods were commonly applied by the early evangelical missionaries, but as a rule such tactics have been largely displaced by educational methods. The most recent revivalistic movement in the Orient was the Shanghai Revival of 1925, promoted by the World Wide Revival Prayer Movement. In general the decline of revivals may be explained not so much by the disappearance of conditions promoting them as by the appearance of secular forms of diversion and secular movements of revolt and collective action.

In the history of American revivals three types may be distinguished. Local outbursts may be caused by unconventional preaching or by social crises or by both, as, for example, the revivals of 1734-40 centering about the preaching of Jonathan Edwards and the popular belief that the Spirit of Grace was being poured out and was working regeneration by supernatural and drastic means in the face of ecclesiastical decline. The financial panics of 1837 and 1857 were accompanied by similar revivals in many of the larger cities. The southern armies during the Civil War underwent numerous revivals, although as a general rule war time is not favorable to revivalism.

A second type centers about the activities of itinerant evangelists. The first movement of this kind was the Great Awakening, beginning in 1740 with the preaching of George Whitefield in New England and spreading over the whole Atlantic seaboard in the following decades. In addition to Whitefield and the Methodist pioneer itinerants, the outstanding preachers of this movement were Gilbert Tennent and James Davenport, whose highly emotional appeals marked a new epoch in homiletic oratory. After the American Revolution there was a revival of religion in the colleges, students being swayed from the prevailing rationalism by the preaching of Timothy Dwight, Lyman Beecher and other educational leaders. In 1800, under the influence chiefly of James McGready, the Kentucky revival began, centering in Logan county, which was notoriously peopled by reprobates, and spreading over a large area, chiefly among the Scotch-Irish settlers. It was characterized by many so-called physical symptoms of supernatural grace, the "jerks," "singing ecstasies" and

the like. Other revivals were led by Lorenzo Dow, a Methodist itinerant, by Asahel Nettleton among the northern Congregationalists and by Charles G. Finney in central New York. The last named evangelist is of especial significance because he used less emotional appeals and was successful in converting mature men. A lawyer with almost hypnotic power, he appealed by argument to legal minds and his famous Rochester revival of 1842 was noteworthy for its lasting effects on the adult population. The greatest of all the evangelists, however, was Dwight L. Moody, whose campaigns in the United States, Great Britain and Ireland between 1857 and 1899 not only influenced millions but also raised revivalistic methods to a somewhat higher plane. Perhaps equal in power to his oratory were the hymns and singing of his partner, Ira D. Sankey. Moody and Sankey contributed to revivalism a pervasive literature, a technique for conducting highly organized campaigns and several enduring educational institutions. Of the succession of evangelists since their day who have conducted similarly organized campaigns B. Fay Mills, Sam Jones, R. A. Torrey, J. Wilbur Chapman, William A. Sunday and Gipsy Smith are worthy of mention.

The third type of revivalism is promoted not merely by itinerant individuals but by organized churches, sects or other religious bodies. About the middle of the nineteenth century the evangelical churches began to lay less stress on revivalistic methods. Minorities, however, especially among the Methodists and Baptists, organized to maintain the emphasis on "perfect love" or "holiness" and to continue itinerant evangelism and revivalistic camp meetings. From such groups several distinct churches arose, as the Church of the Nazarene, the Churches of God, the "full gospel" churches and certain branches of the fundamentalist movement. For the most part, however, revivals were promoted within the older denominations by interested minorities. Among the Methodists and Baptists revivalistic efforts were confined to certain seasons, usually midwinter. Since the days when Horace Bushnell's *Christian Nurture* launched the first effective attack against the conceptions of sudden regeneration and conversion, revivalistic methods have declined steadily in these churches as well as in other organizations, such as the Salvation Army and the Young Men's Christian Association, which originally devoted a large share of their energies to revivals.

In England revivalism began with the Wesleys in 1743. While John Wesley was in some respects a social reformer, his chief social significance lies in the fact that he gave the English urban proletariat a democratic religion and an effective emotional outlet. The religious experience of mass emotion and collective action by working men contributed indirectly to the labor movement, although in its inception it had no economic program or application. Moody's Ulster revival of 1859, his Edinburgh revival of 1873 and his various English revivals, on the other hand, had little if any effect on the labor movement and found their chief stronghold in the middle classes. The Welsh revival of 1904-06 had an effect on the miners of Wales similar to that of the Wesleyan revivals on English workers, with two additional features: it stimulated a religious nationalism and it generated an interest in occult phenomena. The Scottish revival of 1843, led by Thomas Chalmers, marked the founding of the Free Church of Scotland. In Geneva, R. Haldane had begun evangelistic efforts as early as 1816 and after the revival there in 1828 the Société Évangélique was founded in 1831 and the Église Évangélique Libre de Genève in 1849. In France similar movements led in 1833 to the founding of the Société Évangélique de France, which in 1910 became the Société Centrale Évangélique.

The nineteenth century revivals in Germany had some historical connection with eighteenth century Pietism through the continued activities of Spener's *Stillen im Lande*, of the Moravians and of the Methodists, but they were caused primarily by the romantic reaction against the Enlightenment and the belief in Germany's providential deliverance from Napoleon. Of this general revolution in religious sentiment Schleiermacher was the theological spokesman. In addition, however, the movement in some of its aspects had economic causes and consequences. Socially speaking, there were three contrasting revivals. In the northwest during the years 1814 to 1836, coincident with the industrial revolution, there appeared the religious phenomena typical of the Wesleyan revivals in England. The most influential leaders were Krummacher, pastor at Elberfeld; Weisgerber, a converted shoemaker; Terstegen, an itinerant evangelist; and J. H. Volkening, whose hymnal, *Kleine Missionsharfe*, set the mode for revivalistic singing in Germany. This revival was characterized by a general interest among the laboring classes in otherworldly salvation and rejoicing in divine

love, while among the upper bourgeoisie there was a general turning from worldliness to philanthropy. Laymen and laywomen took a prominent part. Politically the revival encouraged liberalism. Ecclesiastically it led to the founding of German Baptist churches (Hamburg, 1834) and German Methodist "missions" (Bremen, 1849). Many who participated in the revival remained Lutherans, notably Spitta and Petri of Hanover.

The contemporary southern revival was definitely Old Lutheran, antifederationist and on the whole confined to the intellectual classes. Among its leaders was the philosopher Schelling, and its chief organ was the noteworthy *Zeitschrift für Protestantismus und Kirche*.

The revival in the northeast was politically and socially conservative. It began in Berlin in 1810 with the founding of the Christlich-deutsche Tischgesellschaft among the aristocracy, which culminated in the fashionable Pietism of Frederick William IV and of Bismarck. Klopstock, Gerlach and others were encouraged to cultivate a Pietistic learning, while the nobility organized missions, Bible societies and other religious philanthropies among the peasants. The middle classes, apart from writers and pastors, were scarcely touched by the revival. The government appointed only "awakened" pastors, thus forming a strong evangelical wing in the Lutheran church, which eventually came into conflict with the Old Lutherans of the south.

Among Catholics the activities most closely approximating evangelical revivalism are those of the missions, which are in the hands of various orders. Chief of these are the Society of St. Vincent de Paul, which in addition to its philanthropies has promoted the practise of general confession, the Brethren of the Common Life, the Capuchins, the Lazarists, the Redemptorists, the Passionists and the Paulists. These have all been active in reviving religious interest among the lower classes, while the Jesuits as a rule have worked among the wealthy. But the work of these orders is seldom similar to the methods of evangelical revivalism.

REVOLUTION AND COUNTER-REVOLUTION. The term revolution, outside the natural sciences, connotes a sudden and far reaching change, a major break in the continuity of development. Its application is often specifically indicated by a qualifying adjective, as in the expression cultural revolution or industrial revolution. In nineteenth century political science the term when used alone was meant to refer to political revolution. It is for this reason that the ideas of revolution and violence appeared to be so closely connected. For no political system is so flexible as to be susceptible of fundamental change by "legal" means; and illegality implies resort to force by the revolutionist as well as by the state which he attacks. To a modern student of social science the identification of revolution with political upheaval and the consequent emphasis on violence as its salient characteristic appear misplaced. The government does not function *in vacuo*; its personnel, organization and policies reflect the correlation of forces in the society which it rules. It is unnecessary to argue a perfect correspondence between state and society to maintain that a major change in the political order—not merely a shift in the personnel of the government or a reorientation of its concrete policies—must be preceded or accompanied by a drastic change in the relations among the different groups and classes in society. Thus a recasting of the social order is, at

least in modern times, a far more important characteristic of revolutions than a change of the political constitution or the use of violence in the attainment of this end. This aspect of revolution distinguishes it also from coup d'état, rebellion and insurrection, with which it is sometimes confused. In the present discussion therefore the social aspects of the revolutionary process will receive particular emphasis.

The quality of the change characterized as revolution cannot be grasped without consideration of the type of society in which it occurs. This may be described in highly simplified terms as a society torn by an internal antagonism between a small upper class which by virtue of its proprietary claims to certain sources of income receives a considerable portion of the social product and a large lower class which performs all the manual, routine labor and subsists in relative poverty. The conditions of existence of the two classes present a sharp contrast and their interests are directly opposed; for, *ceteris paribus*, the greater the share of the propertied class in the national dividend, the smaller is that of the laboring class. It need not be assumed that the upper class is entirely sterile or parasitic. The full fledged citizen of the Greek city-state cultivated the arts and sciences; the *cives romani* built and ruled a world empire; British landed aristocracy in the course of centuries developed an amazing skill in statesmanship; Prussian junkers supplied the Hohenzollern monarchy with many efficient army officers and civil administrators. In capitalist societies the upper class is even engaged in economic tasks—not in subordinate manual duties, to be sure, but in organization and management. Yet the income of the capitalist entrepreneur, like that of the slaveholder of antiquity or of the feudal lord of the Middle Ages, is based exclusively on the right of ownership. This becomes abundantly clear with the spread of the corporate form of business organization; despite the fact that the functions of production and business management pass to salaried employees, the income claims of capitalists and entrepreneurs remain unimpaired. In addition to the mutually antagonistic upper and lower class such societies comprise a number of intermediate strata. While the relative weight of these middle groups, their traditions, political orientation and cultural make up have a definite bearing upon the origin and development of revolutionary processes, the dynamic factor of revolution is always the tension generated by the conflict of interests of the

upper and lower class. This holds true even in those situations where by various devices of political propaganda an attack from below against the social position of the upper class is made to appear as an offensive imperiling the status of the intermediate groups.

The significance of a revolution lies in the fact that it is not merely a violent and profound modification of the social organization but a major shift in the relations between social classes whereby the dominance of the upper class is destroyed and the lower class emancipates itself from economic exploitation buttressed by political subordination. In the process the old social order is discarded and a new one erected in its place. Bourgeois revolutions, as illustrated par excellence in the French Revolution, signify the social emancipation of the bourgeoisie and the recasting of the feudal corporative regime into a capitalist bourgeois social system. In a socialist revolution the proletariat rises to the position of a ruling class and destroys capitalism by socializing the means of production.

The political and psychological aspects of a revolution are emphasized when it is regarded as an uprising of the many against the few, the subjects against the rulers. For some time before the outbreak of a revolution the upper class finds itself in the position of a minority isolated from the rest of society; and the old order is finally overthrown by the aroused majority because it appears to serve only the interests of the few at the top. A revolutionary outbreak is likewise preceded by a decline in the power and prestige of the political authority; simultaneously there develops among broad masses of people a consciousness of separation from and opposition to the state. Weighted by its own weakness and the growing resistance of the populace, the machine of the state gives way at various points, until a concerted attack by revolutionary forces results in its complete breakdown. Then, as the political system is changed, power passes from the last legitimate to the first revolutionary government; thus the gulf between the rulers and the ruled is, at least for the moment, bridged. In the typical bourgeois democratic revolution this reunion of the people with the state is formalized through the convocation of a constituent assembly which embodies the principle of popular sovereignty.

A counter-revolution is an attempt to reverse the transformations effected in a revolution; its success signalizes the triumph of the upper class, which has been endangered and temporarily

displaced by the revolution. Yet a counter-revolution seldom resuscitates the regime overthrown by a revolutionary onslaught; and the more intelligent advocates of counter-revolution never propose a faithful restoration of the old order. This would scarcely be conceivable in theory or desirable in practise. Revolutions are not undertaken lightheartedly to please the fancies of idealistic youth or to sate the fury of revolutionary agitators; a great revolution occurs only when the disintegration of the dominant social system has reached an advanced stage and its stultifying effect upon progressive forces has become intolerable. A revolutionary trend therefore cannot be neutralized by a return to the very conditions which produced it. A counter-revolutionary movement will look back with longing upon the old system, but the conception of the past from which it derives its goal for the future is a refined and idealized version of the historical reality. Moreover, since it must operate in a revolutionary environment, it is virtually compelled to accept many current ideas and methods; it must learn at least to couch its proposals in the popular phraseology of revolution. In word and in deed counter-revolution is thus an ambiguous mixture of the old and the new. It dare not preach a pure and simple return to the past lest it jeopardize its success with the masses affected by the revolutionary ferment; and it cannot adopt a clear cut revolutionary program if it is to remain true to its historic mission.

A revolution occurs, as Lenin observed, when the upper class cannot and the lower class will not continue the old system. The period leading up to a revolution is marked by increasing inability at the top to maintain the status quo and by growing unwillingness at the bottom to tolerate it. The bourgeois revolutions in western society, for instance, were preceded by an epoch of economic and social change extending over several centuries during which the power of the capitalist bourgeoisie grew at the expense of the feudal nobility. The stage for revolution was set when capitalist enterprise had spread from trade to all the important branches of production and when the feudal nobility had been transformed into a class of absentee landowners living on tribute exacted from the peasantry and on bounty from the state treasury. Similarly a proletarian revolution comes at the close of a fairly prolonged development which culminates in the creation of a proletarian mass conscious of its own power and in the concentration of produc-

tion in a few large plants controlled by private monopolies or by the state.

The maturing of new and potentially revolutionary forces within the old social framework is at first so slow and gradual as to be imperceptible. So long as the new appears to be closely bound up with the old and permeated with the characteristic elements of the traditional ideology, the dynamic character of this development, the fact that it must ultimately transcend the bounds of the existing society, is scarcely intelligible either to the potential advocates of change or to the future partisans of conservatism. In eighteenth century France, for instance, the rise from *ouvrier* to *maître ouvrier* and thence to entrepreneur was still so common that it would have been difficult indeed to perceive in worker and entrepreneur the two antithetical poles of fully developed capitalism, and to foresee that the conflict between capital and labor was to be of much greater historical significance than the opposition between the privileged and the third estates, which was the avowed motivation of the French Revolution.

When the new forces have developed to a certain point, their essential difference from the old must be recognized if they are to continue to grow. A bourgeoisie which is unconscious of its specific characteristics, which does not rise to the conception that the third estate is nothing and should be everything (according to the bold formulation of Abbé Sieyès), which is content to permit the feudal nobility to assimilate its wealthiest and most distinguished members, cannot attempt the reconstruction of state and society. If it is to undertake such a venture it must become aware of itself as an element alien to the established system and develop the courage to fashion the world after its own image. In more general terms, an effective revolutionary ideology must reveal to the rising social class that it is and why it is a class distinct from the society into which it was born; it must offer a critique of the existing order and draw the general outlines of the ideal substitute. The present and the future must be contrasted if only that the claims of the present to absolute validity may be denied.

Even if conceived in the study of a solitary thinker, a revolutionary ideology cannot for long remain isolated from practical life. It must seek to materialize itself; that is, to arouse the masses to the pitch of enthusiasm requisite to the triumph of a major social interest. The transformations thus effected through the ideology and

in it are evident when it becomes the basis of an organized movement. It would nevertheless be a mistake to assume that ideology is more important than organization or that the former precedes the latter; social ideation and social volition do not work independently of each other, nor does organization represent merely a more or less accidental juncture of the two. A thinker in isolation does not evolve a really revolutionary ideology unless his ideas move toward the type of solution being worked out in the world of action. Ideology does not create organization; it merely reinforces and broadens the process of organization by clarifying its causes and aims.

Not all revolutionary organizations are set up ad hoc. In many instances organizations integrated with the existing regime become revolutionized and help to destroy it. The village, the factory, the tenement, the proletarian quarter, develop into active units in a revolutionary struggle. Even the armed forces of the state are subject to transformation. A revolutionized army strikes, or in military terminology mutinies, signaling thereby its dissolution as a fighting body. The revolutionary service which it renders is not the active one of supplying the revolution with a military instrument, but the purely passive one of leaving the tottering regime defenseless. Refusal to obey the old command, abandonment of discipline, is all that may be expected of a fatally diseased military organism. For the armed force of the state a revolution never means simply a change of battle standard; no revolutionary regime inherits from its predecessor an army whose fighting strength is not thoroughly undermined.

Revolutionized organizations operate alongside those which have been revolutionary from their inception. Even among the latter, however, there are some which have been neither formed nor maintained for political purposes; these have nevertheless a definite political orientation which colors and invigorates their activities. An outstanding example of this type of revolutionary organization was the salon of eighteenth century Paris, in which liberalized aristocrats and atheistic clergymen foregathered with bourgeois intellectuals. The salons had been social meeting places for the aristocracy long before the power of the *ancien régime* was at all shaken. But with the approach of the revolution they underwent a complete transformation: they grew in number, they were no longer exclusively aristocratic and they adopted an equivocal attitude, de-

nouncing the government in theory and supporting it in practise. It is initially the revolutionists who set up political organizations; only later do those whom the revolutionists attack establish rival institutions. Under peaceful conditions the ruling class is organized as the state and needs no other specifically political associations; the lower class, on the other hand, must strive to consolidate itself on both the economic and the political front.

The role of organization is likely to be more important in a proletarian than in a bourgeois revolution. The transition from capitalism to a classless socialist society involves more radical and far reaching changes than supersession of the feudal order by the bourgeois system, both of which are marked by an internal antagonism between an upper and a lower class. The social status of the banker, the manufacturer and the highly paid professional prior to a bourgeois revolution is much superior to that which any element of the proletariat can hope to achieve under capitalism; for many bourgeois groups their revolution simply confirms an accomplished change. The proletariat, on the other hand, must organize in order to overcome its sense of subjection and to prepare for the seizure of political power, which represents merely the first decisive step toward its social emancipation. Nor is the socialist movement as limited in dealing with the problems of organization as is bourgeois liberalism. Groups professing a belief in the beneficence of free competition in all spheres of social life will be somewhat averse to rigidity and centralized control in politics, while those whose aim is a planned society will naturally favor the highest degree of organization.

The importance of organization in the achievement of socialism may be illustrated by a comparison of the Russian Revolution of October, 1917, with the German Revolution of 1918. In Russia the Bolshevik party at the head of the masses of peasants, workers and soldiers overthrew capitalism, which, it should be noted, was still rather weak. In Germany the predominance of a nominally socialist but in fact petty bourgeois reformist party helped to save capitalism. The German experience has shown that, just as some organizations of non-revolutionary origin become revolutionized under certain circumstances, associations founded for essentially revolutionary purposes may develop an antipathy to revolutionary action and indeed, without formally disavowing their revolutionary past, may turn into counter-revolutionary bodies.

With regard to legality of revolutionary organization there are certain theoretical differences between the situation confronting revolutionary liberalism and that which socialism must face. Whereas the former attacks a state which does not in principle tolerate any association with political aims, the latter arises under conditions of more or less developed political democracy. In practise, however, the distinction is not as sharp as these formal considerations suggest. For it is unwise to assume that a bourgeois state will permit revolutionary socialist parties to develop to the point where they can command the allegiance of an electoral majority and can grasp political power by parliamentary means; on the other hand, it is a matter of historical record that for some time before its final collapse absolute monarchy was too weak seriously to combat revolutionary agitation and propaganda. Despite its essential "illegality" the revolutionary party or bloc may, in a situation where the disintegration of the old political system is far advanced, arrogate to itself a great many governmental and administrative functions thus competing with the lawfully constituted authorities (parliament with the crown, soviet with the democratic legislature).

Revolutions are often preceded by public calamities, such as famines and wars, which short-sighted observers incorrectly regard as causative. Their true significance from the standpoint of the revolutionary process lies in the fact that they serve to spread and to intensify the inclination to revolutionary action. Such events weaken the loyalty of the intermediate strata to the existing order and assure their neutrality if not their active cooperation in the first stages of a revolution.

The approach of a revolutionary storm is heralded by growing restiveness of the masses and increasingly frequent outbursts of violence on a local scale: assassination of prominent leaders of the government or of government parties; bombing of important buildings in the city and firing of landlord mansions in the country; burning of court records and mortgage deeds; strikes of producers of essential foodstuffs, mass demonstrations and workers' strikes. The immediate effect of each of these occurrences taken separately may be virtually nil, but in the aggregate they indicate that the revolutionized strata are no longer content to remain passive. Any incident, however petty, is apt to set off the actual revolution; the Revolution of 1848 in Bavaria seems to have begun with the dropping of a

student's cane from the balcony into the orchestra pit of a Munich theater.

When a great revolution finally breaks, it encounters virtually no internal opposition; it appears to unite the people rather than to separate them into hostile camps. Psychological drives, such as suggestion and imitation or fear, play a part in this process, although it cannot be entirely reduced to these simple terms. Nothing is more contagious than success in politics as in every other field of human endeavor. The fact that a revolutionary attempt has succeeded, that under pressure from below the governing machinery of the state has collapsed, seems to put the adherents of the old order in the wrong. Few of them have so clear a conviction and so fervid a faith in the correctness of their pre-revolutionary ideals as to persist in their old beliefs under such circumstances. Most of the former conservatives adopt to a varying extent the philosophy of the victorious revolution. The swing in political opinion is so abrupt and so wide that it results in a glaring inconsistency between present professions and past performances. Many converts seem entirely to forget their past; some may see it in a new light as a state of delusion caused by ignorance and abetted by the misleading propaganda of the old regime.

Fear is just as universal a drive as suggestion and imitation. If a revolution fails, few will admit having instigated it, but if it succeeds almost everyone will claim that he worked for and participated in it. In a revolutionary situation fear is a particularly important factor, because revolutions are always movements of the lower class against the upper class. It would be silly to maintain that the under dog is by nature more courageous than the top dog, but it is not unreasonable to assume that such differences develop because of the conditions under which the two classes live. The atmosphere of upper class existence tends to favor delicacy and sensitivity and to discourage self-assertiveness, while survival in a lower class environment is conditioned upon physical endurance and spiritual fortitude. Furthermore the upper class is not habituated to protecting itself by its own efforts, for in normal times this duty devolves upon the police and the courts. But when the old guardians of law and order are replaced by the agencies of the revolutionary mass, the upper class is left exposed and must seek to protect itself. Indeed it stands to lose a great deal unless it can find some way of safeguarding its interests,

a fact which in itself explains the amazing professions of revolutionary sympathy on the part of those whom the revolutionist would instinctively regard as his natural enemies.

Yet in the last analysis psychological factors are merely the superficial manifestations of more fundamental forces. While the upper class individual plays dead, the class as such does not disappear. If at a later stage it is to become the core of the counter-revolutionary movement, it must go along with the revolution in its early phases. In so doing it will attempt to restrict the scope of the revolutionary transformation and to forestall the ascendancy of revolutionary extremism, a task quite consistent with its future role, since the counter-revolution, however reactionary, will accept some of the changes introduced by the revolution.

Upper class participation in revolution is facilitated by the fact that the revolutionists themselves are divided into moderates and radicals. When a revolutionary outbreak occurs, the ruling group grants many demands for which a long and vigorous but futile struggle has previously been waged. The psychological value of these victories is not as great as that of far less important concessions won by peaceful methods, for the occurrence of a revolution and the apparently weak resistance with which it meets raise the hopes and expectations of the revolutionary stratum. But the practical influence of such achievements can scarcely be overestimated, since they lead to a division in the revolutionary camp, previously united in the fight against the common enemy. For the revolutionary mass is never a homogeneous whole; it consists of a large number of groups and subgroups, some of which even before the revolution were not far removed from the level of complete social emancipation while others have still a long way to go. In general the closer a social group is to its goal, the less likely it is to undertake revolutionary action and the more eagerly it will exploit a revolution for its exclusive benefit. After the first concessions have been gained, the groups which have thereby achieved emancipation—the bourgeoisie proper in a bourgeois revolution, the labor bureaucracy and the proletarian élite in a proletarian revolution—tend to withdraw from the revolutionary struggle and to constitute themselves a new party of law and order.

The split between those who have had enough of revolution and those who would continue it leads necessarily to a programmatic and prac-

tical rapprochement between the moderate revolutionists and the prerevolutionary conservatives. The groups whose interests are represented by the moderates are now forced to shift their position; they discard their general anti-government attitude and develop a sympathetic understanding of the benefits of peace, order and authority. Moreover in their efforts to build up a strong governmental apparatus which will defend the new regime against reaction from the right and radicalism from the left, the moderates are compelled to seek the aid of officers of the old army and of the officials of the old government, thus reviving the sense of importance and power of the latter elements. The converted revolutionists and the moderates form the bloc which supports the first revolutionary government.

It is of decisive importance for the further development of the revolution that the new alliance does not endure for long, because its right and left wings gain in strength at the expense of the center. This phenomenon is entirely consistent with the typical conditions of a revolutionary situation. So long as the new government has not consolidated its power and does not enjoy the prestige of legality, the relations among the conflicting social forces remain fluid. Both reaction and radicalism have a better chance to gain their ends before the compromise between the middle groups is finally settled and normal conditions are resumed; they will therefore attempt to prevent stabilization and will push vigorously ahead while it is not too late. The growth of extremism is traceable also to economic factors. Although revolutions are not deliberately planned to provide an immediate cure for economic ills, economic disturbances serve to release revolutionary energies. It is important therefore that in its early stages a revolution aggravates rather than mitigates economic difficulties. Revolutionary strikes of workers and food producers, disruption of communication and transportation, destruction wrought by armed conflicts between loyalists and revolutionists, the sudden and complete impoverishment of many formerly prosperous families, disorganization of state finances, growing insecurity of property— all these make a bad economic situation worse; the material losses thus inflicted constitute the more or less fixed economic cost of a revolution.

In a situation so beset with difficulties there is little likelihood that the moderates who have risen to power on the crest of the first revolu-

tionary wave will long retain control. Their right wing is too close to reaction and their left wing too much inclined to radicalism to permit a rigorous exercise of authority against either extreme. Their revolutionary past will prevent them from attempting to restore the old order, and they cannot establish the new one on firm foundations because their fear of the left compels costly commitments to the right. The weakening of the middle groups, the strengthening of reaction and radicalism and the intensification of social conflicts into a bitter struggle between the right and the left justify the belief that a great revolution culminates not in a free, libertarian regime but in either a "white" or a "red" dictatorship. Although similar in externals, these dictatorships move toward fundamentally different and mutually opposed social systems.

The growth of the right wing of the moderate party signifies ipso facto an increase in the strength of reactionary groups not included in the government bloc and paves the way for counter-revolution. In a bourgeois revolution, counter-revolution is the concern of royalty, nobility, clergy and aristocratic officers and officials, while in a proletarian-socialist revolutionary attempt it is the function of the capitalist bourgeoisie and its following. The fundamental practical problem which counter-revolution must seek to solve arises from the fact that the groups which stand to benefit by it are too weak numerically to carry it through by their own unaided efforts, especially since the revolution has deprived them of much of the prestige and social influence which they enjoyed under the old regime. But, as history has shown, those who are outspoken in demanding restoration—aristocratic émigrés during and after the French Revolution, the Russian anti-Soviet White guard organizations, the monarchist unions and officers' leagues in Germany after 1918—do not succeed in enlisting popular support. To fulfil its historic mission reaction must become plebeian; it must devise a program appealing to those elements which in their social background and outlook are but remotely related to the central group of original counter-revolutionists. These volunteers in a cause essentially alien to their interests must be kept ignorant of the fact that they are organized and directed by reaction; otherwise they will not join or will refuse to act after they have been recruited.

Difficult though it is, the practical problem confronting counter-revolution is not insoluble

In the period of preparation for a decisive struggle between reaction and radicalism—under the government of the moderates—the former ruling class is still in possession of considerable economic and political resources; the influence of wealth, authority, tradition, reputation and personal connections does not evaporate overnight in a revolutionary uprising. By such means reaction succeeds in winning the support of those elements which never had a strong attachment to the revolution and did not expect much from it; while they may have been affected by the enthusiasm evoked by its early victories because these were immediately beneficial to their interests, they are vigorously opposed to any attempts to carry the revolution further. On the other side reaction makes an appeal to the disillusioned revolutionists, those to whom the revolution seemed to promise a great deal, who fought its heaviest battles and who have thus far gained very little or nothing at all. A typical example of the first group is the mass of the middle and petty bourgeoisie in the German Revolution of 1918. These elements supported or tolerated the revolution so long and in so far as they saw in it a movement to end a war which had degenerated into senseless butchery. But in the face of attempts to shunt the revolution from the democratic reformist rut on to a socialist-proletarian track they immediately flocked to the counter-revolutionary standard which proclaimed the defense of property rights. Reactionary appeal to the other extreme was illustrated in the nineteenth century by the overtures of feudal elements toward the proletariat; the latter was to be won over by the promise of social and political reforms to the side of the royalty, nobility and clergy in opposition to bourgeois liberalism. The position of bourgeois counter-revolutionists is more difficult, because there are no classes lower than the proletariat to whom they can appeal. The experience of National Socialism in Germany has shown, however, that counter-revolution in a radical socialist disguise can attract the support of the unemployed, the youth and the unskilled more readily than that of skilled labor organized in free trade unions and educated in the traditions of Social Democracy.

There are two distinct stages in the development of a counter-revolution. In the first the groups with which counter-revolutionary tendencies originate recognize the necessity of accepting the achievements of the revolution in order that it may be stopped before it under-

mines the old structure at the really decisive points. It is probable that even at this time there exists a small group of convinced admirers of the old order; but in so far as they frankly advocate restoration they do not count politically. The outstanding leaders of the class endangered by the revolution understand clearly that at this juncture intransigence means political suicide. In the second stage the division between moderate and extreme revolutionists leads to armed encounters; the economic situation does not improve but grows worse; the popular prestige of the revolution is impaired; and broad masses of people begin to experience an essentially passive yearning for a return to the old. Only then does counter-revolution, strengthened in numbers and drawing its support from a broader social base, begin to give articulate expression to its true program. No longer promising to respect the gains made in the first period of the revolution, it sets as its goal the reestablishment of a refined and idealized version of the old order, a sort of *Zukunftsstaat* in reverse.

Development of a counter-revolutionary movement implies the weakening of the revolutionary class and its ultimate defeat. Historically, however, no reaction has ever expunged all traces of the revolution. The destruction of the existing order by the revolution, the defeat of the revolutionary groups by the counter-revolution, the apparent freedom with which the reactionary leadership proceeds against various classes after it attains to power, the fact that the counter-revolutionary regime can be identified neither with the prerevolutionary system nor with that envisioned by the revolution, all these developments lend plausibility to the notion that counter-revolution instead of merely restoring the old in a new disguise actually creates a new order in which the *ancien régime* and the revolution are negated and transcended in a dialectic synthesis.

It is far more difficult to construe types of counter-revolution than to classify revolutions. A revolution, whatever the obstacles it encounters and the sacrifices it demands, can settle the difficulties which provoked it; in this respect a counter-revolution necessarily and inevitably fails. The reactionary waves released by bourgeois revolutions have retarded but not stopped the victorious march of the bourgeoisie, of capitalism and of parliamentary democracy. Ultimately the antibourgeois forces of the past could reassert themselves only by entering the service

of the bourgeoisie in the support of imperialist expansion and the suppression of the revolutionary labor movement—the policies of finance and monopoly capitalism. A counter-revolution whose practise comes closest to its theory, which, in other words, most nearly achieves restoration, is always in danger of succumbing to a new revolutionary onslaught. On the other hand, a counter-revolution which deviates farthest from the prerevolutionary order, which makes large concessions to the defeated class, in effect re-establishes the old system on a more stable basis; such a counter-revolution marks the opening of a new era whose outcome is altogether unpredictable.

The situation which results when the revolution passes its first stage and runs into political and economic difficulties may be represented as a race between reaction and radicalism. The natural reservoir of radical revolutionary strength is to be found in those strata which are farthest removed from social emancipation, which participate most actively in the revolutionary struggle and gain least by its early achievements. An objective consideration of the various forces at work would seem to indicate that at this point reaction stands a better chance of victory. "The revolution is finished," chant the conservatives in revolutionary disguise in unison with the new advocates of order, the former revolutionists whose ardor has cooled. These groups are united in the desire to prevent the complete materialization of revolutionary potentialities; and in impetuously pushing forward radicalism is laboring under a tactical disadvantage, for it is made to appear subversive of peace and normalcy. A more important handicap is the composition of the radical camp. While the central body of reactionaries includes the stratum habituated to the idea and practise of state power, the radical forces are rooted in the lower class, people who have never had an opportunity to wield any sort of authority. The radical program, which calls for a complete reversal of the traditional relations between the upper and the lower class, now encounters the resistance not only of the propertied classes but also of large groups of professional people and petty bourgeois who believe themselves better fitted to rule than the lower strata on whose behalf the radicals aspire to power. Even to those at the bottom of the social scale the idea that they are to occupy the seat of power appears strange. Their natural response is that of slaves suddenly

set free: they tend either to remain loyal to their old masters or to waste their newly found strength in riot and debauch.

To overcome these difficulties a strong and militant radical organization is of course essential. In addition radicalism must strive to neutralize certain groups and to secure the active cooperation of others, especially from the ranks of the moderate revolutionists. This latter objective is not impossible to attain, since most of the radicals come from a social milieu close to if not identical with that of the adherents of the moderate party, and since the concrete program of radicalism represents the most straightforward and logical application of the general principles of the revolutionary ideology to which both radicals and moderates adhere. Radicalism is favored also by the dynamic character of the revolutionary situation; it is not easy to move large masses to action, but it is equally difficult to stop them once they have been set in motion.

Desertions to the radical camp weaken the moderates and leave them oscillating helplessly between the right and the left. The growth of the extreme left appears to force the moderates into closer union with reaction, the traditional guardian of law and order; but a move to the right threatens further to disorganize and reduce the ranks of the moderate party. For the moderates fear the friendship of their old enemies even more than the enmity of their old friends; on the whole they regard the radical as a brother in arms who must be convinced of his errors rather than as a foe to be destroyed—an emotional handicap of which radicalism is entirely free.

As radicals seize power they have to contend with a strengthened and unified opposition. All those who fear the loss of privileged or preferred status are now joined in the fight against the common enemy. In this antiradical camp the differences among the various groups—the ultra-reactionaries, the revolutionists by adoption and the moderates—now tend to disappear. Furthermore there is the potent threat of intervention by foreign powers. Under such conditions it is fatal to falter or to hesitate. If the radicals are to retain control of the situation they must at once secure an organized force capable of defending the revolution: a Committee of Public Safety, a Cheka, a New Model Army that can combat the armies of foreign states ruled by reactionary governments and break up the dangerous alliance between domestic and foreign counter-revolution.

These developments will necessarily influence the outlook of revolutionary radicalism. Impelled by the dynamics of struggle, not by opportunistic compromises as in the case of the moderates, radicalism temporarily moves away from its final goal of a classless and harmonious society. At this point there is need of a theory of "the transition period" which will reconcile the contradictions between the final goal and the means used to attain it. Such, for example, was Robespierre's doctrine that "the despotism of liberty against tyranny" is necessary in order to prepare the ground for a free egalitarian society. The dictatorship of the proletariat is, according to Marx and Lenin, the inevitable link between capitalism, a society in which antagonistic forces reach their highest development, and socialism, the first social order based on principles of solidarity.

Even more significant are the structural changes in a country where a radical revolution has achieved victory. While the elements which constituted the old society have disappeared, the groups which have been in the ascendant have become exhausted by their prolonged struggles in the defense and consolidation of the revolution. A condition develops which is not unlike that produced by a victorious counter-revolution: it appears that an enormous and powerful state machine is now free to disregard the interests and wishes of society or of any groups within it. In control of such a machine the conservative landlord Bismarck could create the German Empire and the communist revolutionary Lenin introduce the New Economic Policy.

A radical revolution does not travel directly to its announced goal and it exacts a heavy toll in human life and suffering; but the transformations it effects are more fundamental and permanent than those achieved at smaller cost under the leadership of moderates. Neither the Thermidor reaction nor the Bourbon Restoration modified in any important particular the structure of French society as established by the revolution; and that social system might not have been so firmly intrenched if the Jacobin dictatorship had not saved the revolution from the cul-de-sac into which it had blundered.

RHETT, ROBERT BARNWELL (1800-76), American statesman. In 1837 Rhett, dropping his parental name of Smith, assumed the name of a colonial ancestor whose male line had become extinct. When in the same year he entered Congress as representative from South Carolina, he had completely formulated the political creed to which he adhered steadfastly during the rest of his life. He was devoted to the older variant of the doctrine of states' rights which in emphasizing the sovereignty of the state repudiated both the legal hegemony of the union and the ethical hegemony of a section. Rhett's aggressive localism coincided with the emergence in the South of a new attitude, essentially nationalistic, which was designed to draw all the southern states into a close association and to determine the policy of each by the welfare of all. His opposition to all centralizing tendencies whether on a sectional or on a national scale is reflected in the important events of his life. Shortly after entering Congress he became an avowed secessionist. The "Bluffton Movement," precipitated by a speech which he made at Bluffton, was an attempt, frustrated by Calhoun, to argue his state out of the union as the first step toward a southern confederacy which would include Texas. Following the Compromise of 1850 Rhett eagerly participated in another attempt to break the union. The "Southern Nationalists" withdrew from this movement when they found that the South as a whole was not ripe for secession, but Rhett stuck to his guns to the bitter end. Soon after the failure of this movement he retired to private life; he issued forth again, however, as the secessionist leader of South Carolina in 1860, and considerable efforts were made to elect him president of the Confederacy. When his successful rival, Davis, entered upon his work of administrative centralization, Rhett became his bitter opponent. During the remainder of Confederate history he took part in every effort to limit the power of the administration and to exalt that of the separate states. After the downfall of the Confederacy he lived in retirement.

RHIGAS, KONSTANTINOS (c. 1757-98), Greek nationalist and poet. Very little is known of Rhigas' life until about 1790, when he left his native land for Bucharest. He was a student there for several years and later became secretary to the hospodar. While in Bucharest he organized a group to promote a Greek revolt against Turkish absolutism and in order to further the movement went to Austria, where he won the support of many of the Greek merchants in Vienna and Trieste. During this period he had his revolutionary poems and writings distributed secretly throughout Greece. Rhigas was greatly influenced by French revolutionary doctrines and was negotiating with Napoleon for assistance in the Greek cause when, together with several friends, he was arrested by the Austrian government. He was handed over to the Turks and put to death.

Rhigas played a preeminent part in developing an ideological basis for the Greek revolutionary struggle. His works were read extensively and stimulated a revival of nationalist sentiment. His purpose was the liberation not only of Greece but of the entire Levant from the sultan's yoke. In this connection he gave expression for the first time to the idea of a Balkan league, which was to include the Levant of Asia Minor. All Rhigas' writings, with one exception, have a socio-pedagogical and political content. Of special importance are his celebrated *Song of Freedom*, which sought to incite to revolution not the Greeks alone but all the subjects of the sultan, and his *Proclamation on Liberty, Equality and Fraternity*, which contained a detailed plan for the constitution of the new state. The *Proclamation* was influenced chiefly by the French constitution of 1793, although many of its precepts are reminiscent of the constitutions of 1791 and 1795 as well as of those proposed by Sieyès and Condorcet. It is distinctive, however, because of its deliberately cosmopolitan point of view: it speaks only of "the rights of man" and not of the "rights of citizens," for in the new state citizenship was to be a necessary qualification only for positions in

the public administration and otherwise all were to enjoy equal rights and privileges.

PANAJOTIS KANELLOPOULOS

Consult: Edmonds, E. M., *Rhigas Pheraios* (London 1890); Nicolapoulos, C. A., *Notice sur la vie et les écrits de Rhigas* (Paris 1824).

RHODES, CECIL JOHN (1853–1902), English empire builder and colonial statesman. As a young man Rhodes went to south Africa for his health and became interested in the diamond diggings at Kimberley. His business career culminated in the consolidation of these diamond fields in the hands of the De Beers Mining Company. Rhodes had already entered political life at Cape Colony, had aided in establishing British power in Bechuanaland and, like others, had foreseen eventual expansion of British power to the north. In 1889 he organized the British South Africa Company, chartered by the crown, which with De Beers funds undertook to establish a British colony in what is now Rhodesia, anticipating apparent Boer, Portuguese and German aims in this direction. Meanwhile Rhodes became prime minister of Cape Colony and also began the development of deep level mines on the Rand through the Consolidated Gold Fields Company. His native policies both at the Cape and in Rhodesia have been much criticized. With respect to the Boers he advocated a South African policy which would promote a federal union of all states with unified railway and tariff control. Impatient to achieve his ends, he planned a revolt at Johannesburg against Boer rule, sustained by Rhodesian forces. The abortive Jameson raid brought his program to a sudden end in 1896. Rhodes continued to wield power unofficially in his northern domains, aided in suppressing a serious Matabele uprising and projected telegraph lines and railways along the Cape to Cairo route. At the Cape he was leader of a pro-British party, which greatly exacerbated Dutch-English relations and strengthened the resolution of the Boer republics to resist British encroachments. The Boer War curbed his independence of action and his influence upon the course of events.

Despite numerous biographical works by associates the personality of Rhodes remains something of a mystery. He was clearly a man of mystical temperament, with few close friends, attached to mediocrities, more captivated by a South African than by a British view of empire and desirous of wealth as a means of power. The publication of his will with its provision for

scholarships at Oxford for British, American and German students encouraged the rapid rise of Rhodes legends which serve as a gloss for the ruthlessness of his methods. Rhodes symbolizes the mixture of sharp business practise and political ambition which characterized the expansion movement of the last quarter of the nineteenth century. His fortune arose from shrewd exploitation of native labor and his power was a function of the expansion movement itself, which shaped his personality and made him its boldest and most imaginative leader.

LELAND H. JENKS

Consult: Cecil Rhodes; *His Political Life and Speeches*, ed. by "Vindex" (F. Verschoyle) (London 1900); Mitchell, Lewis, *Life and Times of the Right Honourable Cecil John Rhodes*, 2 vols. (London 1910); Williams, Basil, *Cecil Rhodes* (London 1921); Millin, S. G., *Cecil Rhodes* (London 1933); Plomer, W. C. F., *Cecil Rhodes* (London 1933); Harris, John H., *The Chartered Millions* (London 1920); Hole, H. M., *The Making of Rhodesia* (London 1926).

RHODES, JAMES FORD (1848–1927), American historian. Rhodes, after having spent a year each at New York University and Chicago University, returned to his native city of Cleveland, Ohio, to enter the coal and iron business which his father had built up. For the next fifteen years he was associated with his brother-in-law, Mark Hanna, and succeeded in collecting a comfortable competence. In 1885 he was able to retire, and after more than a year spent in European travel he set about his life work, residing first in Cleveland, then in Cambridge, Massachusetts, and after 1899 in Boston.

Selecting the Civil War period as his field Rhodes published in 1893 the first two volumes of his *History of the United States from the Compromise of 1850* (7 vols., New York 1893–1906; new ed., 9 vols., 1928). The year 1877 had been set as the original goal of his history, but in 1919 Rhodes published also the *History of the United States from Hayes to McKinley, 1877–1896* and in 1922 *The McKinley and Roosevelt Administrations, 1897–1909*. In 1917 there appeared his one-volume *History of the Civil War*, which Rhodes called "not an abridgement . . . but a fresh study of the subject." Between 1885 and 1927 he wrote various short essays on historical subjects, some of which were incorporated into his later books.

Rhodes' fame as a historian rests upon his original volumes, especially the first five. These are not so much a history of the United States

as a chronicle of the slave struggle and particularly of its political aspects. Despite the fact that he was a northerner and a Republican in politics and had been brought up in a section where abolitionist sentiments had been pronounced, he gave a remarkably unprejudiced presentation of the southern position. Rhodes had a real flair for the picturesque and spectacular, and his pages abound in graphic descriptions of some of the more sensational events of the period he was treating; his pen portraits of political and military personages are also noteworthy. His earlier work was built up painstakingly on diligent study of the sources with much utilization of the newspapers; and although later scholarship has succeeded in questioning some of his conclusions, his history still stands as the best single, detailed study of the political and military events of the years 1850 to 1877.

Rhodes' lacunae were serious, however, and prevent his history from being a true record of all the main currents of American national life from 1850 down to the close of reconstruction. For example, he showed no awareness of the nature of the economic antagonisms between the southern slavery and the growing northern capitalistic class; while he scarcely noticed the influence of the west in the shaping of the politics leading up to the Civil War. The diplomatic, naval and general social aspects of the Civil War period were slighted also. His two volumes covering the years 1877-1909 are generally unsatisfactory, and they prove that Rhodes in his own times was quite at a loss as to the true significance of industrial and financial growth and organization, the rise of labor groups and struggle, and agrarian discontent.

RICARDO, DAVID (1772-1823), English economist. Ricardo was born in London of Anglo-Jewish parents. He passed his childhood in a restricted world of civic security, material well being, religious orthodoxy and social exclusion. Destined for a financial career, he was sent as a young boy to a school in Holland, where he

remained for two years. Upon his return to England he continued to receive a common school education, until at fourteen his father began to employ him in the brokerage business. Soon after attaining his majority Ricardo married Priscilla Anne Wilkinson, a non-Jewess. Whether in consequence of this step or in general reaction against the rigid orthodoxy of his father's religious practise, a rupture occurred between father and son extending even to business affairs. Thrown upon his own resources, Ricardo displayed exceptional capacity in the money market and within a short time had established himself securely. Outside of business affairs natural science seems at first to have interested him. He was one of the original members of the Geological Society and made a collection of minerals.

The sensational events which led up to and followed the Bank Restriction Act of 1797 and the ordinary happenings of his everyday life on the Stock Exchange could not have failed to interest Ricardo in general financial principles. Yet the determining impulse to economic speculation came from almost chance acquaintance in 1799 with Adam Smith's treatise. Ricardo's debut as an economic writer took the modest form of an unsigned paper on the bullion controversy, contributed in 1809, at James Mill's instance, to the *Morning Chronicle* and subsequently expanded into a forceful pamphlet, *The High Price of Bullion* (London 1810). It led to intimacy with Malthus and upon the incorporation of its substance into the bullion committee report of 1810 established Ricardo as a convincing exponent of monetary principles and an authoritative champion of "the true doctrine" against contemporary attack.

The corn law controversies of 1813-15 brought Ricardo again to the fore, first as a pamphleteer advocate of free trade principles in opposition to the protectionist leanings of Malthus, and later as an author of a systematic theory of economic distribution and tax incidence. Greater intimacy with James Mill, active correspondence with Malthus, Trower, McCulloch and Say and retirement from the stock exchange to the tranquil ease of a Gloucestershire country seat in 1814 tended to broaden the range of Ricardo's economic thinking and culminated in the publication of his *On the Principles of Political Economy and Taxation* (London 1817, 3rd ed. 1821). In 1819 Ricardo entered the House of Commons as member for Portarlington, an Irish pocket borough, and

parliamentary issues became his prime interest. Formal duties were supplemented by participation in current discussion: resumption of specie payment, bank practises, tax proposals, sinking fund policy, Owen's schemes, savings banks and popular education projects.

Much of present day wisdom with respect to currency, taxation and international trade is based upon Ricardo's analyses. In the matter of currency Ricardo's service was not merely to confirm and amplify earlier opinions but to co-ordinate them with actual monetary practise. He inspired the bullion committee report of 1810; his advocacy of disassociating issue from discount functions foreshadowed the bank act of 1844; and his "economical and secure currency" has become the monetary system of enlightened states. In the field of taxation Ricardo must be credited with the current acceptance of the principles that the social utility of any tax is determined not by its productivity but by its ultimate incidence and that this effect is governed by the laws of economic distribution; these considerations have become the fundamental criteria of all modern testing of tax proposals. The theory of international trade as left by Ricardo and expounded but not substantially altered by J. S. Mill has furnished the scientific basis for the practical rule of free trade.

There is a certain superficial warrant for the widespread opinion that the economic radicalism of the nineteenth century is an emanation of the Ricardian economics. Socialism, both in its earlier English phase and as developed by Rodbertus and Marx, rests upon the assumption that value is "embodied labor"; the appropriation by the state, wholly or in part, of economic land rent, either as a social panacea as urged by Henry George or as a fiscal device as contemplated by recent tax reforms, is based upon the differential theory of rent formulated by Malthus and accepted by Ricardo. Careful students have, however, distinguished between Ricardo's opinions and the misinterpretation or outright perversion of them. Ricardo accorded a place to "embodied labor" not as the cause but as the measure of value. So too in the matter of economic rent he insisted that with the progress of society capital tended to increase, and in consequence of limitation upon the productive capacity of the soil profits tended to fall and rents to rise; but he maintained that these phenomena, far from betokening any social injustice, were "the most unequivocal truths of wealth and prosperity."

Critics differ as to the validity of Ricardo's doctrines. There is little dissent as to his high service in establishing the concept of political economy as a body of uniformities dealing with the phenomena of wealth. His data may have been incomplete, his method in part defective, his conclusions at times misleading, but Ricardo's great contribution lay in his definitive conversion of economic speculation from detached inquiry or specific theorization into an integrally related body of principles. To this extent Ricardo is to be regarded as the true founder of the science of economics. With respect to particular principles—the theory of money, the laws of fiscal incidence, the scheme of economic distribution—Ricardo's contributions were important. But it is in the large influence of concept and method that the explanation of his dominance is to be found.

JACOB H. HOLLANDER

Works: Works of David Ricardo, ed. by J. R. McCulloch (London 1846). For Ricardo's letters to J. B. Say, see "Correspondance avec David Ricardo" in Say's *Oeuvres diverses* (Paris 1848) p. 406-29; *Letters of David Ricardo to Thomas Robert Malthus, 1810-1823*, ed. by James Bonar (Oxford 1887); *Letters of David Ricardo to John Ramsay McCulloch, 1810-1823*, ed. by J. H. Hollander, American Economic Association, Publications, vol. 8, nos. 5-6 (New York 1895); *Letters . . . to Hutches Trower and Others, 1811-1823*, ed. by J. H. Hollander and James Bonar (Oxford 1899); *Three Letters on the Price of Gold, Contributed to the Morning Chronicle in August November 1809* (Baltimore 1903); *Notes on Malthus' "Principles of Political Economy,"* ed. by J. H. Hollander and T. E. Gregory (Baltimore 1928); *Minor Papers on the Currency Question 1809-1823*, ed. by J. H. Hollander (Baltimore 1932). A definitive edition of Ricardo's writings is in preparation by the Royal Economic Society.

RICCA-SALERNO, GIUSEPPE (1849-1912), Italian economist. Ricca-Salerno was professor of finance at the University of Pavia and later taught economics at Modena and Palermo. His early works, notably *Sulla teoria del capitale* (Milan 1877) and *Teoria generale dei prestiti pubblici* (Milan 1879), attracted attention for their remarkable critical insight. In his monograph "La teoria del valore nella storia delle

dottrine e dei fatti economici" (in R. Accademia dei Lincei, Classe di Scienze Morali, *Memorie*, 5th ser., vol. i, Rome 1893, p. 137-305) Ricca-Salerno attempted to integrate the value theory of the Austrian school with that of the classical economists and contributed original observations on monopoly value. Of fundamental importance is *La teoria del salario* (Palermo 1900), presenting a most effective combination of deductive reasoning and factual analysis, in which he applied the doctrine of reciprocal demand to capitalist exchange between entrepreneurs and workers and treated the problem of distribution of wealth in its general and particular aspects.

Ricca-Salerno is to be remembered also for his contributions to fiscal science. His "Storia delle dottrine finanziarie in Italia" (first published in R. Accademia dei Lincei, *Memorie*, 3rd ser., vol. ix, Rome 1881; 2nd ed. Palermo 1896) is outstanding for its scope of analysis, its coordination of doctrine and fact and its comparison of Italian with foreign fiscal doctrines. No less important is the *Scienza delle finanze* (Florence 1888, 2nd ed. 1890), valuable for its economic analyses of fiscal in relation to political conditions, in which he departed from the concepts of Emil Sax and modified some of the latter's propositions; this study contains also a critical, synthetic exposition of the tax systems, pointing out their essential tendencies and principal relationships. Ricca-Salerno wrote numerous economic and fiscal monographs, most of which have been published in Italian and foreign reviews. His more general essays "Le entrate ordinarie dello stato" and "Finanze locali," published in *Primo trattato completo di diritto amministrativo italiano* (ed. by V. E. Orlando, vol. ix, Milan 1902, p. 1-386 and 685-899), treat the problems of fiscal jurisprudence in the light of the general principles of fiscal science.

AUGUSTO GRAZIANI

RICCI, MATTEO (1552-1610), Italian Roman Catholic missionary. Ricci was born in Macerata. As a young man he entered the Society of Jesus and in 1577 was sent to the Jesuit missions in the east of Asia. After about four years in India he was assigned to China, reaching there in 1582. During the preceding thirty years courageous but largely ineffective attempts had been made to renew Roman Catholic missions in the Middle Kingdom; were they had lapsed for more than two centuries. It was due largely to Ricci that these efforts succeeded. By slow stages covering many years he made his way to

Peking (1601), where he resided until his death. In order to gain a foothold for Christianity in the country he addressed himself primarily to the dominant scholar-official class, winning their respect by showing that he possessed greater knowledge than they in mathematics and astronomy, subjects in which he had specialized in Europe. With the same end he made himself expert in the Chinese language and literature. Desiring to avoid antagonizing this ruling class, he adopted the garb of a Confucian scholar, employed in his translation of the word God the terms *T'ien*, *Shang-ti* and *T'ien chu*, which he found in the ancient classics, and decided that such ceremonies as those customarily employed in honor of ancestors could consistently be engaged in by Christians. It was his approach which most Roman Catholic missionaries in China were to adopt for more than a century after his death. After prolonged controversy some of his adaptations to Chinese customs and terms were forbidden by Rome. His appeal to the governing groups through western science, however, continued until early in the twentieth century. The precedent which Ricci set for missionaries in studying Chinese lore laid the foundations for European Sinology.

RICHARD, HENRY (1812-88), the foremost figure in the nineteenth century British peace movement. The son of a Welsh Calvinistic minister, Richard in 1835 became pastor of Marlborough Chapel in London. For almost forty years he served the London Peace Society as its most active and responsible officer. With Elihu Burritt (*q.v.*) he organized a series of popular peace congresses in Great Britain and on the continent. As editor of the *Herald of Peace* (1848-84) and the *Morning Star* and *Evening Star*, the former of which contains his most important writings, he vigorously exposed "war scares" and professional patriotism, denounced the Crimean War and condemned imperialism. As a Liberal member for Merthyr Tydfil (1868-88) he was the leading exponent of the peace movement in the House of Commons. His program included the reform and codification of international law, parliamentary control over the declaration of war, and the reduction of

armaments. The heart of his proposals, however, was the establishment of a general and permanent system of arbitration, and to this he committed the House in 1873 notwithstanding the opposition of Gladstone. His influence also led directly to the adoption of similar resolutions in several continental legislative bodies. Despite the Christian inspiration of his thoroughgoing pacifism he did much to make the peace movement less religious and sentimental and more political in character.

In his associations with revolutionary liberalism of the continental type Richard insisted that the Christian principle of non-violence was even more applicable in civil than in international war. His middle class point of view also made him unsympathetic with various revolutionary movements which appealed dramatically to the masses of Europe in the name of "peace and liberty." An outstanding mediator between Wales and England, he won the admiration of Welshmen for his stanch defense of nonconformist interests, religious liberty and popular education in the land of his birth.

MERLE E. CURTI

RICHELIEU, ARMAND-JEAN DU PLESSIS DE (1585-1642), French cardinal and statesman. Richelieu was born in Paris, took holy orders and in 1607 was made bishop of Luçon. He was a member of the clerical estate in the Estates General of 1614 and through Concini's intercession was made secretary of state in 1616. He received the protection of Marie de Médicis and was elevated to the rank of cardinal in 1622. In April, 1624, he became a member of the council of state; here, thanks to the unwavering confidence of Louis XIII, he remained in unchallenged primacy until his death.

Richelieu has been recognized unanimously as one of the most extraordinary political geniuses the world has known. His policies often varied, but he knew how to avoid extreme solu-

tions and he always persevered in his endeavors regardless of the obstacles in his way. He had two chief aims, to make the king of France actual master of the entire realm and to assure him of hegemony over Europe. This twofold objective explains his policy of subjugating the nobles and removing them from the government, as well as the fact that he suppressed the Huguenots as a political party while he made no attempt to encroach upon their liberty of conscience or worship. He developed the institution of intendants and augmented their powers, abolished a large number of local privileges and contributed more than any other individual to making France a centralized state under royal domination. He has been criticized very severely, however, for his failure to correct the faults of the financial administration. In foreign affairs Richelieu's policy was to remove the Hapsburgs from their position of supremacy in Europe. He supported the Protestant princes of Germany in the Thirty Years' War and assured for France the definite conquest of Alsace, Artois and Roussillon. His designs in the colonial sphere were no less grandiose. Aiming to vest in France control of the seas he created numerous commercial companies in Senegal, Madagascar and Canada and encouraged emigration and colonization. In his economic policies he followed the doctrine of national interests in espousing the cause of mercantilism. Richelieu was also an outstanding patron of art and literature; the founding of the Académie Française in 1635 depended in large measure upon his support and cooperation.

RICHMOND, MARY ELLEN (1861-1928), American social worker. The professional life of Mary Richmond represents in epitome the history of the charity organization movement and the establishment of social case work technique in the United States. When Miss Richmond assumed the general secretaryship of the Baltimore Charity Organization Society in 1891, that movement was well under way, but it reached its full development in the course of the next two decades and largely under her leadership.

Miss Richmond's work and writings went through three distinct although overlapping stages, each decisive for social work and particularly for the field of family case work. The first of these centered on the promotion of the charity organization program as a whole, in which the coordination of charitable efforts in the community occupied at least an equal importance with the individualization of service. The second stage was devoted to social case work, its formulation, elucidation and development. This stage reached its fruition in *Social Diagnosis* (New York 1917) and ended with the publication of *What Is Social Case Work?* (New York 1922). The former is significant for its emphasis on multiplicity of causation of social problems in the community, the need for investigation and critical use of social evidence, as well as for its insistence on the scientific method and on a practical appreciation of the fact that the individual case reflects dynamically the entire social environment. In the latter book the concept of social case work is focused increasingly on psychological aspects, in contradistinction to the sociological emphasis of the earlier view. Social case work is here defined as consisting "of those processes which develop personality through adjustments consciously effected, individual by individual, between men and their social environment." At this point social case work development received a fresh impetus from the new movement of mental hygiene and from the emerging theories of psychoanalysis, and Miss Richmond shared leadership with these influences. The third stage of her interests—a concentration on the family as a cultural unit and as a social institution requiring protection and enrichment—was reflected in her study of marriage laws and their administration from the viewpoint of safeguarding family life and re-

sulted in the publication of *Child Marriages* (New York 1925) and *Marriage and the State* (New York 1929), both written in collaboration with Fred S. Hall.

In 1909 after having served nine years as general secretary of the Philadelphia Society for Organizing Charity (now the Family Society of Philadelphia) Miss Richmond went to New York, devoting the remaining years of her life to research under the auspices of the Russell Sage Foundation.

Although she was largely self-educated, her intellectual powers, imagination and philosophical grasp placed her among the leading contemporary social scientists. She was among the first to advocate the establishment of professional schools of social work and taught in the earliest of them in New York.

PHILIP KLEIN

Consult: Richmond, Mary E., *The Long View, Papers and Addresses*, ed. by Joanna C. Colcord and Ruth Z. S. Mann (New York 1930), with bibliography p. 621-23; Colcord, Joanna C., and others, in *Family*, vol. ix (1928-29) 319-50; Klein, Philip, "Mary Richmond's Formulation of a New Science" in *Methods in Social Science*, ed. by Stuart A. Rice (Chicago 1931) p. 95-106; Robinson, Virginia P., *A Changing Psychology in Social Case Work* (Chapel Hill, N. C. 1930), especially chs. v-vi; "Mary E. Richmond, 1861-1928" in *Survey*, vol. lxi (1928-29) 69-70.

RICHTER, EUGEN (1838-1906), German political leader. Richter was born in Düsseldorf. His bold criticism of the Prussian administration during his youth brought him into conflict with the government and as a result he was cut off from a career in the government service. When in 1864 his election to the office of burgo-master failed to receive official confirmation, he decided to become a political publicist. In this capacity he exerted a powerful influence in Germany for many decades, more as a result of his critical objectivity than because of the brilliance of his literary style. During his early years he took an active part in the founding of many social, political and educational organizations of the Prussian liberal opposition. In 1867 he was elected to the Reichstag, where together with Windhorst, the leader of the Center party, he became the most consistent and obstinate opponent of Bismarck in matters of domestic, financial and economic policy. Richter took very little interest in questions of foreign policy, concentrating most of his attention on domestic affairs. He was the spokesman of determined liberalism, advocating cooperative self-aid and bourgeois laissez faire as opposed to state inter-

vention in economic matters and a state system of social welfare work. As a determined opponent of every form of state socialism and national mercantilism he came into open hostility to the Social Democratic movement. His historical position in German history is based on his inexorable and expert criticism of étatism. He was distinguished by his diligence in mastery of detail, his quick wit as an orator, his untiring persistence in attack and his vigorous defense of bourgeois liberalism. His influence on the general development of the liberal parties in Germany was negative. With all his devotion to the cause, he was thoroughly authoritarian, mistrustful and harsh. The divisions in the German liberal parties are partly the result of his lack of conciliatory spirit. Had he not remained in the opposition, he might have achieved positive results through his excellent plans for state financial and administrative organization instead of being overshadowed by the more illustrious Bismarck.

THEODOR HEUSS

Consult: Rachfahl, F., "Eugen Richter und der Links-liberalismus im neuen Reich" in *Zeitschrift für Politik*, vol. v (1911-12) 261-374; Ullstein, L., *Eugen Richter als Publizist und Herausgeber*, *Das Wesen der Zeitung*, vol. ii, pt. i (Leipzig 1930); Röttger, H., *Bismarck und Eugen Richter im Reichstag 1879-90* (Munster 1932).

RICHTER, JOHANN PAUL FRIEDRICH (Jean Paul) (1763-1825), German author. Richter was the son of a poor village preacher and was brought up under conditions of extreme poverty. He is practically the only great figure in classical German literature in whose works the lower classes play a significant role. In his idyllic tales (*Schulmeisterlein Wuz*, *Quintus Fixlein*, *Fibel* and others) he portrayed with intimate familiarity and kindly humor the life and pursuits of the small schoolmasters, village clergy and petty bourgeoisie. In his more ambitious novels he wrote of the life of the upper classes, particularly of the court and nobility. These he treated with biting satire, even though in his later years he enjoyed familiarity with them. His profound sympathy and feeling of social responsibility, as expressed, for example, in his *Leichenrede auf den Bergmann Zaus* (1796) and *Leichenrede auf die Jubelmadg Regina Tanzberger in Lukas-Stadt* (1822) led Börne to call him the "advocate of the poor and poet of the humble." Richter did not, however, conceive it to be his task to inspire among the lower classes dissatisfaction with their lot. On the other hand, he

tried to show that happiness can prevail even in poverty and that whereas the lesser joys available to the poor are genuine and valuable, riches and luxury usually bring discontent and unhappiness. He demanded that the harmless pleasures and occasional excesses of the lower classes should not be limited or misjudged and that they should not be hindered by narrow censorship measures and petty bureaucratic methods in their attempt to gain access to the treasures of culture and opportunities of advancement. It is one of the many contradictions characteristic of Jean Paul that despite his friendliness toward the lower classes his works are quite the reverse of folk literature; because of his heavy style burdened with learned technical expressions and allusions his writings appeal only to the educated. Also in his chief pedagogic work, *Levana* (2 vols., 1807; English translation, London 1848), unlike his contemporary Pestalozzi, he directed his attention chiefly to the upper classes. Although he was in many respects a faithful disciple of Rousseau, whom he venerated both as a man and as a writer, he was not of a revolutionary nature. He hailed the French Revolution at first with enthusiasm but, like most Germans of his time, he later turned away from its extreme manifestations. He took for granted for the most part class differences as well as the cleavage between educated and uneducated and hoped that a more equitable adjustment would come, not so much from the abolition of material or political inequalities as from mutual understanding and sympathy. The "young Germans" were therefore only partly justified when they set him up as the "democrat" against the "aristocrat" Goethe. With all his opposition to encroachments by the upper classes he retained for the most part the social attitudes of his time.

EDUARD BEREND

Works: *Werke*, 60 vols. (Berlin 1879); *Sämtliche Werke*, ed. by Eduard Berend, 1st ser., vols. i-ix, 2nd ser., vols. i-iii (Weimar 1927-33).

Consult: Berend, Eduard, *Jean-Paul-Bibliographie* (Berlin 1925); Alt, Johannes, *Jean Paul* (Munich 1925); Harich, Walther, *Jean Paul* (Leipzig 1925); Müller, Josef, *Jean Paul und seine Bedeutung für die Gegenwart* (2nd rev. ed. Leipzig 1923).

RIDGEWAY, SIR WILLIAM (1853-1926), Irish archaeologist. Ridgeway, who was born in King's county, Ireland, was educated at Trinity College, Dublin, and at Gonville and Caius College, Cambridge. He was appointed professor of Greek in Queen's College, Cork, in

1883 and Disney professor of archaeology in Cambridge in 1892. His *The Origin of Metallic Currency and Weights Standards* (Cambridge, Eng. 1892) combined a grasp of detail and an erudition remarkable even among classical scholars with a breadth of interest rare among them. In refusing to reason as though Greece were a province set in a vacuum apart from the civilization of the world he put himself in advance not only of his own generation of classicists but even of later ones. He did not despise light shed upon Greece even by the cultures of peoples generally regarded as barbarous and beneath notice. His weakness, common to archaeologists, was that he relied too much on direct evidence, cking out its blanks with conjectures often based on a false psychology of primitives. In 1901 he embarked with increased power on a larger task, the reconstruction of prehistoric Greek culture (*The Early Age of Greece*, 2 vols., Cambridge, Eng. 1901-31). *The Origin of Tragedy* (Cambridge, Eng. 1910) was followed by *The Dramas and Dramatic Dances of Non-European Races* (Cambridge, Eng. 1915). In the latter volume he contended, after a vigorous critique of conflicting theories, that totemistic beliefs are dependent on the primary belief in the immortality of the soul; that men first pray to the dead and not to abstract spirits for rain and good crops; and that tragedy, including Greek tragedy, arose out of dramatic dances in honor of the dead.

Ridgeway turned research into a battle ground; his combative spirit made enemies but it vivified his vast learning and placed the Cambridge Department of Archaeology and Anthropology in the forefront of adventurous research.

RIDOLFI, MARCHESE COSIMO (1794-1865), Italian agriculturist and statesman. Ridolfi, who was a noble Tuscan landed proprietor at Meleto, early interested himself in scientific methods of cultivation and in agricultural education. He improved his own estates, founded the famous agricultural school at Meleto in 1834 and the Istituto Superiore di Agraria at Pisa in 1842, was professor of agronomy at the University of Pisa from 1840 to 1845 and was outstanding in the activities of the Accademia dei Georgofili for half a century. Ridolfi also took a prominent part in the liberal right politics of

Tuscany and later of the Kingdom of Italy. The author of some four hundred pamphlets and articles, he was not a theoretical economist but a statesman with a clear program of economic policy. This program, deriving from Sallustio Bandini and the Tuscan tradition of agricultural free trade and linked with the post-Smithian literature, which Ridolfi knew intimately, stressed the importance of agriculture for the attainment of Italian economic prosperity. As an agronomist he helped in the perfecting of the method of cultivation called the *colmata di monte*; this technique of piling up the earth in terraces for the purpose of reclamation has been of great importance to Tuscan agriculture.

JACOPO MAZZEI

Important works: *Prologo alle lezioni di agronomia e pastorizia* (Florence 1843); *Lezioni orali di agraria in Empoli*, 2 vols. (Florence 1857, 3rd ed. 1860); *Annunzio della fondazione di una scuola di insegnamento reciproco: utilità e piano della medesima* (Florence 1810); *Sulla libertà del commercio frumentario* (Florence 1825); *Rendiconto economico rurale dell'Istituto agrario di Meleto* (Florence 1841). For complete bibliography see Ferrari, Prospero, *Scritti del Marchese Cosimo Ridolfi* (Florence 1899).

K., *Riccioli and the Risorgimento in Tuscany* (London 1926).

RIEGER, FRANTIŠEK LADISLAV (1818-1903), Czech nationalist leader. Rieger is a representative of the transition period in the evolution of Czech nationalism from its beginning as a literary revival in the early nineteenth century to its culmination in a fully developed national life toward the end of the century. He first came into prominence as one of the leaders in the revolutionary movement of 1848 and acquired wide renown as orator while serving as member of the Austrian parliament in Vienna and Kroměříž. When the parliament was suppressed in March, 1849, by the reactionary government which shut the door to all liberal and democratic policies for a decade, Rieger visited France and England, studied economics and after his return to Bohemia undertook in 1858 the editing of a Czech encyclopaedia, *Slovník naučný*. He organized the Czech national theater in Prague and many other cultural institutions of the reawakened nation but devoted his attention mainly to politics. In 1859 he wrote in Nice a pamphlet, *Les slaves d'Autriche et les Magyars* (Paris 1861).

to inform European statesmen concerning Austria and its nationalities.

With the resurrection of parliamentarism in Austria in 1860 Rieger again resumed the political leadership of his people. The difficult position of the nation, which since 1620 had been forcibly deprived of political independence and but slowly achieved modern political consciousness during the nineteenth century, along with the mighty political pressure of the absolutist dynasty, the feudal lords and the pseudo-liberal Germans and Magyars of Austria combined to defeat him on many occasions and finally to undermine his once enormous popularity. Yet, when in 1891 his party was wiped out by the radical Young Czech party, the general political, economic and cultural position of the nation had advanced markedly from the beginning of Rieger's career.

Rieger), compiled by Jan Heidler, *Česká Akademie Věd a Umění, Historický Archiv*, vols. xlv-xlv, 2 vols. (Prague 1924-26); Leget, Louis, in *La renaissance tchèque au dix-neuvième siècle* (Paris 1911) p. 160-205.

RIEHL, WILHELM HEINRICH (1823-97), German historian and sociologist. Riehl began his career as a journalist but was appointed professor at the University of Munich in 1854, first to teach political science and in 1859 to teach *Kulturgeschichte*. His studies in folklore and cultural history have ranked him with Jakob Burckhardt and Gustav Freytag as one of the chief representatives of that field in nineteenth century Germany. Riehl was not a systematic worker and he never developed a definite methodology. His information was for the most part gathered on numerous travels through southern and central Germany.

Riehl's concept of cultural history was that of the "history of the entire civilization [*Gesamt-gesittung*] of nations as revealed in their art, literature, science and economic, social and political life." He often spoke of a "universal cultural history of mankind" and of a "recognition of the Spirit in history" and he also called cultural history the true philosophy of history. Riehl's own works, however, reveal a preoccupation only with the static elements and not with the movement of events and the interrelationship of all life throughout history. He opposed the use of the statistical method because he believed that great personalities and not the

masses were the decisive factors in history. From the romantic movement he derived his view of the nation and the "immutable" national spirit as the basic elements in historical development. While he often hinted at laws of history and spoke of his desire to establish the natural laws of the life of a people as determined by the struggle between necessity and freedom, he never developed these ideas in full. His specialized fields of study were folk life, the plastic arts and music; but even in these fields he never investigated the more general relationships. He was at his best in describing the conditions in the German local states of the seventeenth and eighteenth centuries.

Riehl's significance is perhaps more important in connection with the development of sociology. By virtue of his studies of German society in the middle of the nineteenth century, based on personal observations and a thorough study of the family, Riehl must be considered, with Lorenz von Stein, as the founder of sociology in Germany. Stein excelled in his general theories of philosophy of history, Riehl in his description of customs and institutions within a limited region.

WALTER GOETZ

Chief works: *Kulturstudien aus drei Jahrhunderten* (Stuttgart 1859, 7th ed. 1910); *Kulturgeschichtliche Charakterköpfe* (Stuttgart 1891, 3rd ed. 1899); *Freie Vorträge*, 2 vols. P., *History and Historians in the Nineteenth Century* (London 1913) p. 574-77.

RIESSER, GABRIEL (1806-63), German-Jewish liberal leader and protagonist of Jewish emancipation. Riesser was born in Hamburg. He studied law but as a Jew was refused a lectureship in Heidelberg and admission to the bar in his native town. In 1830 he published *Über die Stellung der Bekenner des mosaischen Glaubens in Deutschland* (Altona, 2nd ed. 1831), demanding for the first time full emancipation for the Jews; this pamphlet was followed by other writings and by the publication of *Reis-*

ser's periodical *Jude* (Altona 1832-36). He carried on widespread activity on behalf of Jewish rights in German states, insisting upon complete emancipation without any preliminary conditions of renunciation of the Talmud or orthodoxy, and became the moral and intellectual leader of contemporary German Jewry.

Riesser also participated wholeheartedly in the general liberal movement in Germany. He was an ardent German patriot imbued with the best heritage of German enlightenment and idealism. In 1848 he was elected to the Frankfort Assembly, where he became its second vice president, sitting with the left wing of the liberal center. He supported the idea of a constitutional monarchy under the leadership of Prussia and was a member of the deputation sent to offer to King Frederick William IV the imperial crown. The year 1848 brought greater liberties to the Jews and gave Riesser a wider field of activity. In 1850 he was elected to membership in the German Union Parliament at Erfurt and in 1859 he became judge at the new Upper Court of Hamburg, the first Jew to hold such office in Germany. He served for two years as vice president of the Hamburg parliament.

RIOT

GENERAL AND HISTORICAL ASPECTS. A riot is an outbreak of temporary but violent mass disorder. It may be directed against a particular private individual as well as against public authorities, but it involves no intention to overthrow the government itself. In this respect riot stops short of insurrection or rebellion, although it may often be only a preliminary to the latter. The American, French and Russian revolutions were preceded by persistent rioting. Riots are an index of social unrest. Although their character has varied greatly in different civilizations and historical periods, those which have been truly symptomatic have directly reflected their chief foci of conflict. The most significant types of riots have been religious, political, economic and racial. Such riots are as much a symptom of so-

cial disease as pain is a symptom of biological disorder. The efforts of governments to suppress great popular riots without removing their causes have in the long run failed.

In the Greek city-states riots were a feature of the class warfare which finally destroyed them. In the Roman Empire riots of slaves often passed into servile wars; there was a continuous social struggle between the plebs and the patricians; in the provinces there was resistance to the plundering administrative methods of the Roman governors; in Asia Minor city mobs attempted something like a social revolution; in Alexandria there were Jewish pogroms; while in general there was always a fear of riots from a rabble population when there were breakdowns in the supply of bread or a paucity of games. In Byzantium the games acquired such a political significance that the hippodrome was the scene of political demonstrations and riots which shook the throne. In Rome itself the emperors had no cause to fear the "rabble" as long as the praetorian guard was loyal.

In feudal society the settlement of private quarrels between the armed retainers of great lords could not be suppressed completely. A right of private war had to be allowed to those whose arms were the only force behind the state. But while the Middle Ages tolerated private war peasant riots which threatened the social order were regarded as treason. After the middle of the fourteenth century peasant uprisings throughout Europe became inspired by a spirit half religious and half socialistic. In the sixteenth century in England they ranged from mere collisions between angry mobs and the gentry to small civil wars suppressed only with the aid of foreign mercenaries. The riots which occurred in the mediaeval European towns were partly the result of the struggles of political factions, partly the disorders inherent in early town life and partly the outcome of guild disputes.

The industrial revolution changed the problem of riot. In the country instead of risings of to do peasants, which were not unlike a combination of May Day demonstration and successful strike and which when serious sometimes cost the government a military campaign, there was the sporadic violence of starving laborers. Some of the early industrial riots were directed against machines rather than men. In the towns instead of the brawls and riots between rival families, rival guilds, town and town or natives and foreigners there was a social problem threatening the state itself. In the

country a riot might be checked by the local gentry and their retainers—peasant and agricultural laborers were averse to senseless destruction. But in the towns there was a class of criminals with nothing to lose but their chains.

By the seventeenth century the condition of London was notorious. There were gangs which rejoiced in the names of Muns, Tityre Tus, the Hectors, the Scoureres, the Nickers and the Mohawk. Their gang ruffianism was a symptom of the breakdown of the traditional administrative system for keeping the peace, which, according to Macaulay, had become utterly contemptible. The judicial Silences and Shallows were unable to deal with the Falstaffs, Pyns and Bardolphs when they became gangsters. With the breakdown of the police system the government had to use the military. But these often feared the verdict of a jury should they fire. "The magistrate," said Dr. Johnson, "dare not call the guards for fear of being hanged. The guards will not come, for fear of being given up to the blind rage of popular juries." In 1780 there occurred the famous Gordon anti-Catholic riots and London was in the hands of the mob for a week. Newgate was burned; a camp was formed, cannon were drawn out in Hyde Park and people trembled at the rumor that the lions in the tower and the lunatics in Bedlam were to be released. In 1819 a riot broke out in Manchester at a meeting of some 50,000 people assembled to demand parliamentary reform. Charged rather precipitously by cavalry, the riot has gone down in history as the "Manchester Massacre." In the Bristol riots in 1830 nearly a hundred were killed and wounded. The Chartist riots of 1839 were controlled only by the skill and tact of Sir Charles Napier, who concentrated his 6000 troops and 18 cannon at strategic points, ignoring the clamor of every mayor and master that his own town and factory should be garrisoned. Subsequent riots in England, such as the Trafalgar Square riots in 1888, and the Featherstone riots in 1893-94, have not been of comparable seriousness.
